1870.
GOOD, John Mason, a physician and author, was born at Epping in Essex, 1764, and died in London in 1827. He commenced practice as a surgeon in Salisbury in 1784, but meeting with little success, he removed to London in 1793, principally with the view of obtaining literary employment.

In addition to The Book of Nature, the work by which he is now chiefly known, and which only appeared shortly before his death, he published various poems, translations, and professional treatises. Of his original poems we need say nothing. Amongst his translations we may notice his Song of Songs, or Sacred Idylls, translated from the Hebrew, 1803; his translation of Lucretius, in verse, in 1805; of the Book of Job, in 1812; of the book of Proverbs, in 1821; and of the Book of Psalms, which was just completed at the time of his death. His chief professional work, his Study of Medicine, in four volumes, was published in 1822. It is a learned and amusing work, but by no means a trustworthy guide to the medical student. He likewise published, in conjunction with Olinthus Gregory and Bosworth, the Pantologia, or Encyclopedia, comprising a General Dictionary of Arts, Sciences, and General Literature, in twelve volumes, which were completed in 1813, and contributed largely to various periodicals. His friend, Dr Olinthus Gregory, published a Memoir of his Life in 1828.

GOOD BEHAVIOUR, a phrase rather popular than legal. It is used chiefly as synonymous with keeping the peace. Thus, if one person assaults another, or threatens or provokes him to a breach of the peace, the offence is punishable summarily by justices of the peace, who, besides inflicting a fine, may, and often do bind over the offending party to keep the peace, and be of good behaviour for a period of six or twelve months. The mode of doing this is by requiring the offending party to enter into his recognizances with or without sureties, which is, in fact, the giving a bond for a specified sum to the crown, and if it is broken, that is, if the recognizance is forfeited, then the party may be again punished.

GOOD-CONDUCT PAY is an addition made in the British army to the daily pay of corporals and private soldiers, in consideration of long service unaccompanied by bad behaviour. The amount awarded at one time is 1d. a day, with one white chevron on the arm as a badge of distinction. Successive awards of good-conduct pay may raise the total grant to 6d. a day, with a corresponding number of stripes on the arm.

In each regiment there is kept a ‘Regimental Defaulters Book’, in which the commanding officer is bound to enter the name of every soldier in the corps who shall have been convicted by court-martial of any offence, or who, in consequence of misconduct, shall be subjected to forfeiture of pay, either with or without imprisonment, or to any other punishment beyond seven days’ confinement to barracks. No first or subsequent 1d. of good-conduct pay can be awarded to a soldier, unless two continuous years have elapsed without his name being thus recorded; and if he have the misfortune to come within the provisions of this black book while actually in receipt of good-conduct pay, he loses for each offence 1d. per diem, which can only be restored after one uninterrupted year of good service, during which his name has not been recorded in the defaulters’ book. The loss of the 1d. is of course accompanied by the loss of the corresponding distinguishing mark or stripe.

The first 1d. is obtainable after three years’ service, the last two having been passed through without the name once appearing in the defaulters’ book; the second, after 8 years; the third, after 13 years; the fourth, after 18 years; the fifth, after 23 years; and the sixth, after 28 years; the service being only reckoned in any case from the age of 18, and two years of uninterrupted good conduct immediately before the time at which the award is granted being requisite in every instance. As an additional inducement to continuous good behaviour,
GOOD FRIDAY—GOODENIACIÆ.

14 uninterrupted years without an adverse entry entitles a soldier, after 16, 21, or 26 years' service, to the award for which he would otherwise be eligible after 18, 23, or 28 years.

Non-commissioned officers do not receive good-conduct pay; an addition instead of 2d. a day being made to their regular pay a few years since. A sum, however, not exceeding £1400 a year is distributed among sergeants of long service and good conduct, in the way of annuities, not over £120 a year. The annuity is receivable during active service, and also in conjunction with the pension on retirement.

In the Ceylon Rifles, the Gold Coast Artillery, and the Malta Penitent Artillery, good-conduct pay is allotted to the native soldiers for similar periods of service, but to only half the above amount.

A considerable increase of the army causes a large decrease in the sum payable for good-conduct pay, as the older soldiers become non-commissioned officers, and the ranks are swelled by young recruits, who have not yet had time to earn these extra rewards. The total charge in the army for good-conduct pay during the year 1862-1863 is estimated, exclusive of the annuities to sergeants, at £160,622.

Good-conduct pay and badges are also awarded in the navy to seamen of exemplary conduct; but the periods for obtaining, and the rules under which it is granted and forfeited, are nearly resculable those in force for the army, that a separate description is unnecessary. The leading differences are, that the grant is limited to three badges, and 3d. a day; that petty officers continue to hold it; and that a larger portion of the amount in the pension given at the expiration of active service.

GOOD FRIDAY, the Friday before Easter, is sacred as the commemoration of the crucifixion of our Lord. This day was kept as a day of mourning and solemn justice from a very early period. It was one of the two paschal days celebrated by the Christian Church, and in memory of the crucifixion, was called by the Greeks Pascha Staurostasion, or the 'Pasch of the Cross.' That it was observed as a day of mourning and of solemn and melancholy ceremonial, we learn from the apostolic constitutions (b. v. c. 18), and from Eusebius (EccL Hist. b. ii. c. 17), who also tells that, when Christianity was established in the empire, Constantine forbade the boats, ships, and vessels used in the public proceedings upon this day. In the Roman Catholic Church, the service of this day is very peculiar; instead of the ordinary mass, it consists of what is called 'The Mass of the Presanctified,' the sacred host not being consecrated on Good Friday, but reserved from the preceding day. The priests and attendants are robed in black, in token of mourning; the altar is stripped of its ornaments; the kiss of peace is omitted, in deprecation of the kiss of the traitor Judas; the priest recites a long series of prayers for all classes, orders, and ranks in the church, and even for heretics, schismatics, pagans, and Jews. But the most striking part of the ceremonial is in memory of the crucifixion, and the commemoration of the same, 'adoration of the cross,' or, as it was called in the old English popular vocabulary, 'creeping to the cross.' A large crucifix is placed upon the altar with appropriate ceremonies, in memory of the event which the crucifix represents, and the entire congregation, commencing with the celebrant priest and his ministers, approach, and upon their knees reverently kiss the figure of our crucified Lord. In the eyes of Protestants, this ceremony appears to partake more strongly of the idolatrous character than any other in the Roman Catholic ritual; but Catholics earnestly repudiate all such construction of the ceremony. See IDOLATRY.

IMAGES. The very striking office of 'Tenor.' is held upon Good Friday, as well as on the preceding two days; it consists of the matins and lauds of the office of Holy Saturday, and has this peculiarity, that at the close all the lights in the church are extinguished except one, which time (as a symbol of our Lord's death and burial) is hidden under the altar.

In the English Church, Good Friday is also celebrated with special solemnity. Anciently, a sermon was preached at St Paul's Cross on the afternoon of this day, at which the lord mayor and aldermen attended. The practice of eating upon this day 'cross buns'—cakes with a cross impressed upon them—is a relic of the Roman Catholic times, but it has lost all its religious significance. In England and Ireland, Good Friday is by law a dies non, and all business is suspended. In Scotland, the day meets with no peculiar attention, except from members of the Episcopal and Roman Catholic communions.

GOOD HOPE. See CAPE OF GOOD HOPE.

GOODALL, FREDERICK, an eminent English artist, the son of Edward Goodall, an engraver of reputation, was born in London, September 17, 1822. His first oil-picture was entitled, 'Finding the Dead Body of John the Baptist.' The Society of Arts awarded him the large silver medal. During the summers of 1838-1842, he visited Normandy and Brittany, and in 1839, when but 17 years of age, he exhibited his first picture at the Royal Academy, 'French Soldiers Wearing Cards in a Cabaret,' 'The Entering Church,' as well as 'The Return from a Christening,' which received a prize of £50 from the British Institution, and others of his early pictures, were purchased by Mr Wells. 'The Tired Soldier,' exhibited in 1842, was purchased by Mr Vernon, and is now in the Vernon Gallery. Some of his French scenes are, 'Veteran of the Old Guard describing his Battles,' 'La Fête du Marriage,' 'The Wounded Soldier Returned to his Family,' 'The Conscript.' In 1844, he went for subjects to Ireland, and subsequently visited North Wales. Among his Irish scenes are, 'Irish Courts,' 'The Irish Piper,' and the 'Death of the Emigrant Ship.' His later efforts have chiefly been directed to English subjects. 'The Village Festival,' one of the best of them, exhibited in 1847, was purchased by Mr Vernon. His 'Hunt the Slipper' (1840), 'Raising the Maypole' (1851), 'An Episode of the Happier Days of Charles I.' (1853), 'Arrest of a Peasant Loyalist—Brittany, 1793' (1855), and 'Crammer at the Traitor's Gate' (1856), also added greatly to his reputation. In 1852, G. was elected an Associate of the Royal Academy.

GOODENIACIÆ, a natural order of exogenous plants, of which about 150 species are known, mostly herbaceous plants, although a few are shrubs, and mostly natives of Australia and the islands of the Southern Ocean, a few being also found in India, Ceylon, and the island of Ascension. The order is allied to Campanulaceæ and Lobeliaceæ, but is destitute of the milky juice which is found in both of these. The corolla is monopetalous, more or less irregular. A remarkable character of this order is that the summit of the style bears a little cup, in the bottom of which the stigma is placed. The flowers of some of the species are of considerable beauty. The young leaves of Scevola fasciculata are used as a salve by the Malays; and the pith furnishes a kind of rice-paper, which they make into artificial flowers and other ornamental...
GOODS AND CHATTELS—GOODWIN SANDS.

GOODS AND CHATTELS, a legal as well as popular phrase in common use, to signify personal property. It is not unfrequently used in wills, but is seldom in every-day conversa.tion; where it is used in wills, it generally includes all the personal property of the testator. In Scotland, the corresponding phrase is goods and gear.

GOODS IN COMMUNICATION, the same given in England to the personal property of a married couple, which is not subject to any deed, but left to the operation of the common law. In England, such a phrase is unknown, for upon marriage, all the personal property which a wife or husband may acquire from the time of her birth, or from the time of her marriage, is and remains her own; and the law in this respect is now the same as it is in England. Hence the phrase goods in communion is less appropriate than it was before 1855. If, however, the husband die, the goods in communion suffer a division on the principle of partnership. Thus, if there are no children, half goes to the widow, and the other half to the next of kin of the husband. If there are children, then one-third goes to the widow, and is often called her "relatives," and the other two-thirds to the children equally, if there is no will; or if there is a will, then one-third to them, called the Legitim (q.v.).

The same division also takes place in England, when there is no will; but this is done in England by the Statute of Frauds, 14 Geo. 2, c. 1, s. 23, called the Statute of Distributions (q.v.), whereas this effect is produced in Scotland not by a statute, but by the common law. Practically, this distinction, though important to be known by lawyers, may seem immaterial to laymen.

Another more important distinction, however, both theoretically and practically, is this: The above division of the goods in communion prevails in Scotland whether the husband has left a will or not. In short, it prevails in spite of his will, and all that a husband having a wife and children can do by means of a will, is to bequeath one-third of his personal estate to strangers. And this third is usually called on that account the Donee Part (q.v.). Thus, in Scotland, on the death of the husband, the wife and children have an indefeasible interest in two-thirds of his personal property, and this inchoate interest during life gave rise to the phrase "goods in communication." In England, on the contrary, the will, if there is one, may carry away all the personal property to strangers, regardless of the wife and children. Hence, the result may be stated shortly thus: in Scotland, a man cannot disinhere his wife and children; whereas in England he can. See other incidents of this distinction in Paterson's Compendium of English and Scotch Law, ss. 674, 748. If there is a marriage-contract or antenuptial settlement between the husband and wife, the rights both of the wife and children may be materially varied, for the rule then is, that the parties may make what arrangement they please by way of contract, and such settlements a fixed sum is generally provided for both the wife and children, in lieu of what they would be entitled to at common law, i.e., where no express contract is made.

GOOD-WILL is rather a short popular expression than a legal term. It means that kind of interest which is sold along with any profession, trade, or business. In reality, it is not the business that is sold, for that is not a distinct thing recognized by the law, but the house, shop, fixtures, &c., are sold, and the trade debts; and along with transferring these, the seller binds himself, either by covenant or agreement, to do everything in his power to recommend his successor, and promote his interests in such business. If the seller acts contrary to such agreement, he is liable to an action. But the more usual course is for the seller to enter into an express covenant not to carry on the same business within 30, 40, or 100 miles, or some specified moderate distance from the place where the purchaser resides. At first, such a covenant was sought to be set aside as invalid, on the ground that it tended to restrain the natural liberty of trade; but the courts have now firmly established that if a definite radius of moderate length is fixed upon, it does not sensibly restrain trade, inasmuch as the person covenanting can go beyond those limits, and trade as much as he pleases. Hence, such limitations are a fair matter of bargain, and upheld as valid. If the party break his covenant, he is liable to an action for damages.

GOODWIN SANDS, famous banks of shifting sands stretching about 10 miles, in a direction north-east and south-west, off the east coast of Kent, at an average distance of 54 miles from the shore. The sands are divided into two portions by a narrow channel, and at low water, many parts are uncovered. When the tide recedes, the sand becomes firm and safe; but after the ebb, the water permeates through the mass, rendering the whole pulpy and treacherous, in which condition it shifts to such a degree as to render charts uncertain from year to year. The northern portion is of triangular form—30 miles long, and 24 in its greatest width; on the northernmost extremity, known as North Sand Head, a light-vessel marks the entrance to this perilous channel. This light is distant about seven miles from Flamborough. In the centre, on the western side, jutting out towards the shore, is the Blunt Head, a peculiar dangerous portion, also marked by a light-ship. The southern portion is 10 miles in length, 21 miles wide at its northern end, and sloping towards the south-west, to a point called South Sand Head, which, being marked by a light-vessel, completes the triangle of dangerous proximity recorded for the benefit of mariners.

From the surface nature of these sands, they have always been replete with danger to vessels passing through the Strait of Dover, and resorting either to the Thames or to the North Sea. On the other hand, they serve as a breakwater to form a secure anchorage in the Shannon, when easterly or south-easterly winds are blowing. The Downs, though safe under those circumstances, become dangerous when the wind blows strongly off-shore, at which time ships are apt to drag their anchors, and to strand upon the perils of the breakers of the
Goodwin, in the slitting sands of which their wrecks are soon entirely swallowed up. Many celebrated and terribly fatal wrecks have taken place here, among which we have only space to enumerate the three line-of-battle-ships, Stirling Castle, Mary, and Northumberland, each of 70 guns, which, with other tenor-of-war, were totally lost during the fearful gale of the 26th November 1703, a gale so tremendous that vessels were actually destroyed by it while riding in the Medway. On the 21st December 1811, a gale, the Aurora, a transport, when 300 perished; on the 17th December 1814, the British Queen, an Ostend packet, was lost with all hands; and recently (January 5, 1857), during a gale of eight days' duration, in which several other vessels were lost, the mail-steamer Violet was destroyed, involving the sacrifice of many lives in the catastrophe. From these dates, it will be seen that the greatest dangers are to be apprehended in the winter months.

These dangerous sands are said to have consisted at one time of about 4000 acres of low land, fenced from the sea by a wall. One well-known tradition ascribes their present state to the building of the Tempest Gate, for the erection of which the funds that should have covered the sea-wall had been diverted; this traditionary account is of little, if any, value. Larchard, in writing of them, says: 'Whatsoever old wives tell of Goodwyn, Earl of Kent, in the time of Edward the Confessor, and his sands, it appeareth by Hector Boethius, the British chronicler, that these sands were mayne land, and some tyme of the possession of Earl Godwyn, and by a great inundation of the sea, these sands were taken thereby, at which tyme also much harme was done in Scotland and Flanders, by the same rage of the water.' At the period of the Conquest by William of Normandy, these estates were taken from Earl Godwin, and bestowed upon the abbey of St. Augustine at Canterbury, the abbess of which, allowing the sea-wall to fall into a dilapidated condition, the waves rushed in, in the year 1100, and overwhelmed the whole. How far this account of the formation of this remarkable shoal can be relied on, is a matter of considerble doubt, the documentary evidence on the subject being scanty and unsatisfactory. A colourable confirmation is, however, to be deduced from the fact of the successive inroads which the sea has made for centuries past, and is still making along the whole east coast of England.

As a precaution, now, in foggy weather, bells in the light-ships are frequently sounded. Difficulty is experienced in finding firm anchorage for these vessels; and all efforts to establish a fixed beacon have been hitherto unsuccessful. In 1846, a lighthouse on piles of iron screwed into the sand was erected, but it was washed away in the following year. As soon as a vessel is known to have been driven upon the sands, rockets are thrown up from the light-vessels, and the fact thus communicated to the shore. The rockets are no sooner recognised, than a number of boatsmen, known all along the coast as 'hollowers,' immediately launch their boats and make for the sands, whatever may be the state of wind and weather. These 'hollowers' regard the wreck itself as their own property, and although during fine weather they hallow a wreck without regard less as well as a wholly idle and inactive life, their intrepidity in seasons of tempest is worthy of all praise.

GOOLE, a thriving market-town and river-port of England, in the West Riding of Yorkshire, is situated on the right bank of the Ouse at its junction with the Dutch River, 22 miles south-east of York. It has only recently risen into importance, and may be said to date the commencement of its prosperity from its establishment as a bonding-port in 1829. It has commodious ship, barge, and steam-vessel docks, a patent slip for repairing vessels, ponds for bonded timber, a neatly-built custom house, and extensive warehouse accommodation. G. has a considerable trade in slip and boat building, sail-making, iron-founding, and agricultural machine-making; it has also several corn-mills, some of which are worked by steam. Coal is largely exported along the coast, and in considerable quantities to London. In 1861, 3340 vessels, of 267,706 tons, entered and cleared the port. Pop. about 5000.

GOOSANDER (Mergus Merganser), a web-footed bird of the same genus with those commonly called Mergansers (q. v.), and the largest of the British species. It is larger than the wild duck; the adult male has the head and upper part of the neck of a rich shining green; the feathers of the crown and back of the head elongated, the back black and gray, the wings black and white, the breast and belly of a delicate reddish buff colour. The female has the head reddish brown, with a less decided tint than the male, and much grayer plumage, and has been often described as a different species, receiving the English name of Dunlinier. Both mandibles are furnished with many sharp serratures or teeth directed backwards (see accompanying illustration), the nearest approach to true teeth to be found in the mouth of any bird. See also Bill. The G. is a native of the arctic regions, extending into the temperate parts of Europe, Asia, and America; in the southern parts of Britain, it is seen only in winter, and then only in severe weather, the females and young migrating southwards in such circumstances more frequently than the old males, and not unfrequently appearing in small flocks in the south of Scotland and north of England; but in some of the northern parts of Scotland and the Scottish isles it spends the whole year. It feeds on fish, crustaceans, and other aquatic animals which its serrated bill and its power of diving admirably adapt it for seizing. The flesh of the G. is extremely rank and coarse, but the eggs appear to be sought after by the inhabitants of some northern countries.

GOOSE (Anser), a genus of web-footed birds, one of the sections of the Limnian genus Anas (q. v.), having, in the head, more high than broad at the base, the upper mandible slightly hooked at the tip; the legs placed further
of geese are kept in some places in England, particularly in Lincolnshire, and regularly plucked five times a year, for feathers and quills. Geese intended for the table are commonly shut up for a few weeks, and fattened before being killed. Great numbers are imported from Holland and Germany for the London market, and fattened in England in establishments entirely devoted to this purpose. Goose-hawks are an esteemed delicacy.

The pâle d'oise or pâle de fum gros of Strasburg, is made from livers in a state of morbid enlargement, caused by keeping the geese in an apartment of very high temperature. Large goose-livers were a favourite delicacy of the ancient Roman epicures.

The Gray Lag G. is the largest of the native British species. The next to it in size, and by far the most abundant British wild gooses, is the Bean G. (A. segetum), a very similar bird; the bill longer, orange, with the base and nail black; the plumage mostly gray, but browner than in the Gray Lag G., the rump dark brown. The wings extend beyond the tail. The habits scarcely differ from those of the Gray Lag G., but the Bean G. is a more northern species. It is common in all the northern parts of Europe and Asia; and great numbers breed in Nova Zembla, Greenland, and other most northern regions. Large flocks are to be seen in many parts of Britain in winter, particularly during severe frosts, but a few also breed in the north of Scotland, and even in the north of England. The Bean G. is easily domesticated, but generally keeps apart from the ordinary tame geese. — The White-fronted G., or Laughing G. (A. albiroter), is a frequent winter visitant of Britain; a native of Europe, Asia, and America, breeding chiefly on the coasts and islands of the arctic seas. It is only about 27 inches in its utmost length. The plumage is mostly gray; there is a conspicuous white space on the forehead. It has been often tamed. — Similar to it in size is the Pink-footed G. (A. brachyrhynchos), a species which has a very short bill. In England it is rare, and a mere winter visitor, but it breeds in great numbers in some of the Hebrides. — The Snow G. (A. hyperboreus) is found in all the regions within the arctic circle, but most abundantly in America, where it migrates southward in winter, as far as the Gulf of Mexico. It is somewhat smaller than the Bean Goose. The general colour of the plumage is pure white, the
GOOSEBERRY—GOOSEBERRY CATERPILLAR.

the berries cannot be grown with great advantage in great parts of the world. Its flesh is greyish esteemed. The *Canada G. (A. Cuneata) is one of the most abundant North American species, thrives in the middle and mountainous latitudes, but in vast numbers in the more northern parts, from which it migrates southwards on the approach of winter. It was introduced into Britain at least 200 years ago, and may now be regarded as fully naturalised. A great ornament of lakes and artificial ponds, from which it makes excursions in small flocks over the surrounding districts. In the uniform breadth of the bill it resembles swans. It is fully three feet and a half from the tip of the bill to the extremity of the tail; but its neck is long and slender, and it does not exceed the common G. in weight so much as in length. The bill, the feet, the head, great part of the neck, the quill-feathers, the plumes of the tail are black; there is a crescent-shaped white patch on the throat, whence this species has received the name of the Brevary G.; the back, wings, and flanks are greyish brown, the breast and belly pure white. The Canada G. has an unmarked single species; the wings are reduced to the most domestic consumption. Its flesh affords great part of the winter supplies of the Hudson's Bay residents, and is much used in a salted state. The China, C., or China G. (A. Ginevrensis or Cynogones), of which the native country is supposed to be Guinea, has long been known in Britain in a state of domestication. It has an elevated knob at the base of the upper mandible, which has obtained it the name of Knobbled Goose. —Other species of goose are noticed in the articles BARKLEY GOOSE and CERESIS; and species closely allied to those noticed in this article are found in India and other parts of the world.

GOOSEBERRY (Grossularia), a sub-genus of the genus Ribes (see CURRANT), distinguished by a thorny stem, a more or less bell-shaped calyx and flowers on 1-3-flowered stalks. —The common G. (Ribes Grossularia) is a native of many parts of Europe, and thrives in wild rocky situations and in thicketts, particularly in mountainous districts; but it is a doubtful native of Britain, although now to be seen in hedges and thicketts almost everywhere. Some botanists have distinguished different species, the chief of which have the berries covered with gland-bearing hairs (staph.) that have the germs covered with soft unicellular hairs, and the berries ultimately smooth: and that which has even the germs smooth (R. Grossularia, R. acrispens, and R. redunatum); but these varieties seem to have no definite limits in nature. The varieties produced by cultivation are very numerous, chiefly in England, where, and particularly in Lancashire, great attention is paid to the cultivation of this valuable fruit-shrub than in any other part of the world. In the south of Europe, it is little known. It does not appear to have been known to the ancients. Its cultivation cannot be usefully referred to an earlier date than the 17th c., and was only in its infancy at the middle of the 18th, when the largest gooseberries produced in Lancashire scarcely weighed more than 10 dwts., whereas the prize-gooseberries of this country now exceed 12 dwts. Many good garden varieties have been produced by the careful selection of these fruits, and their propagation by cuttings, which grow very freely. Any good garden soil suits the gooseberry. It is rather the better of a little shade, but suffers from much. The bushes are trained in various ways, but it is necessary to prune so that they may not be choked up with shoots, whilst care ought to be taken to have an abundant supply of young wood, which produces the largest berries. Besides its well-known wholesomeness and pleasantness, and its use for making wine and jelly, the ripe fruit is used for making wine and vinegar. An effervescense gooseberry wine, which might well claim attention under its own name, is often fraudulently sold as champagne. The use of unripe gooseberries for tarts is invariable the value of this fruit-shrub. The G. season is prolonged by training plants on north walls, and by covering the bushes with matting when the fruit is about ripe. Unripe gooseberries are used in jellies, to correct the sourness, and placed in a cool cellar, to be used for tarts in winter. When the bottles are filled, they are heated, by means of boiling water or otherwise, to expel as much air as possible before they are corked and sealed. Various derivatives have been given of the name G., but most probably the first syllable is a corruption of grosselle, the French name of the fruit, from which also comes the Scotch goose or grouse. In some parts of England, the G. is called a featerberry, because it is considered the most worthy of notice are R. cymobota, a native of Canada, of Japan, and of the mountains of India, much resembling the common G., but cultivated in Asia; R. eleacarum, a native of the north-west coast of America, with smooth, black, globose, acid fruit; R. iriguum, also from the north-west coast of America, with well-flavoured globose fruit, half an inch in diameter; R. darlingianus, a native of Canada, with small, globose, red, green, or purplish berries of an agreeable taste; R. gracile, found in mountain-meadows from New York to Virginia, with blue or purplish berries of exquisite flavour; R. angeler, a Siberian species, with sweet, well-flavoured yellowish or purplish smooth berries; all of which, and probably others, seem to deserve more attention than they have yet received from horticulturists. —The SNOWY-FLOWERED G. (R. nivea), a native of the north-west coast of America, is remarkable for its beautiful white pendulous flowers. Its berries in size and colour resemble black currants, are acid, with a very agreeable flavour, and make delicious tarts. Another species from the same coast, the G. arrow, is very ornamental in pleasure-grounds, and is remarkable for its shining leaves, its flowers with four stamens—another species having five—and the great length of the filaments. —R. saeztile, a native of Siberia, and other species, forming a sub-genus called Botryocarpum, have a character somewhat intermediate between currants and gooseberries, being prickly shrubs, but having their flowers in vases.

GOOSEBERRY, COROMANDEL. See CARMOL.

GOOSEBERRY, PERUVIAN. See Physalis.

GOOSEBERRY CATERPILLAR. the larva of Abraxas grossulariata, a moth of a whitish colour, with yellow streaks, and spotted with black. The larva is beautifully coloured, with black and white stripes. It is about half an inch long, and has a yellow loop with its body. It feeds on the foliage of the gooseberry and currant. —Another moth, of which the caterpillar also feeds on the leaves of these shrubs, is Holca Vinaria. Both the moth and the caterpillar are smaller than the former. But more destructive than either of these is the larva of a saw-fly, Nematus ribesi, which deposits...
its eggs along the ribs on the under surface of the leaves; the larva is green and 'shagreened' with minute black tubercles. Many remedies have been proposed and tried to prevent the ravages of these larvae, of which, perhaps, the best are picking off the leaves observed to be covered with the eggs of the saw-fly, and dusting with powder of white hellebore, which, if carefully and sufficiently applied, is most efficacious, killing any kind of larva.

**Gopher Wood.** The probable identity of the gopher wood of Scripture with the Cypress (q. v.), is maintained partly on account of the qualities of the wood, and partly on account of the agreement of the radical consonants of the names.

**Göppingen,** a small town of the kingdom of Württemberg, is situated on the right bank of the Fils, 27 miles north-west from Ulm, and is a station on the railway from Ulm to Stuttgart. It is an industrious, clean, and flourishing town, possessing a town-hall, a large castle, and mineral baths, and carrying on manufactures of woollen cloth, earthenware, and some trade in wool. Pop. 5620.

**Goral** (Antilope Goral, or Nemorhelus Goral), an animal of the antelope family, inhabiting in large herds the elevated plains of Nepal. It is of a greyish-brown colour, dotted with black, the cheeks white; the hair is short; the horns are short, inclined, recurved, and pointed. It is a wild and fleet animal, and when pursued, takes refuge in rocky heights. Its flesh is highly esteemed.

**Goramy,** or Gourami (Ophromenous olfersi), a fish of the family Anabantidae or Leporidio-branchiidea, a native of China and the Eastern Archipelago, highly esteemed for the table, and which has on that account been introduced into Mauritius, Cayenne, and the French West India Islands. Its form is deep in proportion to its length, the head small, and terminating in a rather sharp short snout, the mouth small, the tail rounded, the dorsal and anal fins having numerous rather short spines, the first ray of the ventral fins extending into a very long filament. It is sometimes kept in large jars by the Dutch residents in Java, and fed on water-plants. It was introduced into Mauritius about the middle of the 18th c., and soon spread from the tanks in which it was at first kept into the streams, multiplying abundantly. The success which has attended the introduction of this fish into countries remote from those in which it is indigenous, holds out great encouragement to other attempts of the same kind. The G. is interesting also on other accounts. It is one of the nest-building fishes, and at the breeding season forms its nest by entangling the stems and leaves of aquatic grasses. Both the male and female watch the nest for a month or more with careful vigilance, and violently drive away every other fish which approaches, till the spawn is hatched, afterwards affording a similar parental protection to the young fry.

**Gordian Knot.** The traditional origin of this famous knot was as follows: Gordius, a Phrygian peasant, was once ploughing in his fields, when an eagle settled on his yoke of oxen, and remained till the labour of the day was over. Surprised at so wonderful a phenomenon, he sought an explanation of it, and was informed by a prophetess of Telmissus that he should offer sacrifice to Zeus. He did so, and out of gratitude for the kindness shown him, married the prophetess, by whom he had a son, the famous Midas. When Midas grew up, disturbances broke out in Phrygia, and the people sent messengers to the oracle at Delphi, to ask about choosing a new king. The messengers were informed that a king would come to them riding on a car, and that he would restore peace. Returning to Phrygia, they announced these things, and while the people were talking about them, Gordius, with his father, very opportunely arrived in the requisite manner. He was immediately elected king, whereupon he dedicated his car and yoke to Zeus, in the acropolis of Gordium (a claim, however, after himself, the knot of the yoke being tied in so skilful a manner, that an oracle declared whoever should unloose it would be ruler of all Asia. When Alexander the Great came to Gordium, he cut the knot in two with his sword, and applied the prophecy to himself.

**Gordianus,** the name of three Roman emperors, father and grandson. The first, **Marcus Antonius G.,** was grandson of Annius Severus, and was descended by the father's side from the famous family of the Gracchi. He was remarkable for his attachment to literary pursuits. After being exiled, in which capacity he celebrated the gladiatorial sports with great magnificence, he twice filled the office of consul, first as the colleague of Caracalla, in 213 A. D.; and second, as the colleague of Alexander Severus. Soon afterwards, he was appointed proconsul of Africa, where he gained the affections and esteem of the people by his modest and gentle manners, his splendid liberality, and his refined literary taste; his old age was spent in the study of Plato, Aristotle, Cicero, and Virgil. The tyranny and injustice of the Emperor Maximus having at length excited a rebellion against his authority in Africa, the imperial procurator there was murdered by a band of nobles who had formed a conspiracy against him on account of his cruelty. G., now in his 80th year, was proclaimed emperor, after having vainly refused the dangerous honour. He received the title of **Africanus,** and his son was conjoined with him in the exercise of imperial authority. The Roman senate acknowledged both, and proclaimed Maximinus, then absent in Pannonia, an enemy to his country. The younger G., however, was defeated in battle by Capellinus, viceroys of Mauritania, before Carthage, and his father, in an agony of grief, put a period to his own existence, having been emperor for little more than a month. In his personal appearance, G. is said to have greatly resembled Augustus.—**Marcus Antonius G.,** grandson of the same name, was raised to the dignity of Cesar along with Pupienus Maximus and Balbinus, who were also elected emperors in opposition to Maximinus; and, in the same year, after all three had fallen by the hands of their own soldiers, Marcus Antonius was elevated by the Praetorian bands to the rank of Augustus. Assisted by his father-in-law, Mithras, a man distinguished for his wisdom, virtue, and courage, whom he made prefect of the
GORDIUS—GORDON.

Praetorians, he marched, in the year 242, into Asia, against the Persians, who, under Shahpur (Sapor), had taken possession of Mesopotamia, and had advanced to Syria and Antioch, which was threatened by them, was relieved by G., the Persians were obliged to withdraw from Syria beyond the Euphrates, and G. was just about to march into their country, when Mithraus died. Philip the Arabian, who succeeded Mithraus, stirred up dissatisfaction in the army against G. by the falsest treachery, and finally goaded on the ignorant and passionate soldiery to assassinate the emperor, 244 A.D. But knowing the great affection which the Roman people had for the gallant and amiable G., he declared in his dispatch to the senate that the latter had died a natural death, and that he himself had been unanimously chosen to succeed him.

GORDIUS, a genus of Annelida, of the very simplest structure; very much threadlike, with no greater marks of articulation than slight transverse folds, no feet, no gills, no tentacles, although there is a knotted nervous chord. The mouth is a mere pore at one end of the animal; the other end or tail is slender, and higher, and has been often mistaken for the head. The species inhabit moist situations, are sometimes found on the leaves of plants, but more frequently in stagnant pools, and in mud or soft clay, through which they work their way with great ease. They often twist themselves into complex knots, whence their name G., from the celebrated Gordin-knot—and many of them are sometimes found thus twisted together; but they are also often to be found extended in the water. The most common species in Britain is G. aquatica, of which the popular name is HAIR-EEL; and a notion still prevails in many parts of the country, that it is nothing else than a horse-hair, which has somehow acquired life by long immersion in water, and which is destined in due course of time to become an eel of the ordinary kind and dimensions; in proof of all which an honest eye-witness is ready to present himself as an eye-witness who has often seen these very slender eels in his walks.

A popular notion prevails in Sweden, that the bite of the G. causes whitlow. When the pools in which the G. lives are dried up, it becomes shrivelled, and apparently lifeless, but revives on the application of moisture. The Abbé Fontana kept one in a drawer for three years, and although perfectly dry and hard, it soon recovered vigour on being put into water. Gordii are extremely common in the Thames.

GORDON, the FAMILY OF. The origin of this great Scottish historical house is still wrapped in some measure of obscurity. Uncritical genealogists of the 17th c. affected to trace its descent from a mythical High Constable of Charlemagne, a Duke of Gordon, who, it was said, flourished about the year 800, and drew his lineage from the Gordoni, a tribe which, taking its name from the town of Gordium, in Macedonia, had settled in Gaul before the days of Julius Cæsar. These fables and fancies have long ceased to be believed. Nor is more credit given to the conjecture that the family, having carried its name from Normandy to England in the train of the Conqueror, soon afterwards passed on from England to Scotland. Nor is it found of any connection between the Gordons of France and the Gordons of Scotland. There is little or no doubt now that the Scottish Gordons took their name from the lands of Gordon in Berwickshire. Their earliest history is buried in the 16th c., so that these lands, together with the arms of three boars' heads, were given by King Malcolm Canmohr (1057—1093 A.D.) to the progenitor of the house, as a reward for slaying, in the forest of Huntly, a wild boar, the terror of all the Morses. But in the 11th c., there were neither heraldic bearings in Scotland nor Gordons in Berwickshire. The first trace of the family is about the end of the 12th c., or the beginning of the 13th c., when it appears in record in the counties of March or Dunbar, and as granting patches of land and rights of pasture to the monks of Kelso. About a century afterwards, it enters the page of history in the person of Sir Adam of Gordon. He is found, in 1305, high in the confidence of King Edward I. of England, holding under that prince the office of joint justiciar of Lothian, and sitting in the English council at Westminister as one of the representatives of Scotland. He seems to have been among the last to join the banner of Bruce, who rewarded his adherence, tardy as it was, by a grant of the northern lordship of Strathbogie. The grant failed of effect at the time; but it was renewed by King David II. in 1357, and by King Robert II. in 1376. Under this last renewal, Sir John of Gordon, the great-grandson of Sir Adam, entered into possession, and so transferred the right and power of all the Morses and Teviotdale to the banks of the Dee, the Deveron, and the Spey. Its direct male line came to an end in his son Sir Adam, who fell at Homildon in 1402, leaving only one child, a daughter, to inherit the name and land, but transmitting his property through two illegitimate brothers—John of Scourdargue, and Thomas of Gordon of Ruthven—to a wide circle of the gentry of Mar, Buchan, and Strathbogie, who, calling themselves 'Gordons,' styled the descendants of their niece Seton-Gordon.

LOPHI OF GORDON AND BADENOCH, EARLS OF HUNTLY, MARQUISES OF HUNTLY, AND Dukes of Gordon.—Elizabeth of Gordon, the heiress of Sir Adam, married before 1468 Alexander of Seton (the son of Sir William of Seton), who, before 1437, was created Lord of Gordon. Their son Alexander, who took the name of Gordon, was made Earl of Huntly in 1445, and Lord of Badenoch a few years afterwards. He acquired by marriage the baronies of Cluny, Aboyne, and Glenmuick in Aberdeenshire; and had grants from the crown of the Highland lordship of Badenoch, and of other lands in the counties of Banff and Moray. He died in 1470, and was succeeded by his second son George, the second earl, who married Annabella, daughter of King James I., and added to the territories of his house the lands of Schivas in Aberdeenshire, and the Boyne, the Enze, and Netherdale in Banffshire. He was chancellor of Scotland from 1498 to 1502, and dying soon afterwards, was succeeded by his son Alexander, the third earl, who enlarged the family domains by the acquisition of Strathaven (or Strathglen) in Banffshire, and of the Barc of Lochaber in Inverness-shire. He commanded the left wing of the Scottish army at Flodden; and, escaping the carnage of that disastrous field, survived till the year 1524. He was succeeded by his grandson George, the fourth earl, under whom the family reached, perhaps, its highest pitch of power. He added the earldom of Moray to its already vast possessions, and long held the great offices of lieutenant of the north and chancellor of the realm. He had the repute of being the wisest, the wealthiest, and the most powerful subject in Scotland. The crown, it is said, was connived at to slip his hands; and, when he died in 1551, the Douglases in the previous age, to awe or overshadow the throne. He was stripped of the earldom of
George, duke of Gordon, was created Marquis of Huntly in 1599. He died in 1636, leaving a character of which we have an instructive sketch by a neighbour and contemporary. 'This mighty marquis,' says the 'northern lastant,' his son George, was 'a high-spirited man, for in time of troubles he was of invincible courage, and boldly bore down all his enemies triumphantly. He was never inclined to war nor trouble himself; but by the pride and insolence of his kin, was diverse times drawn in trouble, which he bore through valiantly. He loved not to be in the laws contending against any man, but loved rest and quietness with all his heart; and in time of peace, he lived moderately and temperately in this diet and still his health and longevity.'  

His eldest son, James, Lord Gordon, in 1636, was created Viscount of Melgund and Lord Aboyne. Three years afterwards, he was burned to death in the tower of Fendredraught. In 1632, his elder brother, George, was made Viscount of Aboyne, and on his succession to the Marquisate of Huntly in 1636, the title of Viscount of Aboyne devolved on his third son, who distinguished himself on the king's side during the wars of the Covenant, and died, it is said, of a broken heart, a few days after the execution of Charles I., in 1649. Lord Charles Gordon, third son of the second Marquis of Huntly, was made Earl of Aboyne in 1660. His great-great-grandson, George, who had been a favourite at the court of Marie Antoinette, succeeded as fifth Earl of Aboyne; in the reign of his father, and as eighth Marquis of Huntly in 1836, on the death of the last Duke of Gordon.

EARS OF Sutherland.—About the year 1512, Adam Gordon, of Aboyne, second son of the second Earl of Huntly, married Elizabeth, the heiress of Sutherland, and in her right became Earl of Sutherland. Neither he nor his wife, it appears, could write their own names. Their descendants, the Lords of Sutherland, from the first Earl of Huntly to the present Lord of Sutherland, have been represented in the name of Gordon through six or seven generations, till the beginning of the 18th c., when they exchanged it for the surname of Sutherland, which had been borne by the Countess Elizabeth before her marriage with Adam Gordon.

LORDS OF LOCHNIVAR AND VIScounts OF KENMURE.—William of Gordon, the second son of Sir Adam of Gordon, who figured in the reign of King Robert I. (1306—1329), had a grant from his father of the barony of Stitchell, in Turriff, and of the lands of Glenesk, in Galloway. He was the progenitor of the knightly family of Lochinvar, which in 1633 was raised to the peerage by the titles of Lord of Lochinvar and Viscount of Kenmure. He was the father of James, the second Earl of Huntly, and his eldest son, who under the name and use of Jacobite song—was beheaded in 1716 for his share in the rising of the previous year. The peerage, which was then forfeited, was restored in 1824, but has been in abeyance since the death of Adam, the ninth viscount, in 1847.

EARS OF ABERDEEN.—Some genealogists have sought to ingratiate this branch upon the parent stem before it was transplanted to the north towards the end of the 14th century. But no evidence has been produced in support of this claim; and modern research holds by the old tradition, that the house descends from one of the illegitimate brothers of Sir Adam of Gordon, who was slain at Homildon in 1402. Its first possession seems to have been Methic on the banks of the Ythan. Patrick Gordon of Methic fell under the banner of the Earl of Huntly at the battle of Arbuthoat in 1443. His son and successor was of sufficient mark to obtain the baronetcy of Aberdeen for one of his younger sons in 1516. The family reached the rank of lesser baron in 1531, and the dignity of knight-baronet in 1642. Its chief, at this last date—Sir John Gordon of Haddo—was the most gallant of the northern cavaliers, was the protagonist of his party, the first of the royalists who suffered death by a judicial sentence. He was beheaded at the cross of Edinburgh by the Covenanters.
in 1644, tresting the name of 'Haddo's Hole' to one of the aisles of St Giles Church, which had been his prison. His son, Sir George Gordon of Haddo, after distinguishing himself at the university and the bar, was made a Lord of Session in 1680, Lord President of the court in 1681, and Lord Chancellor in the following year. He was raised to the peerage in 1692, by the titles of Earl of Abercorn and Duke of Gordon. A short time after that event, Lord Haddo, who had declined continued in the female line till the year 1824, when it was restored to the male line, and the title of Earl of Aberdeen was assumed by the heir apparent, the present Duke of Gordon, who died in 1860, after holding the office of Prime Minister of the United Kingdom from December 1852 to February 1855.

The history of the Gordons was written in the middle of the 16th c, at the request of the fourth Earl of Huntly, by an Italian monk, who found his way to the Cistercian monastery of Kinloss, in Moray. This work, which has not yet been printed, is entitled, Historic Compendium de Orighi et Incremento Gordonum Familiae, Johanne Ferrario, Peadmontano, author, apud Kinlos a.D. 1545, Hildes collectorum. A century later, the Gordons found themselves in a country where gentlemen of their own race, the excellent and accomplished Robert Gordon of Straloch, who died in 1601, before he had completed his Origes et Progressus Familiae Illustrissima Gordoniorum in Scotiae Narratio, it is in six volumes, A History of the Ancient, Noble, and Illustrious Family of Gordon, by William Gordon, of Old Aberdeen, was published at Edinburgh in 1726—1727, in 2 vols. 8vo. A Concise History of the Gordons, written by the Hon. Sir John Gordon, by G. S. Gordon, appeared at Aberdeen, in 1 vol. 12mo, in 1754. The chief value of both books is now in their rarity. A work of much greater merit is the Genealogical History of the Earldom of Sutherland, or, as its author called it, The Genealogie and Peculie of the most Ancient and Noble Family of the Earles of Sutherland, wherein also many particular details are related touching the Surnames of Gordon and the Family of Huntly. This was published at Edinburgh in 1691. It is written in 4 vols. 16mo, by Sir Robert Gordon of Gordonstoun, the fourth son of the twelfth Earl of Sutherland by his marriage with that Lady Jane Gordon (daughter of the fourth Earl of Huntly); Sir Peter, his illegitimate brother, from the intestine troubles of Earl Bothwell, in order that he might marry Mary Queen of Scots. Along with Sir Robert Gordon's work, there is printed a continuation of it to the year 1651, by Gilbert Gordon of Sulchah. We learn from this sequel that the House of Gordon of Gight (claiming descent from a younger son of the second Earl of Huntly), which gave birth, at the end of the 18th c, to the poet George Gordon, Lord Byron, gave birth, at the end of the 16th c, to one of the assassins of Wallenstein, Colonel John Gordon, governor of Egira, in Bohemia.

GORDON, GENERAL PATRICK, one of the most distinguished of the many soldiers of fortune whom Scotland sent to the wars of Europe, was born at Easter Auchleuchries, a bleak homestead on the eastern coast of Abernethy, on the 31st of March 1633. His father, a 'goodman' or yeoman, was a grandson of the family of Gordon of Haddo, afterwards raised to the earldom of Aberdeen. His mother, an O'gillie, who could count kindreds with the noble houses of Deskford and Findlater, was the heiress of Auchleuchries, an estate of five or six petty farms, worth in those days about £360 Scots, or £300 sterling a year, and hopelessly burdened with mortgages. In his fifth year, G. was sent to the neighbouring parish school, where he seems to have got a fair knowledge of Latin. The gates of the university were closed against him by his devotion to the Roman Catholic faith of his mother; and so, at the age of sixteen, he resolved—to use his own words—to 'go to some foreign country, not caring much what pretence, or to what country I should go, seeing I had no known friend in any foreign place.' A ship left Edinburgh in July 1650, bound for Russia. In the summer of 1651, and some Scottish acquaintances or kinsfolks placed him at the Jesuit college of Braunsberg. His restless temper could not long endure the spiritless and austerity of that retreat, and making his escape from it in 1653, he led for some time an unsettled life, until, in 1655, he enlisted under the flag of Sweden, then at war with Poland. During the six years that he took part in the struggle between these two powers, he was repeatedly made prisoner, and as often took service with his captors, until again retaken. He had risen to the rank of captain-lieutenant, when he resolved to try his fortune next with the czar, and, in 1661, joined the Muscovite standard.

Here his services in disciplining the Russian soldiers were duly appreciated, and his rise was rapid. He was made lieutenant-colonel in 1662, and colonel in 1665. Hearing that the death of his rival, the elder huntly, had left his son, the Earl of Huntly, without a title, he wished him to enter the Russian service; the czar, however, sent him on a mission to England, and on his return, he fell into disgrace, for what reason, or how, is not clearly appear. In 1670, he was sent to serve in the Ukraine against the Cossacks; and when these were subdued, he was sent back, in 1677, to defend Tschigirt against the Tartars. His gallant performance of that duty gained him high military reputation and the rank of major-general. In 1683, he was made lieutenant-general; and two years afterwards he obtained leave to visit England and Scotland. King James II. wished him to enter the English service; but it was in vain that he petitioned for leave to quit Russia. In 1688, he was made general, and now began his intimacy with the Czar Peter, who, in the following year, owed to G.'s zeal and courage his signal triumph over the conspirators against his throne and life. Nor was this G.'s only great service to his imperial master. In 1698, he crushed the revolt of the Strelitzea, during which the Czarina, his wife, rode in a chariot, and was not ungrateful, and G.'s last years were passed in opulence and honour. He died at Moscow, in the morning of the 29th November 1699. 'The czar,' says his latest biographer, 'who had visited him five times in his illness, and had been twice with him during the night, stood weeping by his bed as he drew his last breath; and the eyes of him who had left Scotland a poor unfriended wanderer, were closed by the hands of an emperor.' G. kept a journal for the last forty years of his life. It seems to have filled eight or ten thick quarto, of which only six are now known to exist. An abridgment of them, rendered into German, under the title of Tagebuch des Generale Patrick Gordon, was published at Petersburg by Mr. Joseph Robertson, and in 3 vols. 8vo, in 1849—1851—1853, very carefully edited by Dr. Posselt. In 1859, Passages from the Diary of General Patrick Gordon, in the original English, edited by Mr. Joseph Robertson, were printed by the Spalding Club in 1 vol. 4to.

GORDON, LORD GEORGE, celebrated in connection with the London Protestant riots of 1780, the third son of the third Duke of Gordon, was born September 19, 1759. At an early age he entered the navy, and rose to the rank of lieutenant,
but quitted the service during the American war, in consequence of a dispute with the Admiralty relative to promotion. Elected in 1774 M.P. for Luggershall, one of the pocket boroughs disfranchised by the Reform Bill of 1832, he soon rendered himself conspicuous by his opposition to ministers, and the freedom with which he attacked all parties; but though eccentric, he displayed considerable talent in debate, and no deficiency of wit or arguments. When the question of the redistribution of the legislature for the relief of Roman Catholics from certain penalties and disabilities, the Protestant Association of London was, among other societies, formed for the purpose of securing repeal, and in November 1779, G. was elected its president. In June 1780, he headed a vast and excited mob, of about 100,000 persons, which went in procession to the House of Commons, to present a petition against the measure, when he addressed them in a speech calculated to inflame their passions and bigotry. Dreadful riots ensued in the metropolis, lasting for several days, in the course of which many Catholic chapels and private dwellings were burnt, and the mansion of the chief-justice, Lord Mansfield, were destroyed. G. was arrested, and tried for high treason: but no evidence being adduced of treasonable design, he was acquitted. His subsequent conduct seemed that of a person of unsound mind. Having, in 1786, refused to come forward as a witness in a court of law, he was excommunicated by the Archbishop of Canterbury for contempt. In 1787, he was convicted, on two official informations, for a pamphlet reflecting on the laws and criminal justice of the country, and for publishing a libel on the queen of France (Mario Autointetto) and the French ambassador in London. To evade sentence, he retired to Holland, but was seized by revenue officers, and apprehended at Birmingham. Sentenced to imprisonment, he died in Newgate, of fever, November 1, 1793. He had latterly become a proselyte to Judaism.

GORDON, SIR JOHN WATSON, President of the Royal Scottish Academy, son of a captain in the navy, was born at Edinburgh about 1790. He studied for four years under John Graham, director of the Academy of the Trustees for the Encouragement of Manufactures, who showed the usual desire of young artists to become an historical painter, but ultimately turned his attention to portraiture, in which he has achieved a distinguished reputation. G. has always resided in his native city. He first exhibited in the Royal Scottish Academy in 1827, was elected in 1841 an Associate, in 1850 an Academician of the London Royal Academy; and on the death of Sir William Allan, President of the Royal Scottish Academy, when the honour of knighthood was conferred on him, G. is as national in his art as it is possible for a portrait-painter to be—that is to say, he excels in transferring to the canvas those lineaments of character which are conceived to be pre-eminently Scotch. The shrewd, cautious, calculating countenance of the Caledonian has never been so happily rendered. Nearly every man of note in Scotland, and not a few in England, have sat for this portrait to this artist, among whom his best-known works may be mentioned, 'Sir Walter Scott' (1831), 'Dr Chalmers' (1837), 'Duke of Buckingham' (1842), 'Lord Cockburn' (1842), 'Thomas De Quincey' (1843), 'Lord Robartson' (1846), 'Principal Lee' (1847), 'Professor Wilson' (1851), 'Earl of Aberdeen' (1852), and 'the Provost of Peterhead' (1853). The last picture, which is the property of the Merchant Maiden Hospital, Edinburgh, gained for G. the gold medal at the French Exposition of 1855, and may be reckoned as among the happiest examples of portraiture in existence in any country.

GORDON'TIA, a genus of trees and shrubs of the natural order Ternstroemiaceae, having five styles combined into one, which is crowned with five stigmas, a 5-celled capsule, and winged seeds. Several species are natives of America, of which the most important is the LOLLOBY BAY (G. Lantana), which is found in swamps near the coast of the Gulf of Mexico. Most species of considerable extent are often covered with this tree alone. It attains a height of 50 or 60 feet, has oblong, leathery, evergreen leaves, and beautiful, white, sweet-scented flowers, more than an inch in diameter. The bark is much used for tanning. In England, it is cultivated with some difficulty, and generally appears as a mere bush.

GORE, in heraldry, a charge consisting of one-third of the shield cut off by two arched lines, one drawn from the dexter or sinister chief, and the other from the bottom of the escutcheon, meeting in the fess point. A Gore Sinister is enumerated as one of the abstractions or marks of dishonour borne for unkinughtly conduct. See GUSSET.

GORE, Mrs CATHERINE GRACE, an English novelist, was born at East Retford, Nottinghamshire, in 1790. Her father, Mr Moody, was a wine-merchant in moderate circumstances. In 1823, she was married to Captain Charles Arthur Gore, with whom she resided for many years on the continent, supporting her family by her literary labours. These were varied and voluminous to an extraordinary degree, amounting in all to seventy works. She died at Lynnwood, Hants, January 27, 1861. Her first published work was Theresa Marchmont, or the Maid of Honour, published in 1823. Some of her early novels, as the Letter de Crochet, and the Fideleres, were vivid descriptions of the French Revolution; but her greatest successes were her novels of English fashionable life, conspicuous among which are—Gore, or the Adventures of a Coward, and Cecil, a Peer, The Ambassador's Wife, The Banker's Wife, &c. She also wrote a prize comedy, entitled The School for Capacities; Lord Derce of the South, a tragedy; Bond, a dramatic poem; and a poetical moral and descriptive work.

GOREY, a very small island, belonging to the French, is situated immediately south-east of Cape Verde, on the western coast of Africa. It is only about three miles in circumference, contains a town defended by a fort, and covering two-thirds of the entire surface of the island. It is considered by the French as an important commercial entrepôt; its exports are gold-dust, ivory, wax, &c. Population of the island about 7000; of the town (1854), 3042.

GOREY, a small municipal borough and market-town of Ireland, in the county of Wexford, is situated about 2 miles north-north-east of the town of that name, and three miles inland from the coast of St George's Channel. It is an old town, having received its charter of incorporation from James I., and consists mainly of one street of nearly a mile in length. Besides the national school and the savings-bank, the Roman Catholic chapel, with hennery attached, built recently in the pointed style, may be mentioned. G. carries on a considerable trade in agricultural produce. Pop. (1861) 2673.

GORGÉ (Ital. gorgo, throat), the re-opening into any work in fortification, consists of the space...
between the extremities of the two sides, as between the faces of a ravelin, or between the flanks of a bastion. The demi-gorges of a bastion are lines in continuation of the curtains on each side, extending from the extremities of the flanks to the point of intersection of the lines. See also FORTIFICATION.

GORGED. When a lion or other animal has a crown by way of collar round its neck, it is said hereditarily to be gorged.

GÖRGEI, ARTHUR, general commanding-in-chief of the Hungarian army during 1848—1849, was born at Toporcz, in the county of Szépes (Zipis), February 5, 1818, and after a thorough military education, got a commission as lieutenant of the regiment of Palatine Hussars. Finding garrison-life too monotonous, and promotion slow, G. took leave of it, and turned a zealous student of chemistry at Prague. At the outbreak of the revolution, G. hastened to the seat of the first independent Hungarian ministry, offering his services, and was sent to Belgium, where he effected a purchase of arms for the new levies of Honvéd. He first exhibited his great military capacity after the rout of the Prussian and Austrian armies (July 5th), when he was made a general, and conducted the retreat that had to be effected with consummate skill and courage. His raw levies had to be kept together and drilled under the roaring cannon of the enemy; the disaffected officers, many of them foragers, and addicted to monarchy, to be retained under the revolutionary flag; a commissariat to be organised during fatiguing marches and constant fighting. Persian boots were totally destroyed at Mohren, government and diet were fleeing towards the Transylvanian frontier, and the dreary wilderness of the Carpathians threatened to become the tomb of all, in the midst of a winter little less severe than that which destroyed the Grand Army of Napoleon I.

At the end of December 1848, Hungary seemed to be lost; at the beginning of March 1849, G. was conducting a plan for driving the enemy out of the country. After Dembinski's failure as general-in-chief, G. was declared the head of the united army corps of the north (hitherto his own), of the Upper Transylvania, under Klára, and of Szeluck, under Dajnach. Forty thousand men, the finest army Hungary ever had, broke north of the Théiss, and drove the Austrians, with bloody losses, from one position to another. The battles of Hatvan, Bélecz, Isaszeg, Gödöllő, Vác, Nagy-Saáló, were a succession of triumphs. Pesth was evacuated by the Austrians, the siege of Komorn was raised, and before the mouth of April was over, nothing was left in the enemy's hands except a small strip on the western frontier, and the impracticable gorges which surround Titel on the Lower Théiss. Buda, the ancient capital of the realm, well fortified and garrisoned, was to be stormed, and for this the victorious campaign had to be interrupted. The delay was fatal. Russian armies hastened to the rescue of Austria, and regiments of veterans were despatched by Radetzky, the war in Italy being nearly over. The fortress of Buda was carried on the 21st of May, but the flower of the Hungarian infantry was burned among its ruins. In the latter part of June, the Austrian-Russian army, under Haynau and Punatine, beat G. near Zsigari; and the affair at Győr (Raab) resulted in the retreat of the Hungarians close to the walls of the fortress of Komorn. On the 20th of July, a bloody battle was fought near Sziget, where G. gave proofs of indomitable courage. On the 16th of July, a desperate fight took place in and near Vác between Russians and Hungarians. G., after some weeks, arrived in the neighbourhood of Arad with an army decimated by continual fighting, by heavy marches, and by dysentery. At Debreczin the corps of Nagy-Sándor was sacrificed in order to allow an agonising march of a few days. On the 9th of August, the lower army, under Dembinski, was annihilated in the battle of Temesvár, and on the 10th, G. was declared dictator by a council held in the fortress of Arad, under the presidency of Kossuth. But further resistance on the part of the Hungarians was now hopeless, and on the 13th G.'s army surrendered at Világos to Prince Czebestich, commander-in-chief of the Russian forces. This surrender has been often imputed as treachery to Görgei. Whether such an imputation is excusable, may be best judged from the circumstance, that on the day he signed G. had 24,000 men with 140 cannon, and that five armies, with more than 200,000 men and 1000 cannon, were closing upon him from different directions. G. was confined to Klagenfurt, where he is still alive, engaged, as is rumoured, in chemical studies. In 1852, a work was published at Leipzig (a translation of which appeared at London in the same year), under the title, Mein Leben und Wirken in Ungarn in den Jahren 1848 und 1849. How far that work is true is a question G. himself declares.

GÖRGET (Hal. gorgetta, from gorga, a throat), that part of ancient armour which defended the neck.—Also a crescent-shaped ornament formerly worn by military officers on the breast.

GÖRGÖ, or GORGON, according to Homer, a frightful monster inhabiting the infernal regions, the head of which was peculiarly appalling. Hymer and Euripides make mention of only one G., the daughter of Terra, who was slain by Minerva, while Hesiod mentions three Gorgones.—Sheben, Euryale, and Medusa, the daughters of Phorys and Ceo, for which reason they are called likewise the Phorcides. Their habituation, according to the same author, was, to squint at men, in the neighbourhood of Night and the Hesperides; while Herodotus and other later writers place it in Libya. They are represented as girded with serpents with heads erect, vibrating their tongues, and gashing their teeth. Achilleus describes them as winged virgins with brazen claws, and enormous teeth, having two serpents round their bodies by way of girdle. The name G. was given more especially to Medusa. According to later legends, Medusa was originally a
very beautiful, maiden, and the only one of the three sisters who was mortal. But she having become a mother by Neptune in one of Minerva's temples, that virgin goddess was so affronted, that she changed Medusa's hair into serpents, which gave her so fearful an appearance that whoever looked on her was turned into stone. Medusa was killed by Perseus (q. v.), and her head was afterwards placed in the shield of Minerva. Various explanations have been given of the myth both by the ancients and the moderns, but no one in particular can be said to be satisfactory.—Compare Leucosov. Uber die Entwicklung des Gorgonoidals in der Poesie und bildenden Kunst der Alten (Berlin, 1833).

GORGONIA, a genus of zoophytes (An'hzoza), allied to Allegonium (q. v.). The whole structure (polype-mass) is rooted and branching, consisting of a horny central axis with a polypiferous flesh, which when dried becomes a friable crust full of calcareous spicules. The hard stem is composed of concentric layers, probably formed in succession by consolidation of the fleshy substance. The stem is usually brown or black, whilst the flesh, or even the dried crust, often exhibits colours of great brilliancy. The polypes have eight tentacles. Several species of G. are rare British zoophytes; but the species most generally known is G. flabellum, of England, and that Mr Gorham maintained doctrines on the point opposed to those of the Church, and that consequently the bishop had shown sufficient cause for his refusal to institute, and that the appeal must be dismissed with costs. From this decision, Mr Gorham appealed to the judicial committee of Privy Council. The committee complained that the bishop's questions were intricate and entangling, and that the answers were not given plainly and directly. Their decision was in substance as follows; and it must be noted what points they undertook to decide, and what not. The court declared that it had no jurisdiction to settle matters of faith, or to determine what ought, in any particular, to be the doctrine of the Church of England, its duty being only to consider what is by law established to be the doctrine upon the legal construction of her articles and formularies. It appeared that very different opinions as to the sacrament of baptism were held by the promoters of that Reformation; and therefore, in opinion on various points left open were always thought consistent with subscription to the articles; and also, that opinions in no important particular to be distinguished from Mr Gorham's had been maintained without the sanction by many eminent prelates and divines. Without expressing any opinion as to the theological accuracy of Mr Gorham's opinions, the court decided that the judgment of the Arches Court should be reversed. Mr Gorham was accordingly instituted to Bramford Speke, during the two years that the suit was pending, the theological question was discussed with all degrees of ability and acrimony in sermons and pamphlets: and it was expected that if it had not been decided in the other way, a large body of the evangelical clergy, who for the most part hold views more or less in accordance with those of Mr Gorham, would have seceded from the Church.

GORILLA (Troglodytes Gorilla), a great African ape, generally referred by naturalists to the same genus with the chimpanzee, although Prof. iso Liddell Geoffrey St Hilaire has attempted to establish for it a separate genus. It has received the same by which it is now known in consequence of its being supposed to be the same animal which is mentioned in the Peripus of Hanno the Carthaginian navigator, who visited the tropical parts of the west coast of Africa about the year 350 B.C., although it is by no means certain that the G. of Hanno is not the chimpanzees. Vague accounts of apes of great size, and of which very wonderful stories were told, were from time to time brought from Western Africa; but it was not till 1847 that the G. became really known to naturalists, when a skull was sent to Dr Savage of Boston by Dr Wilson, an American missionary on the Gaboon River. Since that time, not only have skeletons and skins been obtained in sufficient number for scientific examination, but information has also procured concerning the habits of the animal in its native haunts. The accounts of the G., given in Du Chaillu's Explorations and Adventures in Equatorial Africa (London, 1861, are regarded by the highest scientific authorities, and particularly by Owen, as in the main trustworthy, notwithstanding all the doubt that has been cast over that traveller's narrative of his adventures; and there is little doubt that they are in accordance with all that we have learned from other sources, and with the inferences to be deduced from the dentition and osteology of the animal.

The G. differs from the chimpanzee in its greater size; the height of an adult male in an erect posture being commonly about five feet six inches or five feet eight inches, although there is reason to think that
it sometimes exceeds six feet. Its strength appears also to be greater in proportion to its size, and even its skeleton indicates very great muscular power both in the jaws and limbs. The bony ridges in the skull above the eyes are extremely prominent; and the skull of the male also exhibits a large occipital ridge on the top of the head. The brain is small. The nasal bones project more than in the chimpanzee, thus producing an approximation to the human face, in a somewhat prominent nose. The lower part of the face, however, projects very much; and besides that the teeth do not form a perfectly uninterrupted series as in man, the canine teeth are very large, particularly in the male, projecting considerably more than an inch from the upper jaw, much larger in proportion than in the chimpanzee; although, on the other hand, the molars bear a greater proportion to the incisors, and thus approach more to the human character.

The breadth at the shoulders is great. There are thirteen pair of ribs. The pelvis approaches the human form more than in any other ape. The arms are not so long as in the chimpanzee, but reach nearly to the knee in the erect position. The lower limbs, although shorter in proportion than in man, are longer than in the chimpanzee. The foot is less turned inward than in the chimpanzee, and is better fitted for walking on the ground; the great toe is a true thumb, as in the chimpanzee, standing out from the foot at an angle of about 60°, and is remarkably large and strong. The hands or paws of the fore limbs are also remarkable for their great size, their thickness, and their strength. The fingers are short, but the circumference of the middle finger at the first joint is sometimes more than six inches.

The G. has a black skin, covered with short dark-gary hair, reddish brown on the head; the hair on the arms longer, that on the arm from the shoulder to the elbow pointing downwards, and that on the fore-arm pointing upwards to the elbow, where a tuft is formed. The face is covered with hair, but the chest is bare. There is scarcely any appearance of neck. The mouth is wide, and no red appears on the lips. The eyes are deeply sunk beneath the projecting ridge of the skull, giving to the countenance a savage scowl, the aspect of ferocity being aggravated by the frequent exhibition of the teeth. The belly is very large and prominent.

in accordance with which character, the G. is represented as a most voracious feeder, its food being exclusively vegetable—partly obtained by climbing trees, and partly on the ground. It is very fond of fruits and of some leaves, as the fleshy parts of the leaves of the pine-apple; and employs its great strength of jaws and teeth in tearing vegetable substances and cracking nuts which would require a heavy blow of a hammer. It is not gregarious in its habits. It spends most of its time on the ground, although often climbing trees. It is capable of defending itself against almost any beast of prey. It has a kind of barking voice, varying when it is enraged to a terrible roar. It inhabits exclusively the densest parts of tropical forests, and is only found in regions where fresh water is abundant. It is much dreaded by the people of the countries in which it is found, although by some of the tribes its flesh is sought after for food. Many strange stories are current among them about its habits, which seem entitled to little regard—as, for example, of its carrying away men and women, and detaining them for some time in the woods—of its lying in wait on the branch of a tree till a man passes beneath, furtively stretching down one of its hinder legs to catch him, and holding him in the grasp of its foot, or rather hand, till he is strangled; and the like.—The G. has not been hitherto tamed, and in an adult state at least, seems very incapable of it. The stories of gorillas tamed by the inhabitants of Western Africa, and used to work for them, are worthy of no credit. The name given to this animal in its native country is Nyom, or Ingenne.

Du Chaillu has described, as discovered by himself, two other species of Troglodistes, the Koolokamba (T. Kodo-kamba) and the Nahiego-Mbonvé (T. calvis), smaller than the G.; the latter remarkable for making an umbrella-like shelter of leaves placed against a branch to protect itself from the rain.

GORILLA, a town of Nepal, stands in lat. 27° 52' N., and in long. 84° 28' E. Originally the
seat of the reigning dynasty of the country, it gives name to a race—a rare note of like for fidelity and value during the period 1857—.

is 53 miles to the west of Khatmandu, the capital of the state.

GÖRKUM (Dutch, Gorinchem), a town and fortress of the Netherlands, in the province of South Holland, is situated on the right bank of the Merwede, at the junction of the Linge with that river, 22 miles east-south-east of Rotterdam. It is well built, has a town-house, several military establishments, and a great transit trade in agricultural produce and fish, especially salmon. Pop. 9,600.

GÖRLITZ, a fortified town of Prussia, in the province of Silesia, is a principal station on the railway from Dresden to Breslau, and is situated on a declivity on the left bank of the Neisse, 52 miles west of Liegnitz. It is well built, is surrounded by old walls, and flanked with towers, the chief of which is the Kaimertrutz, now the guard-house and armoury of the town. Among the many beautiful Gothic churches, the most interesting is that of St. Peter and St. Paul, built 1421—1457, and having five naves, a magnificent organ, and a bell 124 tons in weight. In the north-west of the town is the Kreuzkappele (Chapel of the Cross), an imitation of the Holy Sepulchre at Jerusalem. G. has a fine gymnasium with an excellent library, numerous educational and benevolent institutions, and a theatre. A viaduct upwards of 1,600 feet in length, and 115 feet high, one of the grandest in the north of Germany, here crosses the valley of the Neisse. G. has manufactures of cloth, paper, glass, and tobacco; has extensive weaving and bleaching, and a lively transit trade. In eight cloth factories, driven by water and steam power, 1,380 workers produce 18,148 pieces of cloth annually. Pop. 29,326.

GÖRLITZ PROCESS is the name of a celebrated trial which took place in Germany in 1850. It was occasioned in this way: On the 13th of June 1847, the Countess of Görlitz was strangled by a servant of her own named Johann Stauff, whom she had caught stealing some valuables from an open desk in her sitting room, and her corpse was found a few hours after burned by a combustible stuff heaped upon her. After more than two years of preliminary investigation, the cases was tried before the assizes at Darmstadt, 11th of March 1850, and occupied a whole month. The murderer, who obstinately denied having committed the crime, was tried to him, was condemned to imprisonment for life. But the scientific interest of the case arose from its having led to a discussion on the possibility of the spontaneous combustion of the human body. While the physician, Von Siebold, declared in favour of the possibility, the chemists Bischoff (q.v.) and Liebig (q.v.) sought to demonstrate the opposite opinion, which is generally held by scientific men. See SPONTANEOUS COMBUSTION.

GÖRRES, JAKOB JOSEPH VON, a distinguished German author, was born at Coblenz, January 25, 1776. In common with most of the ancient youth of the time, G. threw himself eagerly into the movement of the French Revolution; became an active member of the clubs and debating societies which sprung up in all the towns upon the French border, and established a newspaper entitled the Red Journal, which was the exponent of the most extreme opinions of the time. In the year 1799, he went to Paris as the chief of a deputation to negotiate the annexation of the Rhineland to the French Republic, but the revolution of the 18th Brumaire put an end to this and all similar dreams. G. returned to Germany, disgusted with politics, quietly settled down in a professorship in his native town, and devoted himself exclusively to literature for several years. His works on art, on physiology, on the laws of organism, and on the relations of faith and science, attracted much attention. In 1806, he published the first part of his well-known collection of German Popular Legends; and in 1808, he published the history of the Asiatic nations, and a further contribution to the legendary literature of Germany. From these studies, however, in common with the great body of the German nation, he was aroused by the hope of liberation from French tyranny, by the reverses of the French arms in the Russian expedition. G. was not slow to appeal to the national sentiment of his countrymen in the Rheinishe Mercury, one of the most spirit-stirring journals which Germany had ever possessed; he became, in truth, the literary centre of the national movement. After the re-establishment of German independence, G. continued the career of a journalist, and addressed himself against the encroachments of domestic absolutism with the same energy with which he had denounced the tyranny of foreign occupation; until, having drawn upon himself the displeasure of the government, he was obliged to go into exile, and afterwards to Switzerland. In 1827, he gladly accepted the professorship of the History of Literature in the new university just then founded at Munich by the liberal King Ludwig of Bavaria. From this date, G. made Munich his home, and his late years were devoted to literature, and in part also to the animated religious controversies occasioned in Germany by the contests between the Archbishop of Cologne and the Prussian government on the subject of mixed marriages and Heresim. See HERESI.

In all these controversies, G., who was an ardent Roman Catholic, took an active and influential part. He was, if not the originalator, at least the main supporter of the well-known Roman Catholic journal, the Historisch-Politische Blätter. His last work of importance was his Christliche Mythol. (Ratisbon, 1836—1843). He died January 27, 1848. See the Historisch-Politische Blätter, 1848, and Weis'skircher Lexicon, vol. iv.

GÖRT, a small but thriving town of Ireland, in the county of Galway, and close to its southern boundary, 17 miles north-east of the county of Connacht. Its trade is chiefly in retail. Pop. (1861) 2,077.

GÖRTSCHAKOFF, a Russian family, traces its ancestry through St. Michael of Tschernigoff (born 1426) to Rubik and Vladimir the Great.—PRINCE PETER G., governor of Smolensk, defended that town two years (1609—1611) against Sigismund of Poland, when it was taken by storm.—PRINCE DAMIRI G., born 1756, was a celebrated Russian poet, and wrote odes, satires, and epistles. He died 1824.—PRINCE ALEXANDER G., born 1764, served under his uncle Suwarrow in Turkey and Poland, displayed great courage at the capture of Praga (a suburb of Warsaw), and was made lieutenant-general in 1798. In the campaign of 1799, he commanded under Korsakov at Zürich, was subsequently made military governor of Viborg, repulsed Marshal Lamoriciere at his attack, and occupied the right wing at the battle of Friedland. Appointed minister of war in 1812, he filled this post to the end of the war, when he was made general of infantry, and retired to private life. He died in 1825.—PRINCE ANDREAS G. served in 1799 as major-general under Suwarrow in Italy; and commanded a division of grenadiers at Borodino, in
1812, where he was wounded. In the campaign of 1813-1814, he commanded the 1st corps of Russian infantry, and distinguished himself at Leipzig and Paris. He was made general of infantry in 1819, and in 1826 retired from active service. Prince Peter G. was born in 1790. Having made the campaigns of 1813 and 1814, he served in Caucasus under General Yermoloff. As chief of the general staff of Wittgenstein in 1826, he was one of the signers of the Treaty of Adrianople. In 1829, he was appointed governor-general of Eastern Siberia, and occupied that important post until, in 1831, he retired from active life. On the outbreak of the Crimean war, however, he offered his services, which were accepted; and at the battle of Alma he commanded the left wing of the Russian troops. He also took part in the battle of Inkermann.

Gortschakoff, Prince Mikhail, brother of the preceding, was born in 1795, commenced his military career as an officer of artillery, and distinguished himself in 1828 at the siege of Silistria and Schumla. Chief of the staff of Count Palben in 1831, he gave proofs of extraordinary valour in the battle of Ostorlenka and at the taking of Warsaw. He was wounded at Grobow, and made general; succeeded Count Toll as chief of the staff of the whole army, was appointed general of artillery in 1843, and military governor of Warsaw in 1846. In 1833, he commanded the Russian forces in the Danubian provinces, crossed the Danube, at Braila, March 23, 1834, occupied the frontiers of Bessarabia, and in March 1835 directed the defence of Sebastopol, attacked by the armies of Great Britain and France. The ability he displayed in this command, his courtesy to the enemy, and his humanity to the wounded and prisoners, have given him an exalted reputation. As a reward for his services in this unsuccessful but still brilliant defence, Prince G. was appointed by the Emperor Alexander II. lieutenant-general of the kingdom of Poland, and was for several years a wise and consolatory representative of his youthful emperor at Warsaw. He died May 30, 1861. Prince Alexander G., Russian diplomatist, brother of the preceding, was born in 1800. He was secretary of the Russian embassy in London in 1824, chargé d'affaires at Florence in 1830, counsellor of the embassy at Vienna in 1832, and envoy extraordinary to Stuttgart in 1841. In 1834, he was charged by the Emperor with the intercourse of Russia in the Vienna conferences; and in 1856 he succeeded Count Nesselrode as Minister of Foreign Affairs.

Goruckpore, a city of Hindustan, in the sub-presidency of the North-West Provinces, and capital of a district of the same name, stands on the left bank of the Japti, which joins, 55 miles further down, the Ghagra from the left, the whole of the intermediate course being navigable. It is in lat. 26° 42' N. and long. 83° 23' E., being 430 miles to the north-west of Calcutta; and it contains about 50,000 inhabitants. The district of G. has an area of 7346 square miles, and a population of 2,376,000.

Gory Dew, a dark red slimy film not frequently to be seen on damp walls and in shady places; often on the whitewashed walls of damp cellars where its appearance is apt to occasion alarm from its resemblance to blood. It is one of the lowest forms of vegetable life, one of the algae of the group Palmaelacia (included in Conteraceae), and nearly allied to the plant to which the phenomenon of Hesperis N. (q.v.) appears to be chiefly owing. Its botanical name is Palmaella eructa. It sometimes extends over a considerable surface, and becomes a tough gelatinous mass. The structure and mode of growth of this and allied plants will be noticed under the head Palmaellaceae. Its characteristic red colour appears also in Homonotus simulans, a nearly allied plant, found in similar situations, but which seems to extend more as an aggregation of cells, not soon melting down into an indefinite slime like the cells of the Palmaella. The prevalent colour of the group, however, is green.

Görz, or Göritz, an important town of Austria, in the crown-land of the Kistland (Counts of Austria) (q.v.), and capital of a district of the same name, is charmingly situated in a fruitful plain on the left bank of the Iszno, about 25 miles north-north-west from Trieste. Among its principal buildings are the old castle of the former Counts of Görz, now used as a prison; and the cathedral, with a beautiful sacristy. G. has extensive sugar-refining, and manufactures of rosoglio, silks, linen, cotton, and leather; it has also a thriving trade in its manufactures and in dried fruits. Charles X. of France died here, November 6, 1847. Top. 14,000.

Goshawk (Asutr), a genus of Falcoidea (q.v.), distinguished from the true falcons by a loke or festoon, instead of a sharp tooth, on the edge of the upper mandible, and by the shortness of the wing which reaches only to the middle of the tail. It is more nearly allied to the sparrow-hawks, from which it is distinguished by its more robust form, by its shorter legs, and by the middle toe not being elongated, as in that genus. The species to which the name G. originally and strictly belongs (A. palmarubus), is very widely diffused over Europe, Asia, the north of Africa, and North America, chiefly inhabiting hilly and wooded regions. It is now very rare in Britain, particularly in England. Although one of those that were called ignoble birds of prey, it was much used for falconry, being easily trained, and very successful in catching such game as is either confined to the ground, or does not rise far from it, or such as is to be found in woods, through the branches of which the G. readily threads its way in pursuit. The G. was thus flown at hares, rabbits, pheasants, partridges, &c. It ordinarily seeks its prey by flying near the ground, and can remain a very long time on the wing. It follows its prey in a straight line, not rising in the air to descend upon it, like the falcon; and when baffled by the object of pursuit entering a wood
and hiding itself in some covert, will perch on a bough, and await its reappearance with wonderful patience for many hours. Its flight is very rapid. The G. builds in trees. Its nest is very large. The female, which is much larger than the male, is about two feet in entire length. Both sexes are of a dark grayish-brown colour, the upper surface of the tail-feathers barred with darker brown; there is a broad white streak above each eye; the under parts are also whitish, with brown bars and streaks. The ages of the species are found in India, South Africa, Australia, &c.

GOSHEN, the name of that part of ancient Egypt which Pharaoh made a present of to the kindred of Joseph when they came to sojourn in that country. It appears to have lain between the eastern delta of the Nile and the frontier of Palestine, and to have been suited mainly for pastoral people, which the Hebrews were. Rameses, the principal city of the land, was the starting-point of the Exodus of the chosen people, who reached the Red Sea in three days. From this and other circumstances, it has been concluded that the Wilde-t-Tuneylod (the valley through which formerly passed the canal of the Red Sea, and at the western extremity of which Rameses was situated) is probably the G. of the Old Testament.

GOSLAR, a small but ancient and interesting town of Hanover, is situated on the border of Brunswick, on the Gose, from which the town derives its name. It is 26 miles south-east of Hildesheim. It was at one time a free imperial city, and the residence of the emperor. Of all the fortifications of which it once boasted, the walls and one tower—the Zwinger, the walls of which are 21 feet thick—were retained. Of the venerable cathedral, the porch (Vorhalle, date 1150) is the sole relic; the corn-magazine is a portion of an old imperial palace; the Gothic church in the market-place dates from 1212; the hotel called the Kaiserworth has eight portraits of German emperors. G. was founded by Heinrich I. about 920; and under Otto I. the mines, for which G. has ever since been celebrated, were opened in 986. The manufactures of G. are unimportant; and the mines of gold, silver, copper, lead, and zinc are nearly exhausted. Pop. 8000.

GOSPEL SIDE OF THE ALTAR, the right side of the altar or communion table, looking from it at which, in the English Church service, the gospel appointed for the day is read. It is of higher sanctity than the ejoisale side, and is ruled by the clergyman of highest ecclesiastical rank who happens to be present. In some cathedrals, one of the clergymen has this special duty to perform, and is designated the Gospeller.

GOSPELS. The expression is derived from the Anglo-Saxon, and means literally good news. The message of Christ, or the doctrine of Christianity, was called the Gospel (to euangelion); and the inspired records by which this message or doctrine have been transmitted to the church in successive ages, have received the name of the Gospels (ta euaggelia). When this name was first distinctly applied to these records, is uncertain. The use of it in Justin Martyr, about the middle of the 2d c., is a subject of dispute. It appears to have been in common use in the course of the third century.

1. Genuineness. The primary and most interesting inquiry concerning the Gospels is as to their genuineness. There are three classes of accounts—externally and internally, of the records of our Lord's life—of his sayings and doings—proceeding in two cases from men who were his apostles and companions (Matthew and John); and in the two other cases from men who, although not themselves apostles, were apostolic in their position and character, the immediate companions and fellow-labourers of the apostles (Mark and Luke.) According to their profession, they were all composed during the latter half of the 1st c.; the Gospels are Gospels, as they are called, probably during the decade preceding the destruction of Jerusalem by Titus (69—70), and the fourth Gospel of St. John near the close of the century. The question as to their genuineness is in the main the question as to the existence at this early period; the special authorship of each Gospel is a comparatively less important question.

It is obvious that the existence of the Gospels within the 1st c. is a point which can only be settled by the ordinary rules of historical evidence. What traces have we of their existence at this early period? As Paley illustrates the matter, we can tell of the existence of Lord Clarendon's History of the Rebellion at a period antecedent to Bishop Burnet's History of his Own Times, by the fact that Burnet quotes Clarendon. If the Gospels existed in the 1st c., therefore, we shall expect to find similar evidence of their existence in the Christian writings of the 2d and 3d centuries. We do find such evidence in abundance during the 3d century. In such writers as Origen and Cyprian, we not only find quotations from the Gospels, but we find the Gospels themselves mentioned by name as books of authority amongst Christians. From the writings of Origen alone, if they had survived, we might have collected, it has been said, the whole text not only of the Gospels, but of the Old Testament too. Of the Gospels, then, there is no question. No one can dispute the existence of the Gospels in the age of Origen, or that immediately preceding—that is to say, in the beginning of the 3d century. But we can ascend with an almost equally clear light of evidence to the time of Irenæus, or the last quarter of the 2d century. The passage in which Irenæus speaks of the Gospels is so significant and important that it deserves to be extracted. 'We,' he says (Contra Haer., lib. iii. c. 1), 'have not received the knowledge of the way of our salvation by any others than those through whom the Gospel has come down to us; which Gospel they first preached, and afterwards, by the will of God, transmitted to us, that it might be the foundation and pillar of our faith.' 'For after our Lord had risen from the dead, and they (the apostles) were clothed with the power of the Holy Spirit descending upon them from on high, were filled with all gifts, and possessed perfect knowledge, they went forth to the ends of the earth, spreading the glad tidings of those blessings which God has conferred upon us. Matthew among the Hebrews published a Gospel in their own language, while Peter and Paul were preaching the Gospel at Rome and founding a church there. And after their departure (death), Mark the disciple and interpreter of Peter himself delivered in writing what Peter had preached; and Luke, the companion of Paul, recorded the Gospel preached by him. Afterwards, John, the disciple of the Lord, who leaned upon his breast, likewise published a Gospel while he dwelt at Ephesus in Asia.' These words are very important and to the point; and elsewhere, Irenæus speaks still more particularly of the several Gospels, and endeavours to characterize them in a somewhat fanciful way, which, if it does not prove his own judgment, at least proves the kind of reception with which the Gospels were regarded in his time. It is equally beyond question, then, that the Gospels were in existence in the end of the 2d c., and that they were attributed to the authors.
The author's evidence disappeared, improbability shewn to the evidence for the genuineness of the Gospels at this stage. Any difficulties that the subject involves begin at a point higher up than this.

The age of Irenæus is the fifth generation from the beginning of the apostolic era—the third from the termination of it. The ascending generations may be characterised as those (4) of Justin Martyr, and (3) of Ignatius and Papias; and (2) of St. John, or the later apostolic age. It is within these three generations, and especially within the third and fourth, that the subject of the genuineness of the Gospels gives any cause for hesitation and discussion.

Some writers as Justin Martyr and Ignatius nowhere quote the Gospels by name. In a fragment of Papias preserved by Eusebius, there is mention of Matthew and Mark having written accounts of the actions and discourses of our Lord; but with this exception there is no mention of the Gospels, or of their authors by name, in these earlier Christian writers. Not only so, but Justin Martyr appeals constantly to sources of information which he styles his “Gospels,” of St. Matthew, St. Luke, or St. John, but Memoirs of the Apostles (apomnemoenata tōn apostolōn). The phrase a koileai evangella (which are called gospels), which follows the former in the common versions of Justin's text, is supposed by many to be an interpolation.

This has given rise to a good deal of discussion as to the effect of Justin Martyr's evidence on this subject. The discussion has been dealt of this nature. Were these Memoirs of the Apostles our Gospels, or were they some other books of information such as Christ's sayings and doings to which he had access? Many German critics have been confident they were not our Gospels; and Bishop Marsh has gone the length of saying, that Justin did not quote our Gospels. The situation, therefore, as to whether Justin Martyr quotes our Gospels, may be said to be the turning-point in the evidence for their genuineness. Although not altogether free from difficulty, it is clear that no reasonable doubt can be entertained that the Memoirs of the Apostles to which Justin constantly refers were not other than our Gospels. This appears conclusively established by the three following considerations: (1) The degree of coincidence which exists between the numerous passages which Justin quotes from his Memoirs, and the corresponding passages in the Gospels.—The verbal coincidence with the text of the Gospels is sometimes exact, and sometimes so nearly so as to appear exact in a translation. The want of entire verbal coincidence is just what might be expected in a writer like Justin, who quotes the Old Testament in the same general manner, and is the very same as we find in other writers, both before and after him. Further, the account which he gives of the origin of the Memoirs corresponds with the origin of the Gospels—viz., that two were written by apostles, and two by compilers of the apostles. (2) The extreme improbability that there could have been other books besides the Gospels of the same apparently authoritative character, all traces of which have disappeared, and of which, in fact, we find no indication save in Justin Martyr.—Everything seems against such a supposition. The books of which Justin speaks were read in the assemblies of the Christians on Sundays; they were regarded with respect and veneration; they were evidently looked upon as authoritative. It is wholly inconceivable, that if there were such books other than the Gospels, they should not have been mentioned by other writers as well as Justin; or that they should have utterly perished. (3) The certainty, from the statements of Matthew, Mark, and Luke, that the division immediately following him, that Justin must have known our Gospels.—In this later generation we find the Gospels everywhere diffused: received and reverenced alike at Alexandria, Lyons, and Carthage; by Clemens Alexanidnus, Irenaeus, and Tertullian. They could not all at once have attained this wide diffusion, or started into this position of authority. The manner in which Irenaeus speaks of them can only be accounted for by the fact, that he bad received them from his teachers; that they had been handed down to him as inspired authorities from the first ages. We must take the light of such a statement with us in ascending to the age of Justin Martyr, and in this light it appears that the Gospels should not have been known to Justin, and consulted by him. The mere fact of his calling his authorities by the peculiar name of Memoirs cannot be set against all this evidence. The name Memoir, used by some of the Gospels, was only a natural one for this writer to use, with his classical prelections and philosophical training, and considering that he was addressing a heathen emperor, and through him the Gentile world at large.

When we have gone beyond the age of Justin, to Ignatius and Papias, we find in a fragment of the latter, as has been already stated, mention of Matthew and Mark having written accounts of the life of the Lord; while in the letters of the former, as in the still earlier Epistle of Clement Romans and the so-called Epistle of Barnabas—both of which belong to the 1st c., and consequently reach the apostolic age itself—we find various quotations that seem to have been made from the Gospels. The quotations from St. Matthew are the most numerous. If these quotations stood by themselves, it might be doubtful how far they constituted evidence of the existence of the Gospels at this early period. They might possibly indicate merely a uniformity of oral tradition as to the sayings of our Lord; but when we regard them in connection with the position of the writers, and the whole train of thought and association in which we find them, to which for no reasonable doubt we could wish tofound on them. The existence and character of such men as Ignatius and Clements are unintelligible save in the light of the Gospel history.

In addition to this chain of direct Catholic evidence for the genuineness of the Gospels, the fragments which have been preserved of heretical writers furnish important, and in some respects singularly conclusive evidence. The Gnostic Basilides quotes the Gospels of St. John and St. Luke about the year 120. The heretics appealed to them as well as the Catholic writers, and in this fact there is a strong guarantee that no fictions or inventions could have been palmed off upon the church in the 2d c., as the most solemn of all Gnostic theory as to the origin of the Gospels virtually supposes. Upon a review of all the evidence from the apostolic Fathers down to the council of Laodicea, when the Gospels were finally fixed into the canon of Scripture, 'there can hardly be room for any candid person to doubt'; it has been said, 'that from the beginning the four Gospels were recognised as genuine and inspired—that a line of distinction was drawn between them and the so-called...
apocryphal Gospels.* As a mere question of literary history, the genuineness of the Gospels certainly rests on far higher evidence than that on which we receive, without hesitation, many ancient writings.

2. Internal Character and Contrast.—After the genuineness of the Gospels, the next point of importance regarding them is the relation which they bear to one another in respect of their contents and arrangement—the coincidences and discrepancies with one another which they present. The most obvious distinction among the Gospels as a whole is between the work of St John and the three Synoptical Gospels, as they are called. Matthew, Mark, and Luke, in narrating the ministry, discourses, and miracles of our Lord, confine themselves exclusively to no means so marked; it is, however, very considerable, and presents some interesting features, which Professor Andrew Norton has set forth clearly in his admirable work on the Genuineness of the Gospels.

It is not desirable to go into further details in this place; but the result of the extremely critical and minute scrutiny to which the text of the Gospels has been subjected may be stated as follows. There is a singular coincidence in substance in the three Synoptical Gospels, be purposely abstained from writing what they had already recorded, and sought to supply such deficiencies as appeared to exist in their records. When we have no knowledge of the subject, this at least seems as probable a supposition as any other. But as a matter of fact, the Synoptical Gospels reveals some interesting results. If we suppose them respectively divided into 100 sections, we shall find that they coincide in about 50 of these, that Matthew and Luke further coincide in 21; Matthew and Mark in 20; and Mark and Luke in 6. This, of course, applies to the substantial coincidence of fact and narrative in each case. The relative verbal coincidence is by no means so marked; it is, however, very considerable, and presents some interesting features, which Professor Andrew Norton has set forth clearly in his admirable work on the Genuineness of the Gospels.

uniform. In the fragment of Papias, and in the statement of Irenaeus—the earliest sources in which we have any distinct mention of the Gospels—it is plainly asserted that Matthew wrote his Gospel in the Hebrew dialect. The fact is made a mark of distinction between his Gospel and the others. The same uniformity of tradition ascribes the Gospel of St Mark to the teaching of St Peter. The Gospel of St Mark is the most summary of the three, yet, in some respects, it is stamped with a special individuality and originality. It describes scenes and acts of Christ and others, that help graphic detail, throwing in particulars omitted by others, and revealing throughout the observant eye-witness and independent historian.

3. Origin.—It is not improbable that the separate inquiry from their genuineness, although intimately connected with it, and springs immediately out of those facts as to the internal agreement and disagreement of the Gospels of which we have been speaking. The inquiry has been treated in an extremely technical manner by many critics, and it would not suit our purpose to enumerate and examine the various theories which have been propounded on the subject. We may only state generall,y, that the object of freemasonry, writing what they had already recorded, and sought to supply such deficiencies as appeared to exist in their records. When we have no knowledge of the subject, this at least seems as probable a supposition as any other. But as a matter of fact, the Synoptical Gospels reveals some interesting results. If we suppose them respectively divided into 100 sections, we shall find that they coincide in about 50 of these, that Matthew and Luke further coincide in 21; Matthew and Mark in 20; and Mark and Luke in 6. This, of course, applies to the substantial coincidence of fact and narrative in each case. Peter at Caesarea (Acts x. 34) may give some imperfect idea of the character of this preaching. The facts thus briefly indicated would expand in frequent communication to something of the more detached and living form which they exhibit in the Gospels, or rather in what we may suppose to have been the common substructure or groundwork of the Gospels. It is to be remembered that the apostles were promised that the Holy Spirit would come upon them to call and remunerate, whatsoever the Lord had said unto them. And this constant guidance and superintendence of the Divine Spirit would sufficiently account for the uniformity and consistency of their oral instruction, even although not reduced to writing for a considerable number of years. Allowing for the widest space of years it may be necessary to assume before the writing of the first Gospel, the chief apostles themselves are yet living at the end of this space. It is not a mere tradition of their teaching that survives, but it is their own living witness that is circulated from church to church, as they pass to and fro in their evangelistic labours. In order to try whether this hypothesis of the origin of the Gospels be really the correct one or not; all we need to say is, that it seems to possess more probability in itself than any hypothesis of a common written source, from which they might have nominally borrowed, and which has disappeared. It fits, moreover, into the facts of the case.—Westcott, Introduction to the Study of the Gospels, p. 189.

According to this view of the origin of the Gospels, that of St Mark, if not the oldest in composition, is yet probably the most direct and primitive in form. In its lifelike simplicity and comparative unconsciousness of aim, it represents most immediately the apostolic preaching; it is the testimony delivered by St Peter, possibly with little adaptation. Historical evidence, as we have already said, is uniform as to the association of Mark and Peter; Mark is everywhere interpres Petri. The Gospels of St Matthew and St Luke, again, represent the two great types of recension to which it may be supposed that the simple narrative was subjected. St Luke represents the Hellenic, and St Matthew the later Hebraic form of the tradition, and in the present case the latter seems to give the last authentic record of the primitive Gospel.

A common oral Gospel seems also to present the most natural explanation of the accords and variations of the three Synoptic Gospels. The words of the Lord, which present in it such a marked uniformity, would necessarily assume a more fixed character in such an oral tradition, while the narrative surrounding them would remain comparatively free. Single phrases of a peculiar and important character would be closely retained; there would be, exactly as we find, a uniform strain of hallowed language mingling with variations in detail—a unity of tone, and even of speech, with variety of modulation and emphasis.

This theory of a common oral origin of the Gospels is of course widely separated from the well-known Tubingen theory, which carries the period of tradition down to the middle of the 2d c., and supposes that the Gospels have been altered by the influence of opposing teachers. The facts of the case, as well as the evidence for their genuineness, which we have already quoted, are wholly opposed to such a supposition, for in this case the reproduction of the Gospels would be wholly ideal. There might be a ground of fact in the mere existence of Jesus of Nazareth, but the picture of His life and death would be merely the imaginative dream of men intoxicated by religious enthusiasm. And this is the Tubingen explanation of the rise of Christianity! It may be surely said that there never was a more inadequate explanation of a wonderful historical phenomenon: for how was the Jewish mind, in its feebleness and decay, capable of conceiving such an ideal as the life and character of Christ? Their inspired origin in the 1st c., and as the records of a life and death witnessed by the apostles, is—whatever difficulties it may present—the conclusion alone which is warranted by impartial historical inquiry. The reader who desires further information on the subject may consult Professor Norton’s work on the Genuineness of the Gospels, and Westcott’s Introduction to the Study of the Gospels.

GOSPORT (‘ Go’s port’), a market-town and seaport of England, in the county of Hants, stands on the western shore of Portsmouth Harbour, and directly opposite Portsmouth, with which it is connected by a floating bridge. It is 14 miles south-east of Southampton, and 50 miles south-west of London by the London and South-Western Railway. It is enclosed within ramparts, which seem a portion of those which also surround Portsmouth and Portsea. The Haslar Gun-boot Ship-yard, constructed with the town, is used for building and keeping in repair all the gun-boats belonging to this port. An extensive iron foundry for the manufacture of anchors and chain-cables, and considerable coasting-trade are here carried on. The main feature of G., however, is the Royal Clarence Vitualling Yard, which contains a brewery, a biscuit-baking establishment worked entirely by steam, and numerous storehouses. The bakery can turn out ten tons of biscuit in one hour. In the immediate vicinity is Haslar Hospital, founded in 1762, the chief establishment in Great Britain for invalid sailors, of whom 2000 can be accommodated and supplied with medical attendance. Pop (1861) 22,616.

GOSSAMER, a light filamentous substance, which often fills the atmosphere to a great degree during fine weather in the latter part of autumn, or is spread over the whole face of the ground, stretching from leaf to leaf, and from plant to plant, loaded with entangled dew-drops, which often, though not always, are draped with the sunbeams. Many opinions were formerly entertained concerning the nature and origin of gossamer, but it is now sufficiently ascertained to be produced by small spiders, not, however, by any single species, but by several, not improbably many species; whilst it is also said to be produced by young, and not by mature spiders, a circumstance which, if placed beyond doubt, would help to account for its appearance at a particular season of the year. The production of gossamer by spiders was first demonstrated by the observations of Dr Hulse and Dr Lister in the 17th c., but those observations did not for a long time meet with due regard and credit, particularly amongst the naturalists of Continental Europe. It is not yet well known if the gossamer spread over the surface of the earth is produced by the same species of spider which produce that seen floating in the air, or falling as it from the clouds. Why gossamer threads or webs are produced at all, and whether that production not very easily answered. That they are meant merely for entangling insect prey, does not seem probable; the extreme eagerness which some of the small spiders known to produce them shew for water is a fact which has led to the supposition that the dew-drops which collect on them may be one of the objects of the formation of those on the surface of the ground, whilst it has been also supposed that they may afford a more rapid and convenient medio
GOSSYPIUM—GOTHIC ARCHITECTURE.

of transit from place to place than the employment of the legs of the animal. As to the gossamers in the air, conjecture is still more at a loss. They are certainly not accidentally wafted up from the ground, as might be supposed; the spiders which produce them are wafted up along with them; but whether for the mere enjoyment of an aerial excursion, or in order to find insect prey in the air, is not clearly ascertainable. The whole, the most probable. The threads of gossamer are so delicate that a single one cannot be seen unless the sun shines on it; but being driven about by the wind, they often become beaten together into thicker threads and flakes. They are often to be felt on the face when they are scarcely visible. The spiders which produce these threads shoot them out from their spinnerets, a viscid fluid being ejected with great force, which presently becomes a thread; sometimes several such threads are produced at once in a radiating form, and these being caught by the ascending current of heated air, are borne up, and the spider along with them. It would seem that the spider has some power of guiding in the air the web by which it is wafted up.

GOSSYPIUM. See COTTON.

GOTHA, a town of Germany, capital of the duchy of Saxe-Coburg-Gotha, is situated on an elevation in a beautiful district on the right bank of the Leine, 18 miles west of Erfurt, by the Thuringian Railway. It is a handsome, well-built town, is quadrilateral in form, and was formerly surrounded by walls, which, however, have been thrown down, and public walks laid out in their place. The principal public building is the large ducal palace of Friedenstein, with two large salerooms, and two towers of 144 feet in height. This palace contains a picture-gallery, in which Cranach, V. Eycck, Holbein, Rubens, and Rembrandt are represented; a cabinet of engravings (a very valuable collection); a library (founded by Ernst the Pious in 1549) of 150,000 volumes and 6000 manuscripts, among which are 2000 Arabic, and from 300 to 400 Persian and Turkish; a collection of about 80,000 coins and 13,000 medals, one of the finest collections in Europe; and a Japanese and Chinese museum. G. has also an arsenal, a new and old town-hall, and numerous educational and benevolent institutions. The principal manufactures are muslins, cottons, percale, coloured paper, cloth, linens, table-cloths, and table-linen, lace, print, embroidery, &c. Gothic sausages have a widespread celebrity. Several hundreds of designers, engravers, printers, and colourers of maps are employed here in Justus Perthee's large geographical establishment. Pop. 13,700.

GOTHA, ALMANACH DE, a universal political register, is published annually at Gotha (q. v.). The publication of this almanach commenced in 1764, in the German language, in which it was continued until Napoleon I became emperor, when it was changed to the French language, in which it has been continued to the present time. The almanach is a small pocket volume, containing at present nearly one thousand pages of small type, and recording the sovereigns and royal families of every civilised country, with the civil, diplomatic, military, and naval officers, a great amount of statistical information, a compact summary of historical events, obituary notices of the most distinguished persons, and other matters of political interest. No book ever printed contains so much political and statistical information in so small a compass. The boundaries of states are given according to the latest treaties, with their extent, population, and revenues. The annuaire diplomatique contains the name of every diplomatic representative and attaché of Europe and America. The pay of officers of governments, national expenditure and debts, with the interest, the number of its representatives and under representatives, governments, and their proportion to the population, are carefully given. As a work of such an extent cannot be brought down to the end of the year, the date of publication is stated, and in some instances a date has been given for each person who died, to show that the editor is not answerable for subsequent changes. When the Almanach de G. was commenced, there was but one republic in existence—that of Switzerland. It was then little more than a register of the crowned heads and royal families of Europe. It has been slow to recognise political changes, and for many years after the French Revolution, continued to print under the head of 'France,' Louis XVII. as the reigning monarch. It was not until Napoleon became emperor that his name found a place in its pages, and then his whole family was given, as with the other royal houses. It was at this period that the language was changed to French, which, being the recognised language of courts, is found the most convenient, and has been ever since retained. During the Empire, Napoleon I. considered this little publication so important, that he exercised over it a rigid supervision, and in 1818, an entire change was made, which had just been brought off, was seized by a body of French gendarmes. The editor hurried to Paris, and found that his errors were in his alphabetical arrangement, which Anhalt, of the Ernestine line of Saxon princes, took precedence of Napoleon, who declared, to the heat to be placed at the head of the nobility of the Rhine. To secure this re-arrangement of the alphabet, the edition of that year was printed at Paris. It is probable that this supervision of the press kept out of the historic pages the succession of the allies against the Empire in the succeeding numbers, in which there was no mention of the campaigns of the Peninsula and the victory of Trafalgar. Or: the restoration of the Bourbons, however, the events were recorded in a résumé, which made up for the previous omissions.

GOTHA, DUCHY OF. See Saxe-COBURG-Gotha.

GOTHARD, Sr, a mountain group in the Helvetic Alps, reaches in its highest peaks the height of 12,000 feet. See AND. St G., however, is chiefly famous for the pass over the Alps, which is its summit range, at the height of 8080 feet. By means of this pass, the high-road from Fluelen, on Lake Lucerne, is carried without interruption in a south-south-east direction to Lago Maggiore, in the north of Italy. The construction of the road was commenced in 1820, and opened in 1822. In 1834, near one-third of the road, with numerous bridges and terraces, was swept away by the violence of a most terrific storm which burst on the summit of the pass; and in 1839 a similar occurrence took place. Since that time, however, the road has been in a good state of repair. It is one of the best and most convenient of the Alpine carriage-ways, is free from snow for four or five months of the year, beginning with June, and is equal, if not superior, to any other in the interest and grandeur of its scenery.

GOTHIC ARCHITECTURE. Under this title are comprised the various styles of architecture which prevailed in Western Europe from the middle of the 12th century to the beginning of the 16th century. The term Gothic was at first bestowed by the Renaissance architects on the medieval styles as a term of reproach. This epithet they applied to every kind of medieval art which had existed from the decline of the classic styles
GOTHIC ARCHITECTURE.

till their revival, all else being by them considered as barbarous and Gothic. The name has now, however, become generally adopted, and has outlined the reappraisal at which it is implied. It has also become limited and defined in its application. During the present century, the arts of the middle ages have been attentively studied, and their origin and history faithfully traced; and its primary knowledge of these styles has increased, a feeling of admiration has succeeded to that of contempt, and Gothic now ranks as one of the noblest and completeest styles of architecture ever invented.

Origin.—The origin of Gothic architecture has given rise to many very ingenious speculations. It has been said that the style was copied directly from nature; that the pointed arches and groins of the vaults were imitated from the overarching branches of trees; and that the stems of an avenue were the originals of the pillars of the Gothic aisles. Others have strenuously maintained that the invention of the pointed arch was a mere accident, arising from this form having been observed in the interlacing of the circular arches of a Norman arcade. It has also been stated that the style was imported from the East during the Crusades, and that the medieval architects had but little to do with its origin.

More careful study of the Gothic buildings which remain to us, has dispelled these fanciful ideas, and settled the origin and progress of the art on historical as well as internal evidence. To trace up to its primary elements, we should have to go far back in the world's history. Some maintain that there are only two styles of architecture of which we have any knowledge—viz., Greek architecture and Gothic architecture; that these are the most typical styles, and that in them are contained all the elements of which all other styles are composed.

This is no doubt to some extent true, just as it is also true that all things in nature are derived from a few primary elements. But as there are many varieties in nature, so there are many developments of the two typical forms of architecture, all of which deserve to be classed as styles.

Greek architecture is the type of the traslated style—i.e., the style whose principal feature is the straight lintel; Gothic is the type of arcuated architecture, in which the voids are spanned by arches. Of these typical forms there are many varieties. For instance, there is the Romanesque style, which is a transition form; there is the Roman style, which may have contributed to the general progress of the art; but as might be expected, it is to the banks of the Rhine where the successors of Charlemagne chiefly dwelt, that we must look for the first step in the development of Gothic architecture. The following short sketch of the development of vaulting will shew how this occurred.

The Roman basilicas, and, like them, the early Christian churches (fig. 1), were divided into a central nave with two side-aisles, the former separated from the latter by a row of columns on each side. These columns carried arches on which rested the side walls of the nave, which were carried sufficiently high into the roof by the rows of clerestories, and admitted windows to light the central nave. This row of clerestory windows afterwards became the Gothic clerestory (q. v.). The arch at the end of the nave was semicircular on plan, and was usually roofed with a vault in the form of a barrel or semi-dome. This feature was also afterwards more fully developed in the chapels of Gothic churches. The nave and side-aisles were originally roofed with wood, but, owing to their frequent destruction by fire, it became necessary, i.e., to cover the church with a more enduring kind of construction. Vaulting, was then

To the Romans, therefore, is due the introduction of an arcuated construction with a well developed internal, and a partially developed external decoration. The early Christians adopted their forms of construction and decoration from the Romans. They were also indebted to them for the plans of the buildings, which became the types of the Christian sacred внутrioned styles. The Basilica (q. v.), or Roman court-house and market-place, was found to be admirably adapted for early Christian worship, and the circular temples were the prototypes of the Christian Baptisteries (q. v.) which usually accompanied the basilicas. In erecting their buildings, the Christians not only adopted the plans and mode of construction, but used the actual materials of the buildings of the Romans, many of which had been destroyed by the barbarians. Where such materials were abundant—such as in Rome and Central Italy—the early Christian architecture very closely resembled that of the Roman buildings which had preceded it. But in more remote districts the builders, finding no ready-made materials at hand, had to design and prepare new ones. In doing so they followed as closely as they could the Roman originals, but their buildings partook more of the constructional than the decorative elements of Roman architecture. The Roman form was dropped out of use; and when, in process of time, decoration was desired, each new people followed its own ideas. The traditional Roman decoration thus became to a great extent lost, and new styles in decoration arose. These new styles were, in some of the original Roman forms and modes of construction; and each style depended for its peculiar character on the particular Roman forms it retained and developed. Thus Constantine, and the architects of the East, sought to be as the distinguishing feature of their style, and the architects of Lombardy adopted the plain tunnel-vault. The former style is called Byzantine (q. v.), and has been the type of all Eastern medieval architecture; and the latter Romanesque (q. v.), and has been the origin of all the western architecture of medieval Europe.

History.—From Lombardy—in those ages part of the German empire—the Romanesque passed into Germany and Switzerland, and was also most naturally adopted in the south of France, where examples of Roman architecture abounded. This architecture was carried out with various modifications and in different countries, all of which may have contributed to the general progress of the art; but as might be expected, it is to the banks of the Rhine where the successors of Charlemagne chiefly dwelt, that we must look for the first step in the development of Gothic architecture. The following short sketch of the development of vaulting will shew how this occurred.

The Roman basilicas, and, like them, the early Christian churches (fig. 1), were divided into a central nave with two side-aisles, the former separated from the latter by a row of columns on each side. These columns carried arches on which rested the side walls of the nave, which were carried sufficiently high into the roof by the rows of clerestories, and admit windows to light the central nave. This row of clerestory windows afterwards became the Gothic clerestory (q. v.). The arch at the end of the nave was semicircular on plan, and was usually roofed with a vault in the form of a barrel or semi-dome. This feature was also afterwards more fully developed in the chapels of Gothic churches. The nave and side-aisles were originally roofed with wood, but, owing to their frequent destruction by fire, it became necessary, i.e., to cover the church with a more enduring kind of construction. Vaulting, was then
introduced, the Roman forms, of which many examples existed, being at first closely followed. To trace the progress of vaulting from the simple tunnel-vault of the Romans to the fully developed and magnificent groins of Gothic cathedrals, is a most interesting inquiry; and, indeed, includes the history of the development of Gothic architecture. There is one consideration which will help to explain how the Roman arches were abandoned and new forms sought out. To the Roman emperors who built the splendid vaults of the baths, and who had a subdued world at command, material and labour were a small consideration. They could, therefore, afford to build in a style which required perfect materials and workmanship. But medieval princes and bishops could obtain neither, except with great cost and trouble; to economise these, therefore, great skill and attention were required. It was necessary to study to avoid those large and expensive materials of which the Romans were so lavish, and to adopt the simplest and easiest forms of construction. The first vaults tried were simple semicircular tunnel-vaults. It was found that these, besides being very gloomy, required very massive walls to resist their thrust. An attempt was then made to relieve this thrust by transverse arches (a, a, fig. 2) thrown across—at intervals—under the tunnel-vault, to act as strengthening arches. Buttresses with a slight projection were applied outside to support these, and a beam of wood was sometimes introduced at the wall-head from buttress to buttress to assist in opposing the thrust of the vault.

This was the first attempt to throw the weight of the vault on single points. In the side-aisles, where the span was small, the Roman intersecting vaults (b, b, fig. 2) were used; and as the roofs with tunnel-vaulting were found very gloomy and ill-lighted, it was desirable that similar intersecting vaults should be used to cover the main roof, in order to admit windows raised to light the vaulting. But how was this to be managed with the small materials at command? If the transverse arches AB, CD (fig. 3) are semicircular, and the side-arches AC, BD the same—the vault being formed by two intersecting cylinders—then the intersecting groins AD and CB must be elliptical. This was a difficult form of construction: the medieval builders found it easier to construct semicircular groin arches with radius EA (fig. 4), and to fill in the triangular spaces ABE, &c., with slightly domed vaults. Here, then, we have the origin of the groin-rib, the development of which played so important a part in Gothic vaulting. When the space to be covered was square, this form of vault was found to answer, and usually included two bays of the side-aisles. But this arrangement looked awkward externally, the windows of the clerestory not grouping well with those of the side-aisles. A transverse arch (a, a, fig. 4) was then introduced, carrying up the design from the nave piers to the vaulting. This form of vault is called hexapartite. All the above forms of vaulting were fully developed in the round arched styles of the Rhine.

In France, these forms were also tried; but it was found that the semicircle is not a good form of arch unless loaded on the haunches, many of the churches which were vaulted in this manner during the 11th c. having to be buttressed or rebuilt in the 12th and 13th centuries. In the south of France (where the Byzantine influence had been strongly
felt, through the Mediterranean commerce), the pointed tunnel-vault (fig. 5) had been long in use, and had superseded the semicircular tunnel-vault probably as early as the 9th or 10th century. This form of arch was thus probably suggested to the architects of the north of France, who at once saw how it would overcome the difficulty of the yielding of the haunches in the semicircular arch. They were thus led to the adoption of the pointed form for their transverse arches as a structural expedient, and still retained the semicircular form in the groins. The next question which engaged attention, and the solution of which led to the further use of the pointed arch, was the vaulting of oblong spaces. This had been tried with semicircular arches, but it was found that in this way the vault would require to be very much domed—the diameter of the arches (c, c, fig. 2) being so much smaller than that of a—a—whereas by using pointed arches, of different radii, for the transverse and side arches all might be kept to about the same height (figs. 6 and 7). This is more

usually.

from the further use of the pointed arch, was the vaulting of oblong spaces. This had been tried with semicircular arches, but it was found that in this way the vault would require to be very much domed—the diameter of the arches (c, c, fig. 2) being so much smaller than that of a—a—whereas by using pointed arches, of different radii, for the transverse and side arches all might be kept to about the same height (figs. 6 and 7). This is more

fully explained by fig. 6. If AB be the diameter of the transverse arch (aa), and AC that of the side arch (cc), it is clear that the semicircular side arch ABC cannot reach the height of the transverse arch AEB, even when stilted as at D'. But in the pointed arch, CEB, the same diameter rises to very nearly the height of the transverse arch. The pointed arches AUB and AUC (fig. 7) show how easily arches of this form, whatever their diameter, can be built of the same height. By the introduction of this new form of arch the vaulting was strengthened, and the thrust brought to bear steadily on single points. We have then traced the history of vaulting from the time of the Romans to the 12th c., when the principles of Gothic pointed vaulting were fully developed; and we have dwelt particularly on this subject, because it includes the principles which regulated the whole of the Gothic style. Gothio was not the invention of an individual, but a necessary growth—a gradual development from structural requirement. This is clearly the case with regard to the vaulting, as we have traced it above, and the same might be proved regarding every member of the style. Thus it might be shown how the ribs became gradually more decided, expressing the part they bore in the support of the roof; how the Nave Piers (q.v.) were gradually subdivided into parts, each shaft bearing on a separate cap a separate portion of the vaulting; how the buttresses were developed as they were required to resist the thrust of the ribs: how, concentrated on points, and how the flying buttresses were forced upon the Gothic architects much against their will, as a mode of supporting the arches of the roof.

The history of the latter is very curious. The thrust of the tunnel-vault was sometimes resisted by half tunnel-vaults over the side-aisles (see fig. 5). These, therefore, required to be high, and a gallery was usually introduced. In the Narthex at Vergigny (fig. 3) we have this gallery with the vaulting used as a counterpoise to that of the nave. This is a fine example of vaulting in the transition transverse arches, and to strengthen these, flying buttresses are introduced, which timidly shew themselves above the roof. The galleries were, in later examples, dispensed with to admit of larger clerestory windows, and the flying-buttresses were left standing free. The architects finding them indispensable, then turned their attention to render them ornamental. Pinnacles may also be shown as bows to their origin to use; they acted as weights to steady the buttresses and piers. We shall, under their separate heads, point out how each element of Gothic architecture was in the strictest sense constructional, the decoration being in harmony with its actual use, or as Pugin has said, 'decorated construction not constructed decoration.'

The full development of Gothic vaulting, which was the forerunner of the whole style, was first carried out in the royal domain in France about the middle of the 12th century. The Normans had settled in the north of France more than a century before this, and had applied their talents and the fruit of their conquests to the building of splendid temples in honour of their victories. In doing so, they found out the round-arched style, and brought it forward by a great stride towards true Gothic. See Norman architecture.

South of the royal domain, in Burgundy, there had existed for centuries great establishments of monks, famous for their architecture. The Abbey of Cluny was their central seat, whence they sent out colonies, and built abbeys after the model of the parent one. The style in which they worked was also an advanced Romanesque, but different from that of the Normans.

Between these two provinces lay the royal domain. Owing to the weak state of the kingdom, architecture had hitherto made little progress in the Isle of France. About the beginning of the 12th c. the monarchy revived, and for the next two centuries was governed by wise and powerful monarchs, who succeeded in re-establishing the royal supremacy. A new impulse was thus given to the literature and arts of the country, by which architecture profited largely. From the state of ruin into which the kingdom had fallen, there were almost no churches existing worthy of the new state of things. New and great designs were formed: histepio, almost all the important churches of France were abbey churches; now, under the royal patronage, cathedras

state, the vaulting of the gallery resists the main vault, as in fig. 5, and is at the same time groined. This leaves rather a weak point opposite the

Fig. 6.

Fig. 7.

![Fig. 6](image-url1)

![Fig. 7](image-url2)
were to be built. The bishops, envious of the power of the monks, lent their powerful aid, and the whole of the laity joined heartily in the work. With such a universal impulse, no wonder that architecture took a great stride, and new forms were introduced. It is to this period and people that we owe the development of the true or pointed Gothic style. We have already seen at Vezelay how nearly the Burgundian monks had approached to Gothic. To complete the development, it only required the side-walls and vaulting of the nave to be raised, so as to admit of windows over the roofs of the side-galleries; and the flying buttresses to be raised with them, so as to receive the thrust of the vault—the latter being constructed with pointed groin ribs, and the side and transverse arches carried to the height of the groins. The laic architects of the royal domain soon accomplished this step, and the new style sprang up and progressed with the most astonishing rapidity. The earliest example we have of the fully developed Gothic style is the Cathedral of St. Denis, in which are deposited the remains of the kings of France. It was founded by the Abbé Suger in 1144. The Cathedral of Notre Dame of Paris soon followed, and almost contemporary with it arose the magnificent cathedrals of Chartres, Rheims, Amiens, Beauvais, Bourges, and a host of others. Another cause which tended much to hasten the progress of the style, was the invention about the same time of painted glass. The Romanesque architects had been in the habit of decorating their churches with frescoes and other paintings; but this new mode of introducing the most brilliant colours into their designs was at once seized upon by the northern architects. The small circular-arched windows, which were still in many instances retained long after the pointed-arch had become usual in the vaulting, no longer sufficed to light the churches when filled with stained glass. They were therefore enlarged, two or even three were thrown into one, divided only by mullions; this compound window was again increased until the compartment of the clerestory became almost wholly for more and more space for stained glass was the origin of the window-tracery, which forms so beautiful a feature of the style. It is the last attenuated remains of the wall space of the clerestory, which was at last entirely absorbed. Fig. 9, from Notre Dame, is a good illustration of the progress of French Gothic. The left-hand portion of the elevation shows the mode of fenestration adopted. The clerestory windows are small; and, in order to give more light, the vault of the gallery next the window is kept very high. This was the original design; but during the construction of the cathedral, the importance of stained glass had become so great, that the design was altered to give larger windows for its display, as shown on the right-hand portion of the elevation. These windows also show the simple early forms of tracery; that in the aisle windows being later and more advanced. Fig. 10 shows two bays from Tournay Cathedral, and is a good specimen of the mode in which the whole space of the side-walls was made available for window tracery and stained glass. The further history of Gothic architecture in France is simply the following out, to their furthest limits, of the principles above indicated, on which the early architects had unconsciously been working when they originated the style. So long
as the Gothic architects worked on these principles, they advanced and improved their architecture. When, however, the style had become fully developed and matured (about 1300 A.D.), the spirit of progress died. No new features were developed. The architects seemed to think that in its main elements their style was complete, and contented themselves with continuing the traditional style of their forerunners, pushing to their extremest limits the principles handed down to them. Thus, the height of the cathedrals was extended till, at Beauvais, it exceeded the power of the architects to prop up the vaulting. The system of buttresses and pinacles was developed with the utmost skill, till at last the original simplicity and repose of the designs were lost, and the exteriors presented an elaborate system of scaffolding and propping-up in stone. The beautiful forms of the early tracery became distorted into all manner of flowing curves, graceful but unmeaning, of the Flamboyant period (q.v.); and, in short, the art became lost in mere cleverness of design and dexterity of execution, and the architect’s place was usurped by the freemason.

It is in the cathedrals of the 12th and 13th centuries, above referred to, that we find the noblest development of the Gothic style. Everything tended to make them so. The nation was united in the effort—all the science, all the arts, all the learning of the times were centred in the church. In it, and that almost exclusively, the sculptor, the painter, the historian, the moralist, and the divine, all found scope for the expression of their ideas on the sculptured walls, niches, and niches, or the painted windows of the cathedrals—the churches of the people.

The progress of this style in other countries is no less remarkable. At no time in the world’s history did any style of architecture ever spread so wide, or give rise, in so short a time, to so many splendid buildings. No sooner had the style been invented in the central provinces of France, than it immediately spread over the whole of the west of Europe, superseding all other styles, and producing similar splendid buildings wherever it went.

We will note shortly a few of the peculiarities of the style in England, Germany, and Italy. It spread also over the south of France and Spain; but the latter countries have not yet been fully illustrated.

English Gothic. The Normans introduced their round-arched style at the Conquest in 1066, and there are some fine specimens of this style both in England and Scotland—St. Cross, Hampshire; Durham Cathedral; Kelso and Jedburgh Abbeys, &c. But these buildings are not copies of those of Normandy. The English have always, in adopting styles, given them a national impress. As it was with the Norman, so it was to a still greater degree with the pointed Gothic. This was introduced into England about 1174, by William of Sens, who superintended the rebuilding of Canterbury Cathedral. The English architects soon began to follow out a pointed style of their own. They borrowed much from France, and worked it out in their own way, early forming what is now called the Early English style. The differences between the early Gothic of France and England extend to almost every detail. The mouldings, bases, caps, pinacles, buttresses, and foliage of the latter are all impressed with the early English feeling. In France, the feeling of the early Gothic is one of unrest—a constant struggle forward. In England, the effort for progress is not so marked—that of carefulness and completeness prevails. In the plans of the cathedrals the differences are marked (see figs. 11, 12), as the

![Fig. 12—Amiens Cathedral.](https://via.placeholder.com/150)

accompanying plans of the Cathedrals of Salisbury and Amiens shew. The termination of a French cathedral or church is invariably circular ended or special—a form derived from the circular tomb-chest or baptistery, which in early Christian times was built separately, and afterwards taken into the cathedral. The English cathedral, on the contrary, is almost always square ended. The French transepts have almost no projection; the English ones have great projections—Salisbury and Canterbury having two transepts. The French cathedrals are short and very lofty; the English, long and comparatively low. The French buildings are perhaps the grandest and most aspiring, the English the most finished and picturesque.

The exterior of the chevet was a difficulty with the French and Germans, and, as at Beauvais and Cologne, resembles an intricate and confused mass of scaffolding. This difficulty was avoided by the English square ends, which afforded scope for the very English arrangement of the ‘Five Sisters’ at York, or for a large field of stained glass in a single window.

The western portals of the French cathedrals, such as Rheims and Amiens, are among the boldest and most magnificent features of their architecture. In these the English were not far behind, as the western portals of Peterborough and York shew.

The outline of the English cathedrals are usually
and architecture like columns and vaulting, which form so fine a feature of English Gothic (see Vaulting, Fan-TRACERY). In England the style lasted longer than on the continent.

The Germans were nearly a century in adopting the pointed style after its invention in France; and when it was introduced, it retained the appearance of a foreign importation. It never was so completely naturalised as in England. The so-called beauties of the German Gothic are, for the most part, to be regarded rather as excellent specimens of masonry than as artistic developments of the style. The open-work spires, for example, are fine pieces of construction, and have a striking effect; but from the first there is a tendency to commit the work to masons, who rejoice in displaying their manual dexterity. The later Gothic in Germany is the most splendid development of the stone-cutter's art and the draughtsman's ingenuity; these run riot, while the artist is entirely wanting. The distortions of fig. 13 may serve as an example.

The Gothic style forced its way also into classic Italy, but there it was never understood, nor practised in its true spirit. It was evidently an imitation from the beginning. The Italian architects tried to vie with those of the north in the size of their buildings, some of which, as San Petronio at Bologna, and Milan Cathedral, are enormous. The former illustrates the defects of Italian Gothic. The arches are very wide, and there are few piers. There is therefore a bare and naked effect, which is not compensated for by any richness of sculpture or colour. There is a want of scale about Italian Gothic buildings, as there is about those of Italian classic architecture, both ancient and modern. Size alone is depended on for producing grandeur of effect. There is no attempt made to mark the size, and give a scale by which to judge of the dimensions of the buildings in those styles. A large classic temple is simply a small one magnified. In true Gothic architecture the case is different. Not only are the general dimensions magnified in a large edifice, but also the parts are multiplied. The columns and shafts remain of the same size, but their number is increased. The arches are enlarged in proportion to the general dimensions, but the caps, bases, and mouldings remain of the same size as in a smaller building, and thus indicate the greater size of the arch. A true Gothic building of large dimensions thus tells its own greatness, but in a classic or Italian Gothic edifice the size has to be found out. Stained glass was little used in Italy. It may have been intended to decorate the walls with frescoes—as indeed is the case in a few examples. The Church of St. Francis, at Assisi, is the most remarkable building of this kind, and is a most interesting example of fresco-decoration.

The towns of Italy, being early enfranchised, have many municipal buildings in the Gothic style. These will be treated along with those of Belgium hereafter. See Municipal ARCHITECTURE.

We might, in the same manner, trace the Gothic style in all the other countries of Western Europe, but its history is similar in all. It is in England and France that the true spirit of the style was most felt, and the finest examples remain. One space has not permitted us to enter minutely into the various styles of Gothic in each country. The more important of these will be treated separately. See Early English, DECORATED, PERPENDICULAR, Flamboyant.

We may, however, state generally, that both in France and England the style had a complete existence—it was born, arrived at maturity, and died. When the spirit of the early architects had pushed the design to its utmost limits, they rested from their labours, well satisfied with their splendid achievements. Their successors occupied themselves with forms and details, and with the perfecting of every minute part. The art finally passed away, and left architecture in the hands of trade corporations—masons, carpenters, plumbers, &c.—who monopolised the whole work, and acted independently to the exclusion of one directing mind. The result was as we have seen: architecture became masonic skill, and Gothic was finally superseded by the revival of classic architecture in the 16th century.

GOTHLAND (Swed. Gotland), an island in the Baltic, lying between 57° 36' N. lat., and 18° 19' 20' W. long., which, with Faroe, Gotska, Sandö, and other smaller islands, constitutes the Swedish land or province of Gotland and Wisby. Pop. nearly 50,000; and the superficial area about 1200 square miles. Chief town, Wisby (q.v.). G. consists mainly of terracce-like slopes of limestone formation, encircled by cliffs which are broken by numerous deep harbs, more especially on the west coasts of the island, the eastern parts of which are flat. The surface is in many parts hilly and well wooded, but the soil is frantically cultivated. The climate is sufficiently mild to allow of the grape and mulberry ripening in favourable situations in the open air. The land is divided among many small proprietors, who live in separate and detached homesteads. The island of G. was for ten years (from 1439 to 1449) the self-elected place of banishment of King Eric X., who, after long-continued dissensions with his Swedish and Danish subjects, retired to Wisby, where he shut himself up in the castle with his favourite mistress and a band of followers. Having refused to resume his duties, he was declared to have forfeited the crown of Sweden and Denmark, and thereupon he submitted by placing the ships and inesting the coasts of the lands he had formerly governed. The remains of numerous churches and monasteries in every part of the island, but more especially in and around Wisby, attest its former wealth, and afford many noble specimens of the Gothic architecture of the 11th and 12th centuries. The chief exports of G. are wood, sandstone, marble, lime, and leather.

GOTHS (Lat. Gothi, Gothones, Gottones, Gutes, &c.; Gr. Gothoi, Gotto, Gonti oj, Gontones; Gothic, Gotthuuds), the name of a powerful nation of
antiquity, belonging to the Germanic race. By some writers they are thought to have had a Scandinavian origin, which was the belief of their own historian, Jornandes. Indeed, Jornandes, Procopius, Capitolinus, and Trebellius Pollio identified them utterly with the Gete, a branch of the Thracian group of nations; but later researches, especially those of Dr Latham, leave it almost without a doubt that the G. were originally Germans. The earliest notice we have of them is in connection with an event of antiquity, the ravaging of the west. This fact is that of Pytheas of Marseille, who lived about the time of Alexander the Great, and wrote a book of travels, some fragments of which have been preserved in the works of other writers. In one of these fragments, we find mention made of a tribe of Gothones bordering upon the Germans, and who lived round a gulf of the sea called Mentonomon, a day's sail from the island of Abas, where they used to gather amber, and sell it to the neighbouring Teutoni. This gulf, there is every reason to believe, was the Friesche Hof, situated on the Prussian shore of the Baltic. The next notice that occurs of the G. is in the Germania of Tacitus, in which he called the Goths a ferocious and abominable race, as dwelling beyond the Lygii; in the same direction, that is, as the one point out by Pytheas, though not on the sea-coast. Tacitus also distinguishes them as still distinct, from the Goths of the east, that is, the Quadri and Marcomanni, and who are represented by him as using the Gallic tongue. The Gothones, according to this historian, were under regal government, and on that account not quite so free as the other tribes of Germany, but still they enjoyed a considerable amount of liberty. The tribes next beyond them, and dwelling immediately on the sea-coast, were the Rugi and Lemovii, whose form of government was also monarchical, and whose wealth was that of the Gothones, round shield and short sword.

We next hear of the G. as settled on the coast of the Black Sea, about the mouth of the Danube, early in the 3d century. But at what time, or under what circumstances, their migration from the Baltic to the Euxine took place, it is impossible to ascertain. 'Either a pestilence or a famine,' says Gibbon, 'a victory or a defeat, an oracle of the gods or the eloquence of a daring leader, were sufficient to impel the Gothic arms on the milder climate of the south.' In their new home, which was also the country of the Gete (whence, perhaps, the error that confounded them with the Goths), the G. were, both in numbers and strength, so that, as early as the reign of Alexander Severus (222—235 A.D.), they made some formidable inroads upon the Roman province of Dacia. In the reign of Philip (244—249 A.D.), they ravaged that province, and even advanced to the siege of Marcianopolis in Mecia Secunda. The inhabitants ransomed their lives and property by a large sum of money, and the invaders withdrew for a time to their own country. Under Decius, however, they again entered Mecia to the number of about 70,000, led by a king named Coiva. Decius himself advanced to meet them, and found them engaged before Nicopolis. On his approach, they raised the works of their intrenchment, and withdrew to the city of Thrace, near the foot of Mount Haemus. Decius pursued them by forced marches; but at a convenient opportunity, the G. turned with unexampled celerity, and in which they the Bican legion and utterly defeated them. Philippopolis next fell before them by storm, after a long resistance, during which, and the massacre that followed, 160,000 of its inhabitants are reported to have been slain. This was in 250 A.D., when the Visigoths and Ostrogoths were in a terrible and warlike state. Before tracing either of these, however, it should
be mentioned that the G., for the most part, became converted to Christianity about the middle of the 4th c., adopting the Arian form of belief, in accordance with the instructions of their renowned teacher and apostle, Bishop Utilias. Here, also, it may be stated that the term Messo-Goths was applied to certain of the Western G., who, having settled in Moesia, there devoted themselves to agricultural pursuits, under the protection of the Roman emperors.

Visigoths.—Up on the death of Theodosius the Great (395), Zeno, the emperor, wrote to Alaric, king of the Visigoths, seeking the command of the armies of the eastern empire, and upon being refused, he extended the sway of his empire. About 400, he invaded Italy, took and pillaged Rome (410), and was preparing to carry his arms into Sicily and Africa, when his career was arrested by death. See ALARIC. Alaric was succeeded by his son Theudic (414—415), who, having married Placidia, the sister of Honorius, withdrew from Italy into the south of Gaul, and about 412 crossed the Pyrenees into Spain. Athanaric was assassinated at Barcelona, and his successor, Theodoric (415—418), was killed in battle on the confines of the G. now fell on Wallia (415—418), who, extended his power over a great part of Southern Gaul and Spain, and made Toulouse his capital. The G. under this monarch, greatly assisted the Romans in their contests with the Vandals and the Alans. Wallia was succeeded by Theodoric I. (418—451), son of the great Alaric. He lost his life in the bloody engagement of Chalons-sur-Marne, leaving the throne to his son Theodoric II. (452—466), who, however, was assassinated by his brother Theodoric III. (466—483), whose reign was unusually brilliant and successful. The Visigoths were divided into three distinct nations, Visigothic tribes, in France and Spain, introduced the arts of civilization among his subjects, and drew up for their use a code of laws, in which were embodied many sound principles of jurisprudence. Under his successors, Alaric II. (483—506) and Amalaric (506—511), however, the kingdom of the Visigoths declined before that of the Franks. The former fell by the hand of Clovis in battle at Tolbiac in 507, and the latter was killed either in battle or by the hand of his son in the year 531. Under his successor Theudes, the rule of the Visigoths was confined exclusively to Spain. Theudes was in his turn assassinated in his palace at Barcelona in the year 548. It will not be necessary to trace the long line of Visigothic kings that subsequently ruled in Spain from this period down to the year 711. The Visigothic power was completely broken, and their last king, Roderic or Roderick, slain by the Saracens, invaders on the Battle-field of Yalea de la Frontiera.

Ostrogoths.—At the time when the Visigoths were admitted by Valens within the boundaries of the Roman empire, the same favour was solicited by the Ostrogoths, but was refused them by that emperor. They revenged themselves for this slight or injury by making frequent incursions into the Roman territories, sometimes on their own account, and sometimes as the allies of the Visigoths. In 401, the Ostrogoths defeated under their king or general, Athisaus, in attempting to cross the Danube, when many thousands of them perished, either by the sword of the Romans, or in the waves of the river. After this, they obtained a settlement in Phrygia and Lydia, but were ever ready to aid any fresh band of barbarians that prepared to assault the empire. Thus, they joined Attila in his renowned expedition against Gaul (450—453), and fell by thousands under the swords of their kinsmen the Visigoths at the battle of Chalons-sur-Marne. After this, they obtained a settlement in Pannonia, whence they pressed upon the eastern empire with such effect, that the sovereigns of Constantinople were glad to purchase their forbearance by large presents of money. In 475, Theodoric, the greatest of the Ostrogoth sovereigns, succeeded to the throne upon the death of his father Theodoric. He directed his arms almost immediately against the empire of the Hunn, and having gained considerable advantages over him, obtained a grant of some of the richest provinces in the empire. Eventually, he was named the chief of the Hunnish tribes. In 488, with the consent and advice of Zeno, he planned an immense expedition against Odoscan, king of Italy, who had held that title since 476, when he defeated Augustulus, the last of the western emperors. Theodoric utterly defeated Odoscan, slew him, it is said, with his own hand, and reigned undisputed sovereign of Italy until his death in 526. The seat of his empire was at Ravenna, which he sometimes exchanged for Toulouse, and at times, though it was only a city, when he convened a meeting of the senate, and declared that it was his intention to rule the people committed to his charge with even-handed justice. To a great extent, he fulfilled this promise, and governed his subjects with justice and order to their advantage. The glory of his reign was, however, sullied by the execution of two of the most distinguished men of that age, Boethius and Symmachus, upon a charge of having engaged in a conspiracy against him. During his reign, the Ostrogoth kingdom included, besides Italy, all the adjoining countries within the Rhone and the Danube; also the modern Bosnia, Servia, Transylvania, and Albania, and was greatly extended by the conquests of the Ostrogoths, and by the death of his successor's successor, Ostrogoth, named by the emperor. In 536, Belisarius entered Rome, which he held for his master, although invited by the G. to become himself his king; but all his and his successor's efforts to subdue the G. were at that time utterly fruitless. Totila (541—552) was a noted chief of the Ostrogoths, his successor to Vitiges, the antagonist of Belisarius, but was conquered in the battle of Tagina, by the imperial general, Narses, in the year 552. In that battle, Totila received his death-wound, and was succeeded by Teias, who did all that a brave man could to repair the misfortunes of his countrymen. It was to no effect, however, for he also was killed in battle in the following year, when 'his head,' says Gibbon, 'exalted on a spear, proclaimed to the nations that the Gothic kingdom was no more.' The Ostrogoths, broken and dispersed by their calamities, henceforward disappear from history as a distinct nation, their throne in Italy being filled by the exarchs of Ravenna; while the nation generally became absorbed in the indiscriminate mass of Alani, Huns, Vandals, Burgundians, and Franks, who had from time to time established themselves in the dominions of the old Roman empire.

GOTLAND (GOTLAND, or GÖTARIKE), the most southern of the three old provinces or main divisions of Sweden (q. v.). G. is now divided into 12 lans or departments; it has a superficial area of about 37,000 square miles, or one-fifth that of all Sweden, and a population of 2,292,306. The greater part of the region, more especially in the north and in the interior, is covered with mountains,
forests, and lakes, but its southern districts contain some of the most fertile land in Sweden. The principal lakes are the Wener (q. v.) and the Wetter (q. v.). The river Gota, which was unfit for navigation on account of its cataracts, the most picturesque of which is that of Tullhätten, has been rendered navigable by the construction of numerous locks and canals, and it is now open to vessels of considerable burden from Gottenburg, on the Cattegat, to Lake Wener, from whence the Gota Canal extends the line (of 286 miles) of internal communication across the kingdom to its eastern shores. G. comprehends a large portion of the mining districts, and is especially rich in iron and alum, and yields good copper, nickel, coal, &c. The peasantry are superstitious, attached to their old traditional usages and their national costume, but are honest and industrious, hospitable and contented.

GOTENBURG (Swed. Göteborg), next to Stockholm, the most important city of Sweden, in lat. 57° 41' N., long. 11° 58' E., and the principal town of the land of Gotenborg. Its population, in 1858, was 322,173, exclusive of its extensive environs. G., which was founded by Gustavus Adolphus in 1618, is situated on the river Göta, a few miles from the Cattegat, and consists of a lower town; the two latter are connected by numerous canals, which are bordered by allees of fine trees, and spanned by numerous bridges; and the latter picturesquely scattered over the adjacent rocky heights. Its admirable harbour, which is protected by the forts, affords safe anchorage to ships of heavy burden, and has long been noted for its extensive foreign commerce. The upper parts of the town have wide and regular streets and good stone houses, but there are few buildings deserving of special notice excepting the new church, the Exchange, the Cathedral, the Townhall, and Arsenal. G. is the see of a bishop, and the seat of the government of the district. It has good schools, one of them founded by Oscar L., the late king, for the children of soldiers; a public library; and an academy of science and literature, which was incorporated in 1775; besides various educational, literary, and benevolent institutions of modern date. The bridges of the Göta Canal, which connects the German Ocean and the Baltic, has exerted a very important influence on the commercial relations of G., by bringing it into direct communication with Stockholm and a great portion of the northern continent. The town of Göteborg, lying in a flat belt of land between the Cattegat and the Göta, has a population of about 20,000, and contains 366,000 vols. and 3000 manuscripts; the observatory; the art museum, with collections of old oil-paintings, of engravings, of coins and models of all sorts, and some casts from the antique; the lying-in-hospital, the chemical laboratory, and the botanic gardens (laid out under Haller's superintendence in 1739), one of the chief ornaments of the town. From 1822 to 1826, the number of students attending the university of G. averaged 1481 annually; but in consequence of the troubles of the period, the number in 1834 had fallen to 860. The university could, however, still boast a rare assemblage of distinguished teachers, such as Blumenbach, Dahlmann, Ewald, Gauss, Gervinus, Gieseler, Herbert, Lücke, Ofr. Müller, the brothers Schlegel, G. Grimm, and Dr. D. G. Grimm, which in 1834 consisted of seven professors, Albrecht, Dahlmann, Ewald, Gervinus, the two Grims, and W. Weber, for political reasons, inflicted a blow upon the university from which it has never recovered. In 1835, it had 107 professors and 713 students, of whom 125 pursued theology, 231 law, 201 medicine, and 156 philosophy; besides 337 students from foreign countries. The chief manufacturers of the town are hosiery, leather, and musical and scientific instruments, but the only flourishing trade of G. consists in the sale of tobacco and tobacco-pipes, books, and sausages. Pop. 11,228.

GOTTFRIED VON STRASBURG, or GODFREY OF STRASBURG, so called, it is believed, either from having been born, or from having resided in the town of Strasbourg in Alsace, was one of the most eminent poets or minnesingers of the Middle High German period. He flourished during the latter half of the 12th century. His chief work, Tristan, in the composition of which he was employed at his death, and which extends to about 20,000 stanzas, was published by Hartmann von Aue in 1297, and is said to have been written by Hartmann of Aue, whom he celebrates as the first of German narrators, and after the publication of the first portion of Wolfram von Eschenbach's Paretal, to the prologue to which he alludes. Ehlert of Oberg had worked up the story of Tristan from a French poem. G. founds his story on another French poem (of which considerable fragments are still extant), and names as the author Thomas of Brittau, who, however, is not to be confounded with the half or wholly fabulous Thomas of Erquile, referred to in the old French story of Tristan, published by Sir Walter Scott. Besides Tristan, some lyric poems by G. are still extant. G.'s works, with Clerc von Fürhheim's and Heinrich von Freiberg's continuations of Tristan, were published by Fr. H. von der Hagen (Breslau, 1823). An edition worthy of the poet is still a desideratum. A translation of Tristan into modern German with an original conclusion, has been published by H. Kurz (Stuttgart, 1844).

GOTTINGEN, a town in the kingdom of Hanover, in lat. 51° 31' N., long. 9° 56' E., and one of the pleasantest in the whole of Lower Germany, is situated in a fruitful valley on both banks of an artificial watercourse, the Leine, called the New Leine, about 60 miles south of Hanover. It is in general well built, but is almost destitute of fine edifices, and has an air of solitude, which even the number of students cannot dissipate. The town consists of two districts, Innenstadt and Rathaushaus, comprehends 417 acres of land, and contains the educational institutions, of which there are many; the hospital, and the university, are the only buildings of any note. The university, instituted by George II., king of England, and Elector of Hanover, in 1734, and opened 17th September 1737, is regarded as the great national school of Brunswick, Mecklenburg, and Nassau, as well as of Hanover. Connected with it are the library, the museum, the schools of medicine, law, and theology; the college of arts; the academies of science and literature, of music, and of fine arts; the royal gardens and national park; the art gallery; the observatory; and the botanic garden (founded by Haller 1739). The university could, however, still boast a rare assemblage of distinguished teachers, such as Blumenbach, Dahlmann, Ewald, Gauss, Gervinus, Gieseler, Herbert, Lücke, Ofr. Müller, the brothers Schlegel, G. Grimm, and Dr. D. G. Grimm, which in 1834 consisted of seven professors, Albrecht, Dahlmann, Ewald, Gervinus, the two Grims, and W. Weber, for political reasons, inflicted a blow upon the university from which it has never recovered. In 1835, it had 107 professors and 713 students, of whom 125 pursued theology, 231 law, 201 medicine, and 156 philosophy; besides 337 students from foreign countries. The chief manufacturers of the town are hosiery, leather, and musical and scientific instruments, but the only flourishing trade of G. consists in the sale of tobacco and tobacco-pipes, books, and sausages. Pop. 11,228.

GOTTSCHED, Johann Christoph, a once popular German writer, was born at Juditenkirch, near Königberg, in Prussia, February 2, 1706, and at the age of 14 entered the university of Königsberg with the intention of studying for the church, but he soon turned his attention to philosophy, the fine arts, and languages. In 1724, he removed to Leipzig, where in 1730 he became extraordinary professor, and in 1731 professor of logic and metaphysics. He died 12th December 1766. G.'s great merit lay in his endeavouring to make the German language the...
vehicle of instruction for his countrymen in literature and science, as well as in arts, and has essentially a technically French; and his clear, calm, and 'correct' understanding naturally led him to admire writers like Racine and Boileau, and to value elegance, precision, and purity of style more highly than all other qualities. G. executed a multitude of poems, critical and philosophical works, translations, &c. His tragedy, Der Sterbende Cato ("The Dying Cato"), which, in the days of its popularity, went through not less than ten editions, is now regarded by his contemporaries as a frightful specimen of 'correct' and watery verse.

GOUDA (Dutch, Ter Gouwe), a town of Holland, in the province of South Holland, is situated on the right bank of the Yssel, at the junction of the Gouwe with that river, 11 miles north-east of Rotterdam. It has the largest market-place in Holland, consisting of a spacious square, which contains the town-house and the church of St John. The latter building has 31 magnificent stained glass windows, most of them 30 feet high, and two of them nearly twice that height. These windows were executed between 1560 and 1603 by the brothers Graebisch, and are among the finest in Europe. G. is said to have had, in 1531, 374 clay-pipe works; it has now only 1. The clay used in this manufacture is brought from Coblenz and Nauir. It has also numerous potteries, extensive brick and tile works; the bricks are called Chinkers, or Dutch chinkers, and are much used in building. G. also manufactures cotton, woollen, and sail cloths, has rope-walks, gin-distilleries, breweries, and a famous cheese-market, at which G. cheese, made from new milk, and esteemed the best in Holland, is extensively sold. Pop. 14,923.

GOUKAYA, GOTA, or SEVANG, LAKE OF, a deep inland lake of Russian Armenia, in lat. 40° 8'-40° 35' N., and long. 44° 45'-45° 35' E., 30 miles north-east of the town of Erivan. It is 47 miles in length from north-west to south-east, is 15 miles in average breadth, and is situated in a mountainous district at an elevation of 5,300 feet above sea-level. The principal facts known about this lake are, that it is very deep, and yields good fish; that its banks abound in volcanic products; and that, without having any considerable outlet, it receives comparatively little water, so that thousands of tons of salt in the southernmost part is annually carried away by the annual wind. The lake is famous for its sheltered fishing grounds, and is visited by considerable numbers of hunters and sportsmen.

GOURA (Lupinus coronatus or Columnea coronata), by far the largest of the pigeon family (Columbidae), a native of Java, New Guinea, and other islands of the Indian Archipelago. It is two feet four inches in length from the tip of the bill to the extremity of the tail. It is a very beautiful bird, of a greyish-blue colour, parts of the back and wings black and purplish-brown, a broad white bar across the wings. The head is adorned with a large semicircular crest of narrow straight silky feathers, always carried erect: The (g.) is in the highest esteem for the table, and might probably be domesticated with great advantage in tropical countries; but attempts which have been made to introduce it into the poultry yards of Holland have completely failed, owing to the climate.

GOURD (Cucurbita), a genus of plants of the cucurbit family, nearly allied to the cucumber; having male and female flowers on the same plant, the flowers large and yellow. The species are annual plants of very rapid growth; their leaves and stems rough; the leaves broad and lobed; the stems often very broad and trailing; natives of warm climates, although the native region of the kinds chiefly cultivated is very uncertain, and they have probably been greatly modified by cultivation; perhaps all of them may be forms of one original species, a native of some of the warmer parts of Asia. The Common G. or Pumpkin (C. pepo), with smooth globose or pear-shaped fruit, varying from the size of a large apple to sixty or seventy pounds in weight, is much cultivated both in gardens and fields in almost all parts of the world of which the climate is warm enough for it; and the fruit is not only a very important article of human food, but is also used along with the imperishable squash for feeding cattle. In many countries, pumpkins are a principal part of the ordinary food of the poorer classes, and are much used even by the wealthy; they are not eaten raw, but dressed in a great variety of ways—as in pies, with apples, sugar, spice, &c., or sliced and fried with oil or butter, or made into soups, &c. Pumpkins are much cultivated in North America. In England, they are also cultivated, but not to a great extent, and never for food for cattle. It is not unusual for English cottagers to plant them on dung-hills, and to train the shoots along the neighbouring grass.—The Vegetable marrow (C. maxima or C. melopepo) appears to be a rather varieties of which was introduced into Europe from Persia since the beginning of the 19th century, but is now more generally cultivated in Britain than any other kind of G., being one of the most hardy, and its fruit of excellent quality and suitable for culinary purposes. It is, however, almost at every stage of its growth. When fully grown, the fruit is elliptic, very smooth, generally about nine inches long and four inches in diameter; but these dimensions are occasionally much exceeded. One of the most valuable genera of this family is that of the Great G. (C. maxima) of which the Spanish G. is a green-fruited variety; and the Great Yellow G., the largest of all, has yellow fruit, with firm flesh of a deep yellow colour. It is sometimes fully 200 lbs. in weight, and eight feet in circumference. The form of the fruit is a somewhat flattened globe; when boiled, it is a very pleasant and wholesome article of food. It is much cultivated in the south and south-west of Germany, where it is known as the Elector's Hat, and the name Turk's Cap is bestowed on another. The Squash is regarded as one of the best gourds, and is much cultivated in some parts of Europe and in North America.—The Winter G. (C. terricola), which has a very hard-skinned fruit covered with large warts, and the Musk G. (C. moschata), distinguished by its musky smell, are less hardy than the kinds already named; as is also the Orange G. (C. aurantia) sometimes cultivated on account of its beautiful orange-like fruit, which, however, although sometimes edible and wholesome, is not unfrequently very unfit for use, on account of eccentric development in it. This is apt to be the case in some degree with other gourds also, but the bitter taste at once reveals the danger. The same remark is applicable to the young shoots and leaves, which, when perfectly free from bitterness, are an excellent substitute for meat when Scotland, even the most hardy gourds are generally reared on a hotbed and planted out. In England, it has been suggested that railway-banks might be made productive of this vegetable by planting them with gourds. Ripe gourds may be kept for a long time in a cool well-ventilated place, nor are they injured by cutting off portions
GOUL.

for use as required. The name G. is often extended to many other \o'clock and islands.

\o'clock (Gr. gouta, from Lat. gatta, a drop), a

medieval term of uncertain date, derived from the

humoral pathalogy (see Rheumatism), indicating a

well-known form of disease, which occurs for

the most part among persons of a less luxurious

habitats, and past the middle period of life. The

acute attack of gout begins most commonly by a

painful swelling of the ball of the great toe or of

the instep, sometimes in the ankle or knee; more

rarely, it attacks both lower limbs at once; and

more rarely still, it seizes first upon some other part of the body, the foot being either not attacked at all, or becoming involved at a later period. In the great majority of cases, the foot is not only the first part attacked, but the principal seat of the disease throughout; according to Scudamore, indeed, this is the order of events in not much less than four-fifths of the cases. In exceptional instances, the ankle, knee, hand, elbow, &c., are attacked at first; now and then, the disease smoulders in the system in the form of disorders of the digestive or nervous functions, or oppression of the circulation for some time before it takes the form of 'regular' gout—that is, of an acute attack, or fit, of gout in the foot. The name polagra (Gr. pod, foot, and agra, seizure) indicates the leading character of this disease as supposed by any antiquity; and the very numerous references to the disorder so called, not only in the medical writings of Hippocrates, Galen, Aretæus, Cædus Aurelianus, and the later Greek physicians, but in such purely fictitious works as those of Lucian and Seneca, Ovid, and Pliny, shew not only the frequency, but the

notoriety of the disease. The allusions, indeed, are of a kind which give ample proof that the essential characters of gout have not been changed by the lapse of centuries; it is caricatured by Lucian in his burlesque of Tragopodagra in language quite applicable to the disease as now observed; while the connection of it with the advance of luxury in Rome is recognised by Seveua (Epist. 85) in the remark that in his day even the women had become gouty, thus setting at naught the authority of physicians, which had asserted the little liability of women to gout. Pliny likewise (book 26, chap. 10) remarks upon the increase of gout, even within his own time, not to go back to that of their fathers and grandfathers; he is of opinion, further, that the disease must have been imported; for if it had been native in Italy, it would surely have had a Latin name. Ovid and Lucian represent gout as mostly incurable by medicine; from this view of it, Pliny disconsolate. The list of quack remedies given by Lucian is one of the most curious relics of antiquity.

In the present day, gout is observed to prevail wherever there is an upper class having abundant means of self-indulgence, and living without regard to the primeval law of humanity, 'in the sweat of thy face shalt thou eat bread.' The directness, however, with which gout can be traced, in particular cases, to its predisposing causes is various; and in many instances, a well-marked hereditary tendency to the disease may be observed, which even a very active and temperate life can scarcely counteract; whereas, in the other hand, the most grave forms of excess may be practised for a whole lifetime without incurring the gouty penalty. It is difficult to explain these variations; but they leave unaffected the general principle, that gout, disease especially of the wealthy, and in most of those who have little physical exertion, and give great scope to the bodily appetites. The prevention and cure, accordingly, have been at all times recognised as being mainly founded on temperance, combined with the cultivation of active and regular habits as to exercise. Many amusing stories are told having this moral, and shewing how gout has been cured by the opportune occurrence of calamities which have created the necessity for labour, and removed the means of self-indulgence. With a few special exceptions, indeed, it may be said that the labouring class, and especially those that labour in the open air, are almost, if not altogether free from this disease. But it is known that it happens with the mind, not being subject either to great privations, or to the restraint of unusually abstemious habits of life, are remarkably subject to gout; the more so if their bodily and mental constitution has been originally robust, and fitted by nature for a degree of activity which the artificial necessities of fashion or of occupation have kept within too narrow limits. Hence, the well-known saying of Sydenham, that gout is almost the only disease of which it can be said that it 'destroys more rich men than poor, more wise men than simple.' And in this manner accordingly (he adds), there have lived and died great kings, princes, generals, admirals, scholars, and others not to mention a few.' Gout is, therefore, the counterpoise in the scales of fortune to many worldly advantages; the poor and needy have it not, but suffer from their own peculiar calamities; the favourites of fortune are exempt from many privations, but this very exemption paves the way for the gout; whereby even in this world Dives suffers as well as Lazarus, and sometimes, it may be, learns the lesson of his suffering. Such is the sense, though not the exact words, in which, nearly two hundred years ago, Sydenham expressed the convictions of a lifetime on this subject.

Sydenham's treatise on gout is interesting not only as containing the well-considered views of a master in the medical art, but also as the faithful description of the disease by one of the victims of it. His account of the paroxysms of regular gout may be given here with some abbreviation. After some weeks of previous indulgence, attended with flatulent swelling and a feeling of weight, rising to a chill in the epigastrium of the thighs, the patient goes to bed free from pain, and having had rather an unsatisfactory and strong appetite the day before. In the middle of the night, or even in the very small hours of the morning, the joint of the affected limb, the great toe, or sometimes in the heel, the ankle, or the calf of the leg. The pain resembles that of a dislocated bone, and is accompanied by a sense as if water not perfectly cold were poured over the affected limb; to this succeeds chilliness, with shivering, and a trace of feverishness, these last symptoms diminishing as the pain increases. From hour to hour, until the next evening, the patient suffers every variety of torture in every separate joint of the affected limb; the pain being of a tearing, or crunching, or gnawing character, the tenderness such that even the weight of the bedclothes, or the shaking of the room from a person's walking about in it, is unbearable. The next night is one of tossing and turning, the uneasy limb being constantly moved about to find a better position; till towards morning the victim feels sudden relief, and falls over into a sleep, from which he wakes refreshed, to find the limb completely cured. This is the most usual present in the early stage having been succeeded by a more general form of swelling, often with itching between the toes, and a peeling-off of the skin around the affected limb. This may be repeated many times, in the course of what is termed 'a fit of the gout,' which commonly extends over a period of weeks, or even months, before the patient is completely relieved; or the attacks may occur in
GOUT.

both limbs, or in several other parts of the body in succession, the real termination of the "tit" being at last indicated by an apparently complete restoration of health, and even, in some cases, by a period of improved condition and capacity for exertion, as compared with the state of the patient before the attack.

Such are the principal features of the "regular gout." In this form, it might almost be called a local attack, like malaria, for the patients have attacks with deranged digestion, or with a variety of other minor ailments too complex to be described here, and the obvious relief obtained through the "tit" from the symptoms of constitutional suffering, point to a cause of the disease other than any of the larger range of functions than those included in the ordinary local manifestations at this period. Regular gout, accordingly, forms only part of a nosological picture, in which the so-called irregular, atomic, metastatic, or retrocedent forms have to be included before it can be said to be at all complete. These, indeed, form almost the darker shadows of the picture; for regular gout, though a very painful disease, only rarely has failed to be dangerous to life, or even to the limb affected, at least until after many attacks.

It is the tendency, however, of gout, when recurring often, to fall into irregular forms, and herein lies the whole secret of the occurrence of the disease. It is, indeed, soon apparent, and it leads rapidly to other evils. The joints which have been repeatedly the seat of the regular paroxysm, become, more or less permanently, crippled and distorted. A white, frail, tender, and inflamed infiltration gradually deposits itself around the cartilages and ligaments, and sometimes in the cellular tissue and under the skin. Sometimes this material is discharged externally by ulceration, and then usually with relief. At other times, it accumulates, and becomes constant, assuming the form chiefly of acidity after meals; the liver becomes tumid, the abdomen corpulent, the bowels disposed to constiveness; the kidneys discharge a vitiated secretion, and not infrequently there is a tendency to gravel and Calculus (q.v.); the heart is affected with palpitations, or fainting fits occur, sometimes with spasmodic attacks of pain; the arteries become the seat of calcareous deposits, and the veins are varicose in the limbs and in the neighbourhood of the lower bowel (see Piles); the temper is singularly irritable, and often morose; then, sooner or later, the appetite fails, or is only kept up by very stimulating and unwholesome diet, with an excess of wine or of alcoholic liquors; in the end, the body emaciates, the energy of all the functions becomes enfeebled, and the patient fails a prey to diarrhoea, or to some slight attack of incidental disease. Sometimes the end is sudden, as by apoplexy or structural disease of the heart; sometimes, on the other hand, it occurs in the midst of one of those violent spasms which have popularly acquired the name of 'gout in the stomach,' the true character of these attacks, however, being by no means well understood.

The sketch here given of the leading external phenomena of gout is very incomplete, as every popular description, to be at all intelligible, must necessarily be. But the reader will not fail to see in it the type of a disease occurring under a number of remarkably varied forms, and lurking in the constitution, at times, under the most strangely anomalous disguise; under one of the more usual aspects of robust or rude health. It has been an object, accordingly, with physicians to trace out the gouty predisposition under the name of a habit of bodily, or divitis, cognisable previously to any of the local manifestations of the disease. They have given the ideas of authorities usually become hazy, and their descriptions corresponding ill defined or contradictory. The anomalous forms of the disease itself are also exceedingly difficult to describe accurately, and must in this case be left out of the present summary of the characters of the more usual aspects of gout, as it presents itself to physician and patient. The causes of the disease have been sufficiently indicated above.

One fact in regard to gout has relation to its intimate chemical and structural pathology, not less than to its outward characters; and forms, in fact, the pathological connection of a great number of its consequences and phenomena. That in all cases of well-marked and highly developed gout have nearly a uniform composition, into which the urine, through which it seems to be habitually expelled from the system. In certain circumstances, uric acid is deposited also in the form of urinary gravel or Calculus (q.v.); and it is this kind of gravel to which the gouty are especially subject, as we have indicated above. A conjunction of facts so striking as these could not but arrest the attention of pathologists; and it is long since Sir Henry Holland and others threw out the hypothesis, that uric acid is the very materia medica of gout, of which ancients and moderns had been so long in search. It would be out of place to enter on the discussion of this subject here; but it must be indicated as a fact of recent discovery, that uric acid in a certain excess has been shown by Dr Garrod to be characteristic of the blood of the gouty, although a minute amount of this substance is probably present even in perfect health. The most recent speculation accordingly, tend to connect the gouty predisposition either with an excessive formation, or a checked excretion, of this important nitrogenous organic acid, the product, as physiology teaches, of the vital disintegration of the flesh and of the food, after these have subserved the daily wants of the system. At this point, the inquiry rests for the present.

The cure of gout, in the highest sense of the word, demands the careful consideration of all its predisposing causes in the individual, and the strict regulation of the whole life and habits accordingly, from the earliest possible period. It is the difficulty of accomplishing this which makes gout a disease proverbially intractable; for the regular attacks of the disease seldom occur till pretty late in life, long after the habits have been fully formed which are most adverse to the cure. Rigid temperance in every form of eating and drinking, with daily exercise, is proportionate to the strength and condition of the individual, in reality constitute the only radical cure of gout, the lesson of ages of experience as read to the gouty by the light of science. But the lesson is not learned, or only learned when too late. It should never be forgotten that a man of gouty family, or individually much exposed to the causes of the disease, can only hope to escape it in his old age by habits of life formed at an early period, and
by a careful avoidance of most of the common dissipations of youth. That the disease may be warded off in this way, there is ample evidence; and it is not less certain that there is no other way of living secure from gout. The treatment of the fit, in so far as it does not resolve itself into the celebrated prescription of ‘patience and flannel,’ must be a subject of medical prescription. The well-known virtues of Colchicum (q.v.) are perhaps somewhat overshadowed by its poisons; and its dangers are not less striking than its virtues. It is certain, however, that in cautious medical hands colchicum is a remedy of great value in the gouty paroxysm; and of equal value perhaps are certain natural mineral waters, as those of Vichy and Carlsbad. Alkalies and their salts, especially potash and lithia waters, as prepared artificially, with minute doses of iodine and bromine, have likewise been much recommended for the cure of gouty deposits. For the distinctions of gout and rheumatism, and the presumed relation between them in some cases, see Rheumatism.

GOUT—WEED, or BISHOP—WEED (Eupogodiun pedunculatus), a perennial umbelliferous plant, with three or four white terminal unequally serrate leaflets, stems from one to three feet high, and compound umbels; now a very common weed in gardens and waste grounds in Britain, although believed to have originally introduced by monks from the continent of Europe, on account of the virtue ascribed to it of allaying the pain of gout and piles. It is a troublesome weed, very difficult of eradication. Its medicinal virtue is now disregarded, as its smell is not agreeable, but its young leaves are used in Sweden in early spring as a pot-herb. Another English name is Herb Gerard.

GOVAN, a thriving village or small town of Scotland, in the county of Lanark, is pleasantly situated two miles west of Glasgow, with which it is connected by an elegant line of villas, on the left bank of the Clyde. The prosperity of Govan is chiefly dependent upon Glasgow, into which indeed it has become almost absorbed. It now contains several ship-building yards, which are carried on by Glasgow firms. There are also at Govan a dye-work and a factory for throwing silk.

In the 16th c., this ancient village was considered one of the largest in Scotland, and even down to the middle of the 17th c., it received the name of ‘Mickle Govan.’

GOVERNMENT, in its political significance, may be considered as including the power by which communities are ruled, and the means by which, and the form and manner in which, this power is exercised. In treating of the subject, we shall first indicate those characteristics that seem essential to the existence of government altogether, and then proceed to mention the various forms which its machinery has assumed, or is capable of assuming. It is of the essence of every government that it shall represent the supreme power or sovereignty of the state, and that it shall thus be capable of subjecting every other will in the community, whether it be that of an individual, or of a body of individuals, to its own. There is and can be no constitutional or fundamental law, not self-imposed, which is binding on a government in this, its highest sense. Whatever be the restraints which humanity, Christianity, or prudence may impose upon governments as on individuals, it is implied in the idea of a government that it should be politically responsible to no human power, at least for its internal arrangements, or in the language of politics, that it should be autonomous. The governments of states which are members of a confederation—as, for example, the states of the American republic, or the Swiss cantons—do not, it is true, possess this independent character. But in so far as they fall short of it, they are deficient in the characteristics of a government in the absolute sense, just as the states are states, not in the highest, but only in a subsidiary sense. The sovereign power with which government is thus armed may be an expression either of the general will of the state, or of the will of a part of the will of a conqueror, and of the army which supports him, as in subject states. In the former case, the power of government over the individual is not altogether, or even in the main, independent of his volition. In the power which government possesses of controlling every other will, is implied the power of protecting every separate will from being needlessly or wrongly controlled by any other will, or number of wills, the will of the government being always excepted. With a view to the exercise of this latter power, government possesses a right, which politically is also unlimited—the right, namely, of inquiry into the relations between every individual citizen. It is in its essence that its scrutiny should be as irresistible as the execution of its decrees. 2. Every government, whatever be its form, seeks the realisation of what we have described as its necessary character, by the exercise of three distinct functions, which are known as its legislative, judicial, and executive functions. The first, or legislative function of government, consists in expressing its sovereign will with reference to a particular matter, irrespective altogether of the effect which it may have on the individuals; the second, or judicial, consists in applying the general rules, thus enunciated, to individual cases in which disputes as to its application have arisen; whilst the third, or executive function, consists in carrying into effect the decisions of the sovereign will, whether these determinations be expressed in the exercise of its legislative or its judicial functions.

In large communities, which are at the same time free—that is to say, in which the general will of the people is sovereign—the performance of the legislative functions of government almost necessarily implies the existence of a general council, parliamentary in character, which it is often capable of exercising, whilst the performance of its judicial functions implies the existence of judges and courts of justice, and of its executive that of a police and an army. But all of these, like the existence of councils of ministers, or servants of the sovereign will—governments in the narrower sense—and the rules by which their appointment, resignation, &c., are regulated, are practical necessities of government in certain circumstances, not theoretical necessities of government in the abstract.

The forms in which communities have sought to realise the idea of government, as thus explained, have been divided, from very early times, into three classes: 1st, monarchy, or that form in which the sovereignty of the state is placed in the hands of a single individual; 2d, aristocracy, or that in which it is confided to a select class, supposed to be possessed of peculiar aptitude for its exercise; and, 3d, democracy, or that in which it is retained by the community itself, and exercised either directly, as in the small republics of ancient Greece, or indirectly, by means of representative institutions, as in the constitutional states of modern times. Each of these forms of political organisation,
GOVERNMENT.

If called into existence by an expression of the general will of the community, maintained by its consent, and employed for its benefit, is said to be a legitimate government (Aristotle, Politic. lib. iii. c. 5)—that is to say, a government which vindicates the interests of the collective body of the people without needlessly encroaching on individual freedom of action. But each of these legitimate forms was said by the ancient publicists (Aristot. of msp. and iii. 4, 7) to have a particular degenerate form, which, when followed, counteracted the very object for which the original form was established: the direction of tyranny, or a government for the exclusive benefit of the one or of the few—oligarchy, aristocracy, or megalocracy—government in which the majority, who were necessarily the rudest and most ignorant portion of the community, exercised a tyranny over the more refined and cultivated few. Through these various forms, in the order in which we have enumerated them, each legitimate form was being followed by its corresponding degenerate or perverted form, government was supposed to run in a perpetual cycle; the last form, ochlocracy, being not far from the first. But all these, which formed a species of interregnum so abhorrent to the social and political instincts of mankind as to induce them speedily to revert to monarchy, at the expense of subjecting themselves to a repetition of the misfortunes which they had already experienced. As a refuge from these evils, the so-called mixed government, or government which should combine the elements of order and permanence of two, at least, if not all, of the three forms of government, whilst rejecting their tendencies to derangement and degeneracy, is supposed to have been devised. A union of aristocracy and democracy was the form in which Aristotle conceived the mixed government, and spoke of it under the title of the politeia. But the tripartite government was not unknown to speculators of even an earlier date. Plato had shadowed it forth in his laws, and Aristotle himself tells us that it had been treated of by other writers (Polit. ii. c. 3). Who these writers really were has been a subject of much speculation, but there is reason to believe that their works contained mere hints of the principle, and the first writer with whom we are acquainted to whose mind it is supposed to have presented itself, was Polybius, who, with Cicero, by whom he was very closely followed in the Republic, holds it to have been realised in the Roman constitution. The most famous example of the mixed government, however, is supposed to be exhibited in that balance of powers which has been so often said to form the essence of the English constitution. But in addition to the fact that these are not separate powers, but only separate organs of the one power or sovereignty which in free states is of necessity centered in the general will (see Constitution), it is extremely doubtful whether any period could be pointed out, either in our own history or in the history of any other nation, in which the sovereignty did not find expression either directly through the one, the few, or the many; or whether such a period, if it did exist, was not a mere period of struggle and transition.

The question as to how far forms of government are a matter of choice on the part of a free people, or are dictated to them by influences which are beyond their volition, has been discussed in a very interesting manner by Mr. Mill in his important work on Representative Government. The conclusion at which he arrives is, that 'men did not wake on a summer morning and find them sprouting up; neither do they resemble trees, which, once planted, are age growing' while men 'are sleeping;' but that 'in every stage of their existence they are made what they are by human voluntary agency (p. 4). This absolute power of human choice, however, is limited by three conditions which Mr. Mill states thus: 'The people for whom the government is intended must be willing to accept it, or at least not so unwilling as to oppose an insurmountable obstacle to its establishment; they must be willing and able to do what is necessary to keep it standing; and they must be willing and able to maintain it, so that it requires of them to enable it to fulfil its purpose. . . . The failure of any of these conditions renders a form of government, whatever favourable promise it may otherwise hold out, unsuitable to the particular case' (p. 5). But there are still more important conditions, not here enumerated by Mr. Mill, but one of which at least is fully recognised in the sequel of his work, which, if not compiled with, renders forms of government unsuitable not only to one case, or stage of social development, but to all cases and all stages of development. These conditions may be broadly stated as falling under a single category viz., that forms of government which are followed by the consequences of being essentially and recognised those arrangements of Providence which are beyond the reach of human control. This condition seems so obvious, that one would suppose it could scarcely be overlooked in fixing on a particular form of government, and yet there is none which has been overlooked more frequently. The most prominent example—to which Mr. Mill and all speculative politicians of note have been drawn to attach much importance of late years—is that in which a form of government is constructed on the assumption that 'all men are equal,' the fact of nature being the very opposite. Such a form of government, being founded on a false assumption, can be made to work only by the direct results of its action being counteracted by indirect means, as has been the case in all the so-called pure democracies that have had any permanent existence. The state in these cases is governed not in accordance with, but in spite of, the form of government.

The famous discussion as to what is absolutely and in itself the best form of government, which has occupied so large a portion of human time and ingenuity, is one which we must here dismiss with the observation that it rests upon an assumption which has been not less kean, and perhaps scarcely less futilely discussed. The second question is, What is the end of government? for it is clear that the end-in-itself (the telos-tetos) is discovered, we might limit the discussion as to the best form of government to an inquiry into the means which led most directly to the attainment of this end. Now there are, and have always been, two classes of speculators, who assign what appear to be different, and what by many are believed to be irreconcilable ends or objects to government, and indeed to human effort, separate as well as aggregate. By the one, the end of government is said to be 'the greatest happiness of the greatest number,' or the greatest amount of human happiness absolutely considered; by the other class, it is said to be the realisation of the idea of humanity—that is to say, of the divine conception of human nature, through the instrumentality of society. The manner in which the first or Utilitarian creed has recently been expounded by its most important adherents, has had the effect of shewing that the two ends are not at all in reality coincident, and that Mr. Mill must not be allowed as to render it identical with moral, intellectual, and physical perfection, the advocate of the ideal end acknowledges that its attainment would involve, of necessity, the realisation of his own aspirations.
GOWER—GOWRIE CONSPIRACY.

A difference of opinion as to the objects of government scarcely more real, though attended with far more fatal consequences than that which has divided speculative politicians, has roused those who have dealt with government as a practical art in two opposite schools. By the one school, its object is said to be order; by the other, liberty; and each of these objects has been supposed to be attainable only to an extent proportioned to that to which the other is sacrificed. A truer insight into the laws of society has led a more enlightened school than either entirely to reverse this latter opinion; and—whilst holding the two objects referred to, to be in truth the proximate objects of all government—to deal with the means of combining both, so that each is attainable only in and through the other, and that the perfection with which either is realised in any particular instance will be, not in inverse but in direct proportion to that to which the other is sacrificed, is the principle by which conflicting claims to liberty are reconciled. The principle which is really opposed to liberty is licence, in virtue of which the sphere of the liberty of one man is endeavoured to be carried into the sphere of that of another. To the extent to which this takes place, the liberty of both is sacrificed, for the territory in dispute is free to neither of the claimants; whereas order, by preserving the boundary between them, assigns to each the portion which is his due, and prevents the waste of liberty which is necessarily involved in the gratification of licence, and the consequent existence of anarchy. The reasons which have led men to believe that the union between the principles of order and liberty, which is thus their mutual interest to effect, can, in large states, be effected by means of representative institutions better than by any other political expedient that has yet been devised, will be explained under REPRESENTATIVE GOVERNMENT.

See also CONSTITUTION, MONARCHY, DEMOCRACY, LIBERTY, EQUALITY and FRATERNITY.

GOWER, JOHN, the date of whose birth is unknown, probably about 1520, is supposed by his latest biographer, to have belonged to the county of Kent. His history is enveloped in almost total obscurity, but he seems to have been one of the most accomplished gentlemen of his time, and to have been the possessor of considerable landed property. He was a personal friend of Chaucer’s, who addresses him as ‘a moral Gower’ in dedicating to him Troilus and Cressida—a epithet which has indissolubly linked itself to his name. He did not long survive his great contemporary, having died in the autumn of 1468. G. was a voluminous writer, and produced the Sylva Maligna (a poetical discourse on the duties of married life). It consisted of ten books, written in French verse, but is supposed to have perished; the Vox Clamantist, in Latin (of which there are manuscript copies in the Cottonian and Bodleian libraries); and the Confezio Amaustis, by which he is best known, in English. This latter work, extending to the tremendous length of 30,000 verses, was first printed by Berthelet in 1573. An excellent edition of the works of G. was published in 1857, under the editorial care of Dr Reinhold von Zastrow. A critical and critical

G. is almost uniformly hearty and pious. Writing much in French, his English poem is full of Norman-French words, and in his native tongue he never attained Chaucer’s ease and mastery. Apart from literary merit or deficient, his poem is interesting to the scholar and the antiquary, because therein the elements which form our modern English are found side by side, or but indifferently fused together.

GOWRIE, CARSE OF. See PERTHSHIRE and CARSE.

GOWRIE CONSPIRACY, one of the most singular events in the history of Scotland, took place in August 1560. On the 5th of that month, the Duke of Lennox, placed by James V. of Scotland on the throne of Scotland, died, and his successor was thus thrown into a state of disorder. The family of Gifford, who claimed to have been a great-grandson of the last chief of the Giffords of Lennox, and the Giffords of Leith, was going about to hunt, Alexander Ruthven, brother of the Earl of Gowrie, whose father had been executed for treason in 1564, came to his majesty, and informed him that, on the previous evening, he had seized a person of recognized appearance, and evidently disguised, with a pot full of foreign gold hid under his cloak, and had confided him in his brother’s house at Perth. Conceiving him to be an agent of the pope or the king of Spain, and the king agreed to examine the man himself, and without waiting to change his horse, set out for Perth, attended only by the Duke of Lennox, the Earl of Mar, and about 20 others. Soon after his arrival, while his retinue were at dinner, Ruthven conducted the king up a winding staircase and through several apartments, the doors of which he locked behind him, and brought him at last to a small study, where stood a man in armour, with a sword on one side and a dagger on the other, the dagger from the master’s circle. Ruthven held it to the king’s breast, and said: ‘Who murdered my father? Is not thy conscience burdened by his innocent blood? Thou art now my prisoner, and must be content to follow our will, and to be used as we list. Seek not to escape: utter but a cry, make but a motion to open the window, and this dagger is in thy heart.’ The king expostulated with Ruthven, who so far relented that he went to consult his brother, leaving the king in charge of the man in armour. In the meantime, one of Gowrie’s servants hastily entered the apartment where the king’s retinue were, and announced that the king had just ridden off towards Falkland. All hurried into the street, and the earl, with the utmost eagerness, called for their horses. On Alexander Ruthven’s return to the king, he declared that there was now no remedy, but that he must die, and proceeded to bind his hands with a garter. The king grasped him with him, and a fierce struggle ensued, Ruthven towards a window looking into the street, which the man in armour had opened, the king cried aloud for help. His attendants knew his voice, and hastened to his assistance. Lethally stabbed him twice with his dagger, and thrust him down the stair, where he was killed by Sir Thomas Erskine and Sir Hugh Herries. On the death of his brother, Gowrie rushed into the room, with a drawn sword in each hand, followed by seven retainers, well armed, and was instantly attacked. Pierced through the heart by Sir John Ramsay, he fell dead without uttering a word. The inhabitants of Perth, by whom Gowrie was so beloved, were much shocked by his death, hearing of his fate, ran to arms, and, surrounding the house, threatened revenge. The king addressed them from a window, and admitted that the man in armour was the man in question, and that the steps taken by the king and his ministers were justified in the circumstances, on which they dispersed, and he returned to Falkland. Three of the earl’s servants were executed at Perth. The man in armour, Andrew Henderson, the earl’s steward, was pardoned. All who were examined were totally ignorant of the motives which had prompted the brothers Ruthven to such a deed, and they still remain in some degree of mystery, although recent
GOYA Y LUCIENTES—GRAAL

discoveries have led to a pretty general belief that the
object of the conspirators was to possess them-
soever of the king's person, to convey him by water
to the Fast Castle, and either to give him the
England, or to administer the government in his name
in the interest of that country and of the Presby-
terian leaders at home. Most of the documents
relating to the plot are printed.

GOYA Y LUCIENTES, FRANCISCO, the most
distinguished painter of the New Spanish school,
was born at Fuente de Todos, in Aragon, 31st
March 1746, and received his first education
in the academy at San Luis, Saragossa. On
his return from a visit to Rome, the talent and
speed with which he executed some paintings for
the royal tapestry manufactury gained the appro-
val of the celebrated Mengs, who superintended
that work. His scenes from the common life
of the Spanish people excited special admira-
tion; but all the productions of his easel during this
early period, to which belong the altar-piece and
the crucifix at the entrance to the choir of the
church of San Francisco al Grande in Madrid, are
marked by simplicity of composition, clarity of truth-
fulness, and a natural and effective chiar-o-scuro.
In 1780, he was elected member of the academy of
San Fernando. From this time, the influence of
Velazquez and Rembrandt is observable in his paintings.
Among the most celebrated of these is a portrait of Charles IV., for which he was
made court-painter. In general, his portraits were
executed with great felicity and ease. In 1824, he went to Paris for his health, and continued to reside in
France until his death, which took place at
Bedouen, 16th April 1828. Besides his works in oil-colour, G. is celebrated for his essays in fresco-
painting, etching, lithography, and in almost every
department of his art.

GOYANNA, a city of Brazil, in the province of
Pernambuco, is situated on a river of the same name,
35 miles north-west of Olinda. It has numerous
factories and an active trade. Pop. 6000.

GOYAZ, a city of Brazil, is situated on the
river Vermelho, in lat. 16° 21' S., long. 50° 30' W.,
early in the middle of the circumference of the
capital of the province, which bears its
name. The city contains about 7000 inhabitants;
and the province, with an area of 313,000 square
miles, has, according to the government returns in 1856, a population of only 150,000, mostly albor-
ginas. The chief productions are cotton, timber,
and cattle.

GOZZO (called by the Romans Gavlo), an island
in the Mediterranean, belonging to Britain, is about
ten miles in length, and about five miles in breadth;
has an area of 36 square miles, and a population of
16,000. Its surface is agreeably diversified, and it
has many fertile valleys. It appears to have been
formerly connected with Malta, from which it is
now separated by a channel four miles in width.
On this account, and from its natural productions,
it is a spot of the highest interest to the naturalist,
while the cyclopean walls of the ' Giant's Tower'
and Roman monuments of a later period excite the
attention of the antiquary. The island abounds in
game, and is much frequented by sportmen.
It produces large quantities of grain and cotton, and is
celebrated for cattle and for a breed of large asses.
From the circumference of its having two harbours,
it is likewise of importance as a naval and
nautical point of view. The chief town is Rabato,
situated near the centre of the island. The British
governor resides in the Castel del Pozzo.

GOZZOLI, Benozzi, a famous fresco-painter,
was born at Florence about the beginning of the
15th c., and studied under Fra Angelico, whose
excellence as a painter of sacred subjects he fully
equalled, if not surpassed. A glow of rejoicing life
seems infused into all G.'s productions. His chief
works are bearing frescoes of his master in the
churches of Orvieto and Rome; his
own style being visible in the paintings he executed
by command of Pietro de' Medici, in a chapel of
the Medici, now Riccardi Palace, in Florence. The
great work, however, on which G.'s fame rests, is
the immense frescoes executed on the north wall of
the famous cemetery, or Campo Santo of Pisa. This
wonderful series of paintings, not inadequately termed
by Vasari una terribilissima opera ('a terrific work'),
was undertaken by the artist at the age of sixty,
and accomplished in sixteen years. The scenes,
which are all scriptural, are 24 in number, and are
still in excellent preservation. G. died in 1452.

GRAAF, REGNIER DE, a celebrated Dutch
physician, was born in Amsterdam, March 11th,
1678, and died at Delft, 31st December, 1753.
He studied at the university of Leyden under Dubois (De le Boë), who is better
known under his Latinised name of Sylvius; and on
the death of the latter, in 1752, would have been
unanimously elected to the vacant chair (he was a Catholic) had not proved an insuperable
obstacle to his appointment. In 1694, when only
twenty-three years of age, he published his Dis-
putatio Medica de Natura et Usi Sueci Pancreas,
which, although containing several errors—as, for
instance, that the pancreatic juice is acid,
and that many diseases, and especially intermittent
fevers, are due to a morbid condition of this fluid
—gained him a great reputation. After a short
residence in France, where he took his doctor's degree at Angers in 1695, he returned to Holland,
and settled at Delft, where his success in practice gained him much envy. He rendered great service to
anatomy in being the inventor of those injections of
the blood-vessels which Swammerdam and Raysch
brought to a state of comparative excellence, and
which are at the present day the basis of our sound
knowledge of most of the tissues of the body.
His publication several dissertations on the organs of
regeneration in both sexes, which involved him in
a prolonged and angry controversy with Swam-
merdam. According to Haller, his death was occasioned
by an attack of jaundice, brought on by the exces-
sive weight of this water, with which he had not
Haller's authority for this assertion. All his works
were collected in one octavo volume, and published
under the title of Opera Omnia in 1677, and they
were republished in 1766 and 1776.

GRAAFF-BRENNET, the chief town of the
division of its own name, is one of the most
important and prosperous towns in Cape Colony. Previously
to 1857, it numbered 4000 inhabitants. During the
ten years immediately preceding, it had risen from
an inland village to be a great centre of commerce, having its public library, its agricultural society, its
banks, and its newspaper. It owes its advancement
partly to its position on the high-road between
Port Elizabeth and the northern boundary. It is
situated on the Sunday, which enters Algoa Bay,
near Port Elizabeth.

GRAAFIAN VESICLES. See Ovary.

GRAAL, GRAAL, or GREAL (a word derived
probably from the old French, perhaps Celtic, greal,
Provençal, graal, medieval Latin, gradalis), signifies
a kind of dish. In the Legend of the Holy Grail of the
middle ages, we find accounts of the Holy Graal—San Gral—a miraculous chalice, made of a single
precious stone, sometimes said to be an emerald,
which possessed the power of preserving chastity,
prolonging life, and other wonderful properties.
This chalice was believed to have been first brought from heaven by angels, and was the one from which Christ drank at the Last Supper. It was preserved by the High Priest of Jerusalem, and was caught in the last drops of the blood of Christ as he was taken from the cross. This holy chalice, thus trebly sanctified, was guarded by angels, and then by the Templars, a Society of knights, chosen for their chivalrous character, who were encamped over it in a temple-like castle on the inaccessible mountain Montsalvage. The legend, as it grew, appears to have been combined with the famous story of Parcival, the famous romancers of the middle ages. The eight centuries of warfare between the Christians and Moors in Spain, and the foundation of the order of Knight Templars, added to its development. The stories and poems of Arthur and the Round Table were connected with this legend. About 1170, Chrestien de Troyes, and after him other troubadours, sang of the search for the holy grail by the Knights of the Round Table, in which they met with many extraordinary adventures. Some have supposed that the story of the connection of the miraculous chalice with the Last Supper and the blood of Christ arose from a wrong division of the words man grail, holy vessel, which, when written myself, royal blood of the Lord; but although the coincidence is curious, there is no good reason to suppose that a pun could have been the foundation of a superstition which spread over Europe. The legend of the grail was introduced into German poetry in the 15th c. by Wolfram von Eschenbach, who took Guido’s tales of Parcival and Titreul as the foundation of his poem, but filled it with deep allegorical meanings. It is more elaborately treated by the author of Titreul the Younger; and much curious information is found in a work, On the Description of the Temple of the Holy Grail, by Boisseree (‘Ueber die Beschreibung des Tempels des Heiligen Graal,’ Munich, 1854).

GRABS. Vessels of from 150 to 300 tons, employed on the Malabar coast. They are broad armed ships, with two or three masts, and unsuited for very heavy weather.

GRACCHUS is the name of a Roman family, of the gens Sempronius, which contributed several famous citizens to the state. First we have Tiberius Sempronius, who was consul in 228 B.C., and commanded in a warlike operation in Corsica and Sardinia. Another Tiberius Sempronius distinguished himself in the second Punic war, and for his success in opposing Hannibal, was honoured with the consulship in 215 B.C., and again in 213 B.C. In those days of despotism, he did much to revive the spirit of the senate and people; with the allies, and 6000 volones, or volunteer slaves (who afterwards gained their liberty as a reward for their bravery), he withstood the Carthaginians in South Italy, defeated Hannibal, and checked Hannibal himself; but after many victories, he at length lost his life, either in battle with Mago, or, according to others, by treachery. Hannibal murdered him with a splendid funeral. Passing by some Gracchi of minor note, as the augur of 203 B.C., the tribune of 189 B.C., and others, we come to Tiberius Sempronius, the father of those two reformers and friends of the people whose fame has overshadowed all the others. He was born about 210 B.C., and for many years occupied a foremost position in the state. He was successively tribune, aulete, praetor, consilium (twice), and censor, and distinguished himself in many public services. He introduced some important constitutional changes, and was often employed on foreign embassies, in which his judgment and conciliatory spirit were of great service to the state. He married Cornelia, the youngest daughter of P. Scipio Africanus, by whom he had twelve children. Nine of these died in his lifetime; a daughter, Cornelia, married Scipio Africanus the younger. The history of his two sons follows:

1. Tiberius Sempronius Gracchus was born about 186 B.C., and was educated with great care and devotion. This story of the Numantines would treat with no other Roman but the son of their former benefactor. He was thus enabled to save from utter destruction an army of 20,000 Romans, who had been massacred, and was at the mercy of the Numantines. But the peace was considered by the aristocratic party at Rome as disgraceful to the national honour, and was repudiated, Mancinus being stripped naked, and sent bound to Gaul, the massacre might thus be rendered void. Disgust and disappointment at this result are said by some, though without good reason, to have determined G. to espouse the cause of the people against the nobles; but a much more feasible ground for his conduct is to be found in the oppressed state of the commons at the time. Being elected tribune, he endeavoured to re-instate the Agrarian Law of Licinius Sesto, and after violent opposition on the part of the aristocratic party, who had bribed his colleague M. Octavius Cæcina, he succeeded in passing a bill to that effect. (For a detailed account of the measure, see AGRARIAN LAW.) Tiberius G., his brother Caius, and his father-in-law Ap. Claudius, were appointed triumvirs to enforce its provisions. Meantime, Attalus, king of Pergamum, died, and bequeathed all his wealth to the Roman people. G. therefore proposed that this should be divided amongst the poor, to procure agricultural implements, and to stock their newly acquired farms. It is said that he also intended to extend the franchise, and to receive Italian and Roman citizens. He also diminished the time which citizens were required to serve in the army. But fortune turned against the good tribune. He was accused of having violated the sacred character of the tribuneship by the deposition of Cæcina, and the Illebi people in large numbers deserted their champion and benefactor. At the next election for the tribuneship, his enemies used all their efforts to oust him; and a violent scuffle having arisen between the opposing factions, G. was slain, along with upwards of 300 others. His surviving friends were imprisoned, exiled, or put to death.

2. Caius Sempronius Gracchus, who was nine years younger than his brother, was possessed of much greater natural powers and had a more comprehensive view. His brother's death, which occurred while he was serving in Spain under Scipio Africanus, deterred him for some years from entering into public life; and the nobles seeing his great abilities, and fearing his influence with the people, endeavoured to keep him as long as possible on foreign service in Sardinia and elsewhere. But at length he unexpectedly returned to Rome, being urged to do so by his friends, who were apprised of his great plans, and who were not averse to join him on his great mission. Guided by the persecution and groundless accusations of his enemies, he stood
for the tribunalship, and was elected in 123 B.C. After bringing forward some measures to take vengeance on his brother's murderers, he set himself to carry out the agrarian law, which, though not repealed, had by the machinations of the nobles been kept in abeyance. The two great aims of his legislation—viz., to improve the condition of the poor, and to curtail the power of the senate and equestrian order, were attained, with vigour, and with unflinching steadiness of purpose. To develop the resources of Italy, and at the same time to employ the poor, he made new roads throughout all parts of the country, repaired old ones, and erected milestones. Law, his zeal, and his unwearying industry in personally carrying out his own measures, even to superintending the execution of the public works, and by his affability and kindly good nature, he gained the esteem and approbation of all men with whom he came in contact. With the equites and the poorer classes, he was in special favour. But he at length fell, as his brother had done, by the intrigue of the nobles. One of his confidantes, named Domitius, was denounced by the opposite faction, and soon succeeded in undermining the influence of Caius by far surpassing him in the liberality of his public measures, and by his benefits to the commons. Q. having stood for the tribuneship a third time, was rejected. Nevertheless, by a series of moves, the history of which is too long for our space, violence was employed against Caius and his party—a fearful struggle took place in the streets of Rome, in which 3000 men are said to have perished. Many others were imprisoned, and afterwards executed. Caius held aloof from the fight, but was at length compelled to seek safety in flight. He escaped to the grove of the Furies with a single slave, who first slew his master, and then himself. The people saw, when too late, the folly of which they had been guilty in abandoning their best friend in the hour of need, and endeavoured to atone for their crime by erecting statues to the brothers G., by declaring sacred the spots where their blood had been shed, and by offering sacrifices to them as to deities. Caius left a son, whose after-fate is unknown.

GRACE is an expression frequently used in Scripture and in theological discussion. Its distinctive meaning is twofold: first, the freest and unmerited favour. According to Aristotle, this is the proper meaning of charis (Gr. grace), even when applied to man. It is a benefit springing out of the liberality and free disposition of the giver, and therefore without any hope or expectation of reward. Applied to God in the New Testament and in theology, it denotes the free outcoming of his love to man; and when man, on the other hand, is said to be in a state of grace, it implies that he is in the enjoyment of this divine love and favour. St. Paul draws a sharp contrast (Rom. xi.) between charis and erga (Gr. works), as mutually excluding one another. And if by grace, then is it no more of works; otherwise grace is no more grace: otherwise work is no more work.

Theologians have distinguished grace into common or ordinary grace, particular grace, and special grace. Particular grace is supposed to denote the love which God has to all his creatures, and the light of nature and of conscience which they all enjoy. Special grace is the love which God has for his elect people, and by which he saves them from sin. This special or saving grace is sometimes also divided in various ways, and spoken of as electing, justifying, sanctifying grace; also in respect of man, as imputed or inherent grace—the grace, that is to say, of Christ's righteousness imputed or reckoned to the account of those that believe on him, and the grace of holy and pious dispositions wrought in the heart by the spirit of God. Grace is also spoken of as efficacious and irresistible, and the relation in which the elect or believing people stand to God is represented as a covenant of grace, in contrast with the primitive relation which Adam bore to his Maker before the fall, which is called a covenant of works.

All these theological discussions have arisen out of the course of extended argument and discussion on divine truth. They are not to be found—at least in their more technical sense—in the New Testament. The chartis of St. Paul is not a logical distinction, but a spiritual fact. It is the loving aspect of God towards the sinner—towards all sinners, whereby all who confess their sins have free access into his favour, and receive the 'adoption of sons.' The technical distinctions of theology, however, are not without their value when rightly apprehended and interpreted. They mark the course of past controversy—they give precision to theological thought—and when not allowed to delude the simpler proportions of divine truth, they may teach needful and important lessons.

GRACE, DAYS OF. See Bill.

GRACES, the goddesses of grace, favour, and gentleness, the sources of all grace and beauty, appear in Homer in indefinite numbers as the attendants of Cytherea (Venus), whom it is their office to bathe and anoint. Hesiod and most other poets mention three G.—Aglaia, Thalia, and Euphrosyne, the daughters of Zeus and Eury-nome. Their worship is said to have been first introduced into Greece at Orchomenus, in Boetia, by Eteocles. The Laconodemonians and Athenians originally recognised only two Graces, called, by the former, Pheuua and Klete; by the latter, Hegemone and Auko. In the early ages, the G. were represented in elegant drapery; at a later period, slightly draped, or entirely nude. They appear holding each other by the hand, or locked in each other's embrace.

GRACIOSA, one of the Azores Islands (q.v.), and the seventh of that group in population and importance.

GRADIENT, a tortoise walking is said, in Alcæus, to be gradient.

GRADIENT, a term used chiefly in connection with railways, to signify a departure of the line from a perfect level.

GRADUAL, in the Liturgy of the Roman and other Western Churches, means that portion of the mass which intervenes between the epistle and gospel, and consists of a few verses of the Holy Scriptures, generally taken from the Psalms. It was originally called the 'Responsum, or ' Cantus Responsorius; but, probably for the sake of distinguishing it from other portions of the service called by the same name, its present appellation has been substituted. The name 'gradual' is derived from the place at which this response was chanted, and which was either the ambo, or chanting pulpit, which is approached by 'steps' (gradus) or the steps themselves, whether of the ambo or of the altar. Originally, as we find from St Augustine, the gradual response consisted of an entire psalm, and in the mass of the first Sunday of Lent the entire of the 91st (89th in the Vulgate) psalm is chanted. In the Ambrosian Liturgy, the gradual is partly from the Old and partly from the New Testament. The gradual, in the Roman liturgy, is always followed by the 'alleluia,' except in penitential time, when a slow and mournful chant, called the 'Tract,' is substituted.
GRADUAL PSALMS.——GRADUATION.

GRADUAL PSALMS, or ‘PSALMS OF THE STEPS,’ or ‘SONGS OF DEGREES,’ a name given both by the Hebrews and in the Christian service-books to the fifteen psalms, 120—134 (119—133 in the Vulgate). The origin of this name is uncertain. The rabbins trace it to a fabulous incident connected with the building of the second temple; others explain it as an allusion to the fifteen steps by which (Ezeckiel xl. 22—25) the temple was reached; others, again, regard these psalms as containing a prophetic allusion to the return from captivity, which, in the language of the Jews, was 'a raising up,' the 154th psalm being the last of the Psalms.

It is said to have been used from the earliest times to allow the officiating priest time, during its performance, to take his place on the steps of the reading-desk, on the steps of the gospel side of the altar. The music is according to the character of the words, and may be either an aria, duet, or chorus. The composition must not be long, as the priest has little leisure to go through during its performance. The best specimens of the gradual are Haydn's Missa in Vano Caro; Salve Regina; or Mozart's Misericordes Domini; Sancta Maria; De Profundis, &c.

GRADUATION, the art of dividing mathematical, astronomical, and other instruments. The simplest problem in graduation is the division of a space into an equal number of parts. This is commonly done by copying from a standard scale, for which purpose a dividing square and a suitable knife for cutting the divisions are used. The dividing square is a hard steel straight-edge, with a shoulder at right angles like a carpenter's square. This is made to slide along the standard scale, and halt at each required division, when a corresponding one is cut upon the rule, &c., by means of a steel straight-edge as a guide to the knife. The original graduation of a straight line into equal divisions, as in making a first standard scale, &c., is performed either upon the principle of Bisection or Stepping. In bisecting, the points of a beam or square (or as) are divided to nearly half the length of the line to be divided; one point is then placed at one end of the line, and a faint arc struck towards the middle: this is repeated at the other end; the small distance between these arcs is then carefully bisected with the aid of a line pointer and magnifier, which gives an accurate half of the line. The half thus obtained is again bisected in like manner, and these quarters bisected again, and so on until the required subdivision is attained. Stepping is performed with delicately pointed sprung-dividers, which are set at once as nearly as possible to the opening of the small division required; then the points are made to step on, leaving at each step a very fine dot; and when it is found that the last dot either falls short of or overpasses the end of the line, the opening is adjusted accordingly, until perfect accuracy is obtained. Thus, if a line were divided into a thousand parts, and each division were of an inch long or too short, the error would amount to a whole division at the end of a thousand steps. The method of bisection is practically the most accurate, and has been adopted by Griffith Bird, Ramsden, Troughton, and other eminent artists in original graduation. Curved lines are divided on this principle. The chord of an arc of 60° is equal to the radius; therefore, the opening of the compasses required for striking the circle gives this arc at once to start with. An arc of 90° in a quadrant, is obtained by bisecting 60°, and adding the half. By continual bisection of 60°, the finer graduations are produced. The amount of care, patience, skill, and durability of the simple instruments of graduation of important astronomical instruments, is such, that not above one or two men in a generation have been found competent to the task, and these have become almost as famous as the astronomers who have successfully used the instruments. It would be out of place here to point out in detail the minute precautions and methods of correction that are adopted in this most delicate manipulation; but, as an example, we may mention the fact, that trougham, when dividing the mural quadrant for the Greenwich Observatory, measured his larger chords from a scale made for the purpose; but before laying these down on the quadrant, he laid the scale, beam-compasses, and quadrant to stand for a whole night, in order to acquire exactly the same temperature, and that neglect of this precaution would have involved a notable amount of error. The necessity of such extreme accuracy will be understood when we come to the application of this instrument to the division of the polar circle. When, for example, the mariner determines his latitude by taking the meridian altitude of the sun, the graduated arc of the limb of the sextant or quadrant he uses represents, practically, the curve of the arc of the globe, as magnified just to the same extent as the radius of the earth exceeds that of the divided arc of the instrument. Supposing this arc to be part of a circle of 60 inches' circumference, each degree will be an inch long. An error of one inch in the division would thus mislead the mariner to an extent of more than four statute miles as regards his position on the waters. But such a ship's quadrant is but a coarse and rude instrument compared with astronomical instruments for measuring celestial angular distances by means of a divided arc; in these, an error of a thousandth part of an inch would be regarded as one of serious magnitude.

The methods of original graduation above described are not practically adopted except for the largest and most important astronomical or geodetical instruments. Ordinary instruments are graduated by dividing them into the length of the scale and a set of already existing divisions. The dividing-plate which is used for common purposes, such as dividing compass rings, &c., is a divided circle with a steel straight-edge, made movable on the axis or arbor of the plate in such a manner that its edge during every part of its revolution shall fall in the exact line from centre to circumference. The ring, protractor, or other instrument to be divided, is clamped upon the plate with its centre exactly coinciding with that of the plate, and the straight-edge is moved round, and made to halt at the required division on the circumference of the dividing-plate, and by using the steel straight-edge as a guide, corresponding divisions are marked off upon the concentric arc of the instrument to be divided. The dividing-engine is a very complex machine, requiring the greatest accuracy and care in its construction; so much so, that the possession of a good one affords means of obtaining a good income, with a moderate amount of labour in using it. Such was the case with the instrument of Mr Parsons of London, who for many years divided the entire proportion of the best theodolites, sextants, &c., that were made in this country. Among the most celebrated dividing-engines may
be mentioned those of Ramsden, Troughton, Simms, and Ross. A detailed account of the construction of these would far exceed our limits. Their principal parts consist of a large circle divided with extreme care by original graduation. This wheel is reached on one edge with teeth as equal and accurate as the divisions; a very carefully constructed endless screw works in these teeth, and is moved through any given number of revolutions, or any measured fraction of a revolution, by means of a treadle or other suitable power; thus making the requisite steps for each division; another part of the machine cutting a fine line at the moment of the halt of each step.

These divisions are cut upon an arc of silver, gold, or platinum, which is soldered or inlaid upon the limb of the instrument, the precious metals being used, on account of the oxidation to which common metals are liable.

GREECE—MAUGA. See MAGNA GRECIA.

GRANZ, the German equivalent for Count (p. v.), Comes, Comes, and for our Earl (p. q). The etymology of the word is disputed, but the most probable conjecture seems to be that it springs from the same root with the modern German raffen and the Anglo-Saxon reafan, to snatch or carry off hastily; and also with the word draf, and the last syllable of sheriff. If this view be correct, the graf, in all probability, was originally a fiscal officer, whose duty it was to collect the revenue of a district. The title first appears in the lex salcver (compiled in the 5th c.), under the Latinised form of Grof.; at a later period, the office is often designated by the Latin equivalent of Comes. Charlemagne divided his whole kingdom into grafie districts (Graefenagen) or counties, each of which was presided over by a graf. The people were in the habit of appointing a representative called the Cent-graf to attend to their interests with the graf, and probably, if necessary, to appeal from his decisions to the central government. Then there was the Stall-graf, or stable-graf; the Comes Stadels, or constable of later times; the Pfalz-graf (Comes Palatii), who presided in the domestic court of the monarch, which as such was the highest court in the realm; the Senat-graf, who was sent as an extraordinary deputy of the king to control the ordinary gut-grafen; and lastly, the Markt-graf, or marquis, on whom the important duty of controlling the border-lands devolved. When feudal offices became hereditary, and the power of the princes of the empire, secular and ecclesiastical, developed itself, the graf gradually ceased to be an officer possessed of real power, and became merely a titled noble. In Germany, in modern times, there are two classes of grafs: those who are representatives of the old grafie families, who held sovereign jurisdiction immediately under the crown (landeshoheit), and who still belong to the higher nobility, their chief taking the title Erbhuch (Illustrious); and those who form the highest class of the lower nobility. The former is a very small, the latter, an extremely numerous class of persons.

GRAFENBERG, a little village in Austrian Silesia, is an extension of the town of Freiwaldau towards the north, and is celebrated as the spot where the water-cure (see HYDROPATHY) was introduced about the year 1828 by Priestnitz. The village is situated at an elevation of 1200 feet above the level of the Baltic Sea; the climate is inimical, and the vegetation scanty. It extends from the valley, half way up the Grafenberge. The lodgings for visitors are partly in the buildings connected with the baths, partly scattered on the declivity of the hill, or in Freiwaldau.

GRAFFITI (Ital. graffito, a scratching), a class of ancient inscriptions which attention has recently been called, and of which several collections have been made, or are in progress. The graffito is a rude scratching or scratching with a stylus, or other sharp instrument, on the plaster of a wall, a pillar, or a door-post. Such scratchings are pretty commonly found on the substractions of Roman ruins, as in the Golden House of Nero, the palace of the Cæsars and the Palatine, and in still greater numbers in Pompeii and in the Roman catacombs. Their literary value, of course, is very slight; but as illustrating the character and habits of a certain class of the ancient Romans, and what may be called the 'street-life' of the classic period, they are deserving of study. A small selection of Pompeian graffito was published in 1837 by Dr Wordsworth; but the most complete, or, at all events, the most popular collection, is that of Padre Garrucci, a Neapolitan Jesuit, which was published in Paris in 1856. Greek graffiti occasionally are found upon Roman ruins, but they are commonly in Latin, and in a few instances at Pompeii, in the ancient Osan. A few specimens may not be uninteresting.

Some of them are idle scratchings, such as we may suppose some boyer to indulge at the present day; thus, some linger at the door of a wine-shop at Pompeii amuses himself by scratching on the door-post the tavern-keeper's name—Tiberius Appius ('Appius's Tavern'), fig. 1. In other cases, we meet with some scrap of rude pleasantry or scandal, such as not unfrequently defaces the walls of our own towns or villages; thus, Augus anit Arabicenius ('August is in love with Arabicenus'), fig. 2. Many rude sketches also are found upon the walls, some of them evidently caricatures, others seriously meant, and grotesque from the extreme rudeness. A great many of the subjects of these sketches are gladiatorial. Here is a specimen (fig. 3):

By far the largest proportion of the graffiti are from Pompeii, but many have also been discovered.
GRAFFITI—GRAFTING.

at Rome, and some of them are of a most interesting character. One discovered by Father Garrucci in 1853 with that of the subterranean chamber of the palace of the Caesars, possesses a strange and truly awful interest, as a memorial of the rude early conflicts of paganism with the rising Christian creed. It is no other than a pagan caricature of the Christians, and of our Lord on the cross, and contains a Greek inscription descriptive of one Alexanderus as engaged in worshipping God. The chamber in which it was found appears to have been a waiting room for slaves and others of inferior grade.

The graffiti of the catacombs are almost all sepulchral, and are full of interest as illustrating early Christian life and doctrine.—See for the whole subject the Edinbrough Review, vol. x. pp. 411—437.

GRAFTING, the uniting of a young shoot (scion) of one kind of plant to a stem (stock) of another kind, so that the scion may receive nourishment from the stock. Grafting has been practised from ancient times, as may be seen from passages in the New Testament, and in Virgil and other Latin classics; although it cannot be certainly traced to a more remote antiquity; and its introduction among the Christians is due to Roman and Christian missionaries. It is a most important part of the art of gardening, and is practised for various purposes, but chiefly for the perpetuation and propagation of the finest varieties of fruit-trees, which could not be accomplished otherwise than by grafting more rapidly and easily than by layers or cuttings. Besides this, however, grafting is of great use in hastening and increasing the fruitfulness of fruit-trees; the circulation of the sap being impeded at the junction of the stock and scion—as by a deep wound, removal of bark or the like—more particularly when there is a considerable difference between the stock and scion; and repeated grafting (technically, working) is often resorted to by gardeners to obtain flowers and fruit much sooner than would naturally be the case. Grafting is also employed to turn to account the vigour of a root and stem of which the branches are exhausted or productive, and large crops of fruit may often be thus obtained in a garden, much sooner than by any other means.

In grafting, it is particularly to be attended to that the Alburnum (q. v.) of the scion is brought into contact with the stock. The hard wood of the one never unites with that of the other, remaining separate and marking the place of the operation even in the oldest trees. For scions or grafts, pieces of about six to eight inches long are generally taken from the shoots of the previous summer, with several buds, but portions of shoots of two years old are sometimes successfully employed. The time for grafting is in spring, as soon as the sap begins to appear. The scion should, if possible, be taken from a healthy and fruitful tree, but scions from the extremities of lateral branches are more likely to become speedily fruitful than those from the uppermost branches, where growth is most vigorous. The scions, by being kept for a few days before grafting, so that the stock may rather exceed it, not only in vigour, but in the progress of its spring growth; and for this purpose may be placed in the ground, in a rather dry soil, sheltered from the direct rays of the sun. Scions may be kept for some time, and easily carried to a distance, by sticking their lower end into a potato. The end should always be freshly cut off when the scion is to be used. There are various modes of grafting. Cleft-grafting (fig. 1) is very commonly practised when the stock is very considerably thicker than the scion. The stock being cut over, is cleft down, and the graft, cut into the shape of a wedge at its lower end by a sharp thin knife, is inserted into the cleft. This mode of grafting is particularly applicable to branches of large trees, when the introduction of a new variety of fruit, or increased fruitfulness, is sought. Cross-grafting is used for still thicker stocks, which are cut across the stock at the point of the cleft down by two clefts crossing one another at right angles, two scions being inserted close to the bark in each cleft; or no cleft at all is made, and any desired number of scions obliquely cut away on one side are simply inserted between the bark and wood of the stock, the operation in this case being deferred till the bark readily parts from the wood. In this kind of grafting, a longitudinal slit in the bark of the stock, opposite to each graft, is advantageous. Tongue-grafting (fig. 2) is the mode most commonly practised for young trees in nurseries. For this, it is necessary that the stock and the scion should be of not very different thickness. A slit or a very narrow angular incision is made in the centre of the stock downwards, and a similar one in the scion upwards, both having been first cut obliquely, at corresponding angles, and the tongue thus made in the scion being inserted into the incision in the stock, they are fastened very closely and thoroughly together. In Saddle-grafting, the end of the stock is cut into the form of a wedge, and the scion is affixed to it, the base of the scion having been cut or slit up for the purpose. Shoulder-grafting (fig. 3), used chiefly for ornamental trees, is performed by cutting obliquely, and then cutting across a small part at top of the stock, so as to form a shoulder, the scion being cut to fit it. Peg-grafting, is now
GRAHAM.—GRAHAM.

much in use, is accomplished by making the end of the scion into a peg, and boring the top of the stock to receive it.

Whichever of these modes of grafting is adopted, the graft must be fastened in its place by tying, for which purpose a strand of bast-matting is commonly used. The access of air is further prevented by means of clay, which has been worked up with a little chopped hay, horse or cow dung, and water, and which is then applied to the place to which the scion is to be fastened, so as to form a ball, tapering both upwards and downwards. In France, a composition of 28 parts black pitch, 28 Burgundy pitch, 16 yellow wax, 14 tallow, and 14 sifted ashes, generally used instead of clay. Quita-percha, applied in a soft state, has also been used, or even blotting-paper held fast by stripes of sticking-plaster. The progress of the buds shows the union of the graft and stock, which is generally safe to the cutting of clay in less than three months; and the figures, although then loosened, are allowed to remain for some time longer. From some kinds of fruit-tree, fruit is often obtained in the second year after grafting.

Budding (q. v.) is in principle the same as grafting; and Flute-grafting is a kind of budding in which a ring of bark is used instead of a single bud, and a stock of similar thickness having been cut over, a small, but not delusive, quantity of bark is removed, and the graft inserted.

This is commonly performed in spring, when the bark parts readily, and is one of the surest modes of grafting.—Pruning (q. v.), or grafting by approach, in which the scion is not cut off from its parent stem until it is united to the stock, is practised chiefly in the case of some valuable shrubs kept in pots, in which success by the ordinary methods is very doubtful.

An effect is produced by the stock on the scion which it nourishes analogous to that of a change of soil; much of the vigour of a strong healthy stock is also communicated to a scion taken even from an aged tree. There is, moreover, in some degree, an influence of not elaborately sap-descending from the scion on the stock which supports it. An important part of the practical skill of the gardener or nurseryman consists in the selection of the proper kinds of stocks for different species and varieties of fruit-trees. The stock and scion, however, must not be of species extremely dissimilar. No credit is due to the statements of ancient authors about vines grafted on fig-trees, apples on pears, &c., the semblance of which can only have been brought about by some delusive sap; for all attempts at grafting fail except among plants of the same genus, or at least of the same natural family.

Herbaceous plants with firm stems, as dahlias, are sometimes grafted. Some kinds of plants, of small size in pots, are placed in moist hothouses or hot-beds, under bell-glasses, whilst the junction of the scion and stock is going on, which in these circumstances takes place very surely and very expeditiously. But an accumulation of too much moisture under the bell-glass must be guarded against.

GRAHAN'NO, a town of 10,470 inhabitants, in the province of Naples, two miles south-east of Castellamare, is situated on the flank of Mount Gaurano, from which it is said to have derived its name. The origin of this town dates from the great eruption of Vesuvius in 79 a. m., when the inhabitants of Sibilia, in dread of the vicinity of the volcano, fled from their dwellings, and sought refuge on the mountain of Gaurano. It lies in a beautifully picturesque neighbourhood, which produces excellent wines, and has good macaroni manufactories.

GRAHAM, FAMILY OF. See MONTROSE.

GRAHAM, SIR JAMES ROBERT JEREMY, 2ND

RIGHT HONORABLE, OF Netherby, Cumberland, statesman, eldest son of Sir James, the first baronet, by Lady C. Stewart, eldest daughter of the seventh Earl of Galloway, born January 1, 1792. The Graham of Netherby are a junior branch of the Grahams of Eek, Viscounts of Preston, descended from the Earl of Stratherns and Menteith. G. was educated at Westminister School, whence he proceeded to Queen's College, Oxford. He afterwards became private secretary to Lord Montgomerie, the British minister in Sicily, during the most critical period of the war and the entire management of the mission devolved upon him at a most important moment, in consequence of the illness of his chief. On the arrival of Lord W. Bentinck, he was continued in his post, and he afterwards accepted a military situation attached to the person of Lord William, who was commander-in-chief in the Mediterranean. He was sent in this capacity to Murat, with whom at Naples, he negotiated the armistice which separated that general from Napoleon. In 1818, he was returned for Hull at the general election, and in 1820, lost his seat, and some years elapsed before he re-entered parliament. In 1824, he succeeded to the baronetcy on the death of his father. In 1826, he was returned for Carlisle as a Whig, and as warm supporter of Catholic emancipation. He displayed so much ability in opposition, that Earl Grey offered him, in 1830, the post of First Lord of the Admiralty, with a seat in the cabinet. He was also one of the committee of the cabinet appointed to discuss and report the provisions of the First Reform Bill. He was at this time very popular with the extreme liberal party, and was supposed to be, of all the members of the Grey cabinet, most favourable to radical changes. In 1834, he seceded from the government, with Mr Stanley, holding the appropriation clause of the Irish Church Temporalities Act. He refused to join the Peel administration in that year, but gradually in opposition approximated to the politics of that statesman; and in 1841 became Secretary of State for the Home Department in the government of Sir Robert Peel, who, on one occasion declared that G. was the ablest administrator and the best man of business he had ever known. In 1844, he issued a warrant for opening the letters of Mazzini, and caused the information thus obtained to be communicated to the Austrian minister, an act by which the ministry, and G. in particular, incurred great obloquy. He also encountered great displeasure north of the Tweed by his high-handed method of dealing with the Scottish Church during the troubles which ended, contrary to his anticipation, in the Disruption, and the formation of the Free Church. He gave Peel a warm support in carrying the Corn Law Repeal Bill, and resigned office with his chief as soon as that great measure was carried. On the death of Peel in 1850, he became leader of the Peelite party in the Lower House, and led the opposition to the Ecclesiastical Titles Bill. In December 1852, he took office in the Coalition Ministry of the Earl of Aberdeen, and accepted his old office of First Lord of the Admiralty. This was a post much desired by G., but he held it until February 1855. G. refused to take office either in the first or second administration of Lord Palmerston, but he gave that minister a general support. He became, from disease of the heart, October 25, 1861. When the House of Commons again met, it felt that it had lost one who stood in the first rank of statesmen. His commanding stature, fine personal presence, his
calm and impressive delivery, his ripe and gentle wisdom, wounded forth in a stream of quiet, yet
withal, so much reasoned and so much made him the Nestor of the House of Commons. Yet his changes of opinion, from the Whiggism of his youth to the vehement Conservatism of his manhood, and the Radicalism of his old age, exposed him to incessant and ill-founded censures and political calumny."

GRAHAM, JOHN, VISCOUNT DUNDEE, was the eldest son of Sir William Graham of Cleaverhouse, head of a branch of the noble family of Montrose, in Forfarshire. He was born in 1643, entered St Andrews university in 1665, served in the French army from 1668 till 1672, next entered the Dutch service as cornet in the Prince of Orange's horse guards, and is reported (but on no good authority) to have saved the life of the prince at the battle of Steenoff in 1674. Returning to Scotland, he obtained (February 1678) an appointment as lieutenant in a troop of horse commanded by his cousin, the third Marquis of Montrose. At this time, the government of Charles II was engaged in its insane attempt to force Episcopacy upon the people of Scotland. A system of fines and military coercion had been carried on for years against all nonconformists; conventicles and field-preachings were punished; but with indifferent success, on all whose hearth the remnant retaliated, and the nation lay at the mercy of informers. Maddened by oppression, and fired by a fierce zeal for the Covenant, the people flew to arms; but their efforts were ineffectual and disordered, and each successive failure only aggravated their sufferings. Many were executed, the jails were filled with captives, and those who fled were outlawed, and their property seized. In this miserable service, G. now engaged. He massacred four or five hundred remanants at Drumlog, June 1, 1679, but was defeated, about forty of his troopers being slain, and himself forced to flee from the field. Three weeks afterwards (June 22), he commanded the cavalry at Bothwell Bridge, where the royal forces, under the Duke of Monmouth, achieved an easy victory over the Covenanters. In this battle, three or four were killed while defending the bridge, but in the pursuit, 4000 were overtaken and captured by Sir James Graham, and 1200 surrendered unconditionally, to be afterwards treated with atrocity inhumanity. These affairs at Drumlog and Bothwell are the only contests that can even by courtesy be called battles in which he was engaged in Scotland previous to the abdication of James II. They gave no scope for valour, and displayed no generalship. In his other duties—pursuing, detecting, and hunting down unyielding Covenanters—G. evinced the utmost zeal. He rose to the rank of major-general, was sworn a privy councillor, had a gift of the crown of the estate of Dudhope, and was made constable of Dundee. In 1688, on the eve of the Revolution, he was raised to the peerage by James II as Viscount Dundee and Lord Graham of Cleaverhouse. When the bigotry of James had driven him from the throne, Dundee remained faithful to the interests of the fallen monarch. He was joined by the Jacobite Highland clans and by auxiliaries from Ireland, and raised the standard of rebellion against the government of William and Mary. After various movements in the north, he advanced upon Blair in Athol, and General Mackay, commanding the government forces, hastened to meet him. The two armies confronted each other at the Pass of Killiecrankie, July 27, 1689. Mackay's force was about 4000 men; Dundee's, 2300 foot, with one troop of horse. A few minutes decided the contest. After both armies had exchanged fire, the Highlanders rushed on with their swords, and the enemy instantly scattered and gave way. Mackay lost by death and capture 2000 men; the victor, 900. Dundee was created Duke of Dundee March 1, 1681; and was made the head of his battalions to advance. He was carried off the field to Urrard House, or Blair Castle, and there expired. In the Bodleian Library, Oxford, is preserved the letter-book of Nairne, private secretary to James II, and in this book is the copy of a letter purporting to be written by Dundee after he had received his death-wound, giving James a short account of the victory. The letter was first published in Macpherson's Original Poems, and has been treated as a forgery; but Nairne could have had no conceivable motive for forging such a document, which remained unprinted above eighty years.

The character and services of Dundee have been greatly exaggerated and blackened by party spirit. With the Jacobites, he was the brave and handsome cavalier, the last of the great Scots and gallant Grasams. With the Covenanters, he was 'bloody Cleaverhouse,' the most cruel and ravenous of all the mercenary soldiers of that age. He was neither the best nor the worst of his class. As a military commander, he had no opportunities for display. He was the hero of only one important battle, and in that fell by a musket-shot while waving on the flank of his position. As a persecutor, he did not, like Dalley, introduce the thumb-screw, nor, like Grierson of Lugg, drawn helpless women at stakes on the seashore. In 'any service I have been in,' he said, 'I never inquired further in the laws than the orders of my superior officers;' and in Scotland he had very bad superior officers—low-minded, cruel, relentless taskmasters. It was fortunate for his reputation that he died after a great victory, fighting for an exiled and deserted monarch. This last enterprise has given a certain romantic interest to his name and memory.

GRAHAM, THOMAS, a celebrated living chemist, was born in Glasgow in 1804. Having studied at Glasgow and Edinburgh, he became, in 1839, Professor of Chemistry at the Andersonian University, and continued in that office till 1837, when he succeeded Dr Turner in the chemical chair of University College, London. In 1855, he was appointed Master of the Mint, and resigned his professorship. From the year 1861, when he retired from the Mint and the chair of Chemistry, for the Formation of Alcools, Definite Compounds of Salts and Alcohol,' appeared in the Transactions of the Royal Society of Edinburgh, to the present time, he has been constantly publishing important contributions to chemistry. Amongst the most important of his memoirs we may mention the following: 'On the Law of Diffusion of Gases' (Tr. R. Soc. Edin., 1834); 'Researches on the Arseniates, Phosphates, and Modifications of Phosphoric Acid' (Phil. Tr. 1833); 'On the Motion of Gases, their Diffusion and Transpiration' (Ibid. 1846 and 1849); 'On the Diffusion of Liquids' (Ibid. 1850 and 1851); 'On Osmotic Force' (Ibid. 1864); 'Liquid Diffusion Applied to Analysis;' and 'On Liquid Transpiration in Relation to Chemical Composition' (Ibid. 1861). In addition to these memoirs, he has brought out an excellent treatise on Chemistry, which has passed through two editions. G. was one of the founders of the Society of Arts, and President of the Chemical and Cavendish Societies, is a Fellow of the Royal Society, and has more than once been appointed one of its vice-presidents. He has likewise frequently been placed by government on important scientific commissions.

GRAHAME, JAMES, a Scottish poet, son of a legal practitioner, was born in Glasgow, April 22, 1765, and was educated at the university of
that city. He removed to Edinburgh in 1784, where he commenced the study of law, under the tuition of a relative, and was admitted a member of the Society of Writers to the Signet in 1791, and in 1795, of the Faculty of Advocates. Finding the legal profession unsuited to his tastes, and having a sufficiency of worldly means, he withdrew from professional practice, and devoted himself to the cultivation of his muse. He had long regarded the life and duties of a country clergyman with a remaining interest, and, on the death of the incumbent, he took orders in the Church of England, being ordained by the Bishop of Norwich on Trinity Sunday, the 28th May 1809. He was successively curate of Shipton in Gloucestershire, and of Sedgfield in the county of Durham. Ill health compelled him to abandon his sacred duties, and he returned to Scotland; spending a few days in Edinburgh, he proceeded to Glasgow, and died at his brother's residence, near that city, on the 14th September 1811, in the forty-seventh year of his age.

G. has left behind several poetical works, the chief of which are—Mary Queen of Scots, a dramatic poem; The Sabbath; The Birds of Scotland; and The Sands of Galilee. It is on The Sabbath that his fame rests. He was a retiring, amiable, and affectionate man, and possessed a deep love for nature, and those passages in his poems are the best that give utterance to that love. There was nothing bold or mounting in his genius, but he had a plentiful command of musical verse and rural imagery.

GRAHAME'S or HOTHAM'S ISLAND. A mass of dust, sand, and scoriae thrown out of a submarine volcano in the Mediterranean, and which remains; it was seen by the masters of the vessel of the name, received these names. It made its appearance about thirty miles off the coast of Sicily, opposite to Sciacca, in July 1831. In the beginning of August, when the action of the volcano had ceased, it had a circumference of about a mile and a quarter, the highest point was estimated at 170 feet above the sea, and the inner diameter of the crater about 400 yards. As soon as the eruption ceased, the action of the waves began to reduce the island, and before many months transpired, the whole mass of scoriae and sand disappeared, being scattered as a stratum of volcanic cinder in that portion of the bed of the Mediterranean.

GRAHAM'S LAND, an island of the Antarctic Ocean, discovered by Biscoe in February 1832, lies in lat. 64° 45' S., and long. 62° 51' W., being nearly on the meridian of the east extremity of Tierra del Fuego, and within a comparatively short distance of the polar circle. The position, as above defined, is precisely that of Mount William, the highest spot. In front, towards the north, are a number of islets, called Biscoe's Range. No living thing, excepting a few birds, appears to exist.

GRAHAM'S TOWN, the capital of the eastern province of the Cape Colony, stands near the centre of the mountain district of Albany. It is about 25 miles from the sea, in lat. 33° 19' S., and long. 29° 31' E.; and it contains about 5000 inhabitants, chiefly English. G. T. is the see of two bishops—one of the Church of England, and another of the Church of Rome. It has also several Wesleyan ministers, besides the pastors of the Dutch Reformed Church. Among the other institutions of the place are its banks, insurance offices, a botanical garden, a public library, a general hospital, and some weekly newspapers.

GRAIN (Lat. granum, any small hard seed or particle), a term often used as equivalent to corn, denoting the seeds of the Cereales.
this species, kept in a farmyard, has been known to imitate most of its ordinary sounds, as those of dogs, sheep, pigs, and poultry. Some of the grackles are known as summer birds of passage in the northern parts of America.

GRA'LL.E, or GRALLATO'RES (Lat. stilt-walkers), an order of birds, generally characterised by the form, the姿势 (shank) in particular, being much elongated, and by the nakedness of the lower part of the tibia, adapting them for wading in water without wetting their feathers. They have also generally long necks and long bills. The form of this bill, however, is various; and in its size, strength, and hardness, it is adapted to the kind of food; some, as snipes, which feed chiefly on worms and other soft animals, having a very soft weak bill, whilst others, which feed on larger and stronger animals, have the bill proportionately large and strong. The form of the body is generally slender. The greater number of the G. are inhabitants of the sea-coast or of maraly districts. Many are birds of passage. Even those which are not aquatic are generally driven from the districts in which they frequent either by frost or drought. Cuvier divided this order into Brevipennes (q. v.), (Ostrich, Cas- waway, Enu, &c.); Plesiornis (Bustards, Plovers, Etc.); Coluroptera (Cranes, Herons, Storks, Adjutants, Spoonbills, &c.); Longirostris (Snipes, Curlews, Gdove, Sandpipers, &c.); and Macrorhynchus (Ralls, Crakes, Coots, &c.). The Brevipennes are constituted by some into a distinct order, Curvanidae, and differ very widely in many respects from the true Granll.

GRAM. See CHICK PEA.

GRAMINEE. See GRASS.

GRAMMAR, in its usual sense, and as applied to a particular language, investigates and systematises the facts of that language, as exhibited in the most approved writers and speakers; the main divisions or heads being: (1) the way in which the sounds or spoken words are represented by letters (Orthography); (2) the division of words into classes, or 'parts of speech,' the changes or inflections they undergo, their derivation and composition (Etymology); and (3) the way in which they are joined together to form sentences (Syntax). A book embodying the results of such investigations, with a view to teach what is known as a language (as contrasted with a language to be used and to use it properly), is a grammar of that language.

Languages were not originally constructed according to rules of grammar previously laid down; but grammar rules were deduced from languages already in existence. In the days of Plato, perhaps the greatest master of language that ever wrote, the division of words into classes or 'parts of speech' had not yet been made. Plato himself, according to Max Muller, took the first step in formal grammar by making the distinction of noun and verb, or rather of subject and predicate; for it was a distinction in the ideas or elements of a proposition he was more precise in his choice, rather than in the words themselves. Aristotle and the Stoic philosophers made further advances in the analysis of language, but they attended little to the forms of words, their object being logical rather than grammatical (see GESTURE). It was not until the medieval scholars, engaged in preparing critical editions of Homer and the other Greek classics, who first analysed, classified, and named the phenomena of language as language; and it was one Dionysius Thrax who had been trained in the Alexandria school, and became a teacher of Greek (Grammaticus, from Gr. gramma, a letter; as those who taught boys their Roman letters were called Literatores) at Rome, that published the first practical systematic Greek grammar for the use of his Roman pupils (about 80 B.C.). This work, which still exists, though much interpolated, became the basis of all subsequent grammars, both Greek and Latin; and when grammars of the modern European tongues came to be written, they naturally followed the classical models. The chief matters treated of in grammar are considered under such heads as ADJECTIVE, VERB, NOUN, DECLENSION, DECLINATION.

In quite recent times, the study of language has advanced beyond this empirical stage, in which its object was confined to the explaining and teaching individual languages; and, under the name of Comparative Grammar, has brought to light the resemblances and differences of the various languages of the world, so as to classify them, after the manner of natural history, into families and minor groups, according to their greater or less affinities. Still higher questions, entering into the origin and growth of speech, and seeking to give a scientific account of its phenomena, now occupy the more advanced students of this subject. See LANGUAGE, INFLECTION.

GRAMMAR SCHOOLS received their name at a time when the grammar of the English language was not yet in the hand when all the principles of language could be obtained only through a study of the grammar of the ancient tongues, particularly Latin. The idea which lay at the basis of these institutions still pervades them, and the ancient languages are the principal subjects of instruction. History, geography, and modern languages have of late years been admitted into the curriculum of the great majority of these schools; but these subjects still hold a subordinate place, and distinction in Latin and Greek gives precedence, and is the great object of ambition both to masters and pupils. Nor can it be otherwise so long as the universities recognise the ancient tongues as the only sound basis of a liberal education. For a further notice of the grammar schools of Great Britain, see PUBLIC SCHOOLS, NATIONAL EDUCATION.

GRAMME is the standard unit of French measures of weight, and is the weight of a cubic centimetre of distilled water at 0° Centigrade (corresponding to the oth part of the freezing point of water). The grammes have received names corresponding to the number of grammes they contain, or the number of times they are contained in a gramme: in the former case, the Greek numerals deca, hecto, kilo, mgra, expressing weights of 10 grammes, 100 grammes, 1000 grammes, 10,000 grammes; in the latter case, the Roman numerals deci, centi, are prefixed, to express tenths, hundredths of a gramme. Starting from the relation between the English yard and the French metre, we are enabled to compare the units of weight, and it is found that a grammé = 154.3248 grains Troy, from which the equivalents in English measure for the other weights can easily be found: thus

GRAMONT, a small town of Belgium, in the province of East Flanders, is situated on the banks of the Dender, 20 miles south-south-west of Ghent. It has manufactures of lace, fine linen, and damask and woollen fabrics; and carries on cotton-spinning.
GRAMMONTRAMON-GRANADA.

dying, bleaching, tanning, distilling, and brewing. Pop. about 7500.

GRAMMONT, or GRAMONT, PELIBERT, Count of, a celebrated French courtier, son of Anthony, Duke of Grammont, was born about 1621. While still very young, he served as a volunteer under Condé, and Turenne, and distinguished himself by the most chivalrous bravery. At the court of Louis XIV., with this reputation added to his youth, noble birth, a handsome person, fine talents and accomplishments, a lively wit, and strangely good-fortune at play, at which he won such amounts as to support even his extravagant expenditures, it is no wonder that he became a favourite. He was distinguished for his gallantries, and even had the audacity to aspire to be the rival of the king in the affections of one of his favourites. This caused him to be banished from France; and he found a pleasant refuge and congenial society in the gay and licentious court of Charles II. of England. Three years after many engagements to marry Eliza Hamilton, sister of Anthony, Count Hamilton, he slipped out of London without fulfilling his promise. Two of the lady's brothers and the son of the Frenchman, and coming up with him at Dover, asked him 'if he had not forgotten something.' 'Oh, to be sure,' replied G., 'I have forgoten to marry your sister;' and returned to London to complete his engagement. He then went to France, where his wife became one of the ladies of the court of Maria Theresa of Austria. By this marriage he had two daughters, one of whom was married to Henry Howard, Marquis of Stratford, and the other became Abbess of Poissy, in Lorraine. He died in 1707. See Memoirs of the Comte de Grammont by his brother-in-law, Anthony, Count Hamilton (edited by Sir Walter Scott in 1811; reprinted in Bohn's 'Extra Volumes').

GRAMPIANS, the name of the principal mountain system in Scotland. The system runs from north-east to south-west, forming the well-known high grounds of Aberdeenshire, Kincardine-shire, Forfarshire, and Perthshire. The average elevation of the summits of this main range is from 2900 to 3300 feet, and the highest elevation reached is that of Ben Nevis (4406 feet) at its western extremity. An outlying branch of the G. extends northward from near the head of the valley of the Dee, and includes among its chief mountains Ben Muickshul (4426 feet) and Cairngorm (4005 feet). Southward of the western extremity of the G. are situated numerous groups and chains of greater or less extent. Among these the chief summits are Ben Uraochan (3390 feet), Ben Lomond (3191 feet), Ben More (3818 feet), Ben Lawers (3945 feet), and Schiehallion (3514 feet).

GRAMPIANS, mountains in Australia, run north and south in the west part of Victoria, south of, in lat. from 36° 30' to 37° 45', and in E. long. from 142° 25' to 142° 47'. From their eastern slope flow the Glenelg and its affluent. The loftiest peak of the range, Mount William, is 4500 feet high above the sea.

GRAMPIAN (probably from the French, Grand piozon, great fish), a cetaceous animal, common in the arctic seas, as on the coasts of Greenland and Spitzbergen, not unfrequent in the Atlantic, and well known on the British coasts. It is one of the Delphinidae, or Dolphin family, and is commonly referred by naturalists to the same genus with the porpoise, under the names Phocaena Orca, P. Gramnus, and P. gladiatrix, although a new genus, Gramnus, has also been proposed for it. It is the largest of the Delphinidae, often more than twenty feet in length; its form spindle-shaped, but thicker in proportion than the porpoise, from which it also differs in the much greater height of its dorsal fin, in the upper jaw projecting a little over the lower, and in the smaller number of teeth, which are about eleven on each side in each jaw. The tail is powerful; in a specimen twenty-one feet long, it was found to be seven feet broad. The G. is generally seen in small herds. It is very voracious, and pursues salmon up the mouths of rivers as far as the tide reaches. Marvellous stories are told of attacks which it makes on the whale, and of its tearing out and devouring the whale's tongue, but even the least improbable require confirmation. The G. possesses great strength and activity.

GRAN (Mag. Exteriores), a town of Hungary, is finely situated on an elevation on the right bank of the Danube, 25 miles north-west of Pesth. It is a royal free-town, is the see of the primate of Hungary, and is rich in fine buildings. Pop., including the suburbs, 12,700. G., which is one of the oldest towns of Hungary, was the residence of the Hungarian prince, Geza; and here his son, St Stephen, the first king of Hungary, was born in 973, and converted to Christianity in 1000. It was formerly fortified, and has undergone assaults and sieges almost without number.

GRAN SASSO D'ITALIA ('Great Rock of Italy'), also called MONTE CORSO, from the resemblance to a horn which it presents on the east, is the highest summit of the Apennines, having an elevation of 10,296 feet. It is situated on the borders of the Abruzzi, between Teramo and Aquila. It owes its name partly to its height, and partly to its being formed of a single mass of calcareous earth from its middle to its summit. It is seen to great advantage from the side of Teramo, where it is broken into tremendous precipices. The summit is covered with perpetual snow. Wolves, bears, and chamois abound on the mountain—the last of these animals being found in no other part of the Apennines. The general character of the scenery is more Alpine than Apennine, and in wild grandeur and variety it is not surpassed by any landscape in Italy. To the painter, geologist, and botanist it affords a rich field for their respective pursuits. See Itinerary of F. Caldane.

GRANADA, an ancient kingdom, and one of the old provinces in the south of Spain, was bounded on the W. by Andalusia, on the E. by Murcia, and on the S. and S.E. by the Mediterranean. Its
GRANADA—GRANBY.

Greatest length from north-east to south-west was about 210 miles, and its greatest breadth about 90 miles. It is now divided into the three modern provinces of Granada, Almeria, and Malaga, the united areas of which amount to 11,633 square miles, and the united population, in 1857, to 1,211,699. The surface of this ancient province is mountainous and picturesque in a high degree. The mountain-ranges—Granada to the Sierra Nevada, the Sierra de Ronda, and the Alpujarras—as a general rule, run parallel with the coast. The principal rivers are the Almanzora, Almeria, Jenil, Guadalhorce, and Guadalete; all of which run directly to the Jenil, an affluent of the Guadalquivir, flow into the Mediterranean. The province of G. is, on the whole, fruitful and highly cultivated. The mountains are rich in silver, copper, lead, and iron; and many of the inhabitants are engaged in mining and smelting. Saline and mineral springs abound.

In the time of the Romans, G. was a portion of the province of Bocetia; but after the Arab invasion it formed an independent Moorish kingdom. For a time it was exceedingly wealthy, having developed great agricultural and commercial resources. From the year 1248 the Moorish kings of G. were obliged to recognise the supremacy of the kings of Castile. A quarrel, however, which arose between the vassal king of G. and Ferdinand and Isabella in the 15th c., resulted in a war of eleven years' duration, the consequence of which was the complete conquest of G. by the Spaniards in 1492; and the total destruction of Moorish authority in Spain.

GRANADA (Spanish, Granata, Arab. Garna-thah, said to be a corruption of Karnadidz, the ancient fortress of Pharanusian origin), a famous city of Spain, formerly capital of the kingdom of Granada, and now chief town of the modern province of the same name, is built on a northern branch of the Sierra Nevada, at an elevation of 2,445 feet above sealevel, in lat. 37° 15' N., long. 3° 45 W., and is about 140 miles east-south-east of the capital of the kingdom. It is situated on the right bank of the Jenil, overlooking the fertile and extensive Vega or plain of G., and is watered also by the Darro, a rapid mountain-stream, which joins the Jenil about a mile below the town. Though now sadly decayed, it is still one of the greatest towns of Spain, is the seat of an archbishop, and has a university, attended, it is said, by about 800 students. One of the two hills on which the town is mainly built is surrounded by the Alhambra (q. v.); the other hill is occupied by the city which is called the Albayzin, the oldest part of the town, and now inhabited almost entirely by gipsies. The city of G. proper, namely, that portion of it that contains the Alhambra, is surrounded by high but ramos walls, and by strong towers. The streets are narrow, crooked, and uneven; the houses, which for the most part are well built, are heavy and gloomy in outward appearance, having the flat roofs and projecting balconies of the Moorish style of architecture; the interiors, however, are convenient and suitable to the climate. G. has several charming public squares. The cathedral, a splendid structure, profusely decorated with jasper and china, and having a high altar placed under a dome, supported by 22 pillars, contains the monuments of Ferdinand and Isabella, and of Philip II. and his consort Juana. The industry and trade of the town are quite considerable. Pop. 63,471.

The modern city of G. was founded by the Moors in the 8th c., and for some time remained subject to the califs of Cordoba; but in 1235 it became capital of the kingdom of Granada, and rapidly rose to distinction as a wealthy trading city and as the seat of arts and architecture. Under the Moors, it attained the highest pitch of its prosperity. Toward the close of the 15th c., it is said to have had 400,000 inhabitants, and to have been surrounded by a wall of 1,210 feet in circumference, and the height of G., in front of the city, was celebrated for two hundred years as the scene of contest between the Moors and the chivalry of Christendom—a contest which was brought to a termination only by the capture and complete subjection of G. by Ferdinand and Isabella in 1492, after a siege of twelve months.

GRANADA, a city of Nicaragua in Central America, stands on the north-west side of the lake which bears the name of the state. In 1854, including the suburbs and municipality of Jalapa, it had a population of from 12,000 to 15,000, contained seven churches, an hospital, and nominally a university, and was the thriving seat of many commercial establishments. It suffered greatly, however, from the civil war that broke out in the republic during that year, and was under siege from May 1854 to February 1855; but was bravely and successfully defended by Don Fructo Chamorro, the leader of the conservative party. In 1856, Chamorro having been the meantime died, G. was surprised and taken by the democrats, but was retaken and almost wholly destroyed in the following year. After the conclusion of peace, efforts were made toward the restoration of the city. It has not yet, however, regained its former prosperity and importance.

GRANADILLA, the edible fruit of certain species of Passion-flower (q. v.). The name, originally bestowed by Spanish settlers in the West Indies and warm parts of America, is a diminutive of granada, a pomegranate. 

The COMMON (Passiflora quadrangularis) is extensively diffused over these regions, and much cultivated. The plant is a luxuriant and very ornamental climber, often employed for arches and covered walks; it has large, beautiful, and fragrant flowers; oblong fruit, often six inches in diameter, of an agreeable fragrance, and a sweet and slightly acid pulp, very gratefully cooling. It is often eaten with wine and sugar.—The Apple-fruited G., or Sweet Calaba (P. maliformis), is plentiful in the woods of Jamasica, where it forms a principal part of the food of wild swine. It is, however, a very agreeable fruit, about two inches in diameter, its pulp gelatinous, thin and not at all hard as to be able to be put into muffins and boxys. The Laurel-leaved G. (P. laureifolia), sometimes called water-lemon in the West Indies, is a fruit about the size of a hen's egg; the plant has red and violet fragrant flowers, and very long tendrils. The fruit has a white pulp, so watery, that it is usually sucked through a hole in the rind; it has a delicious flavour, and a slight acidity. It is much cultivated.—Several kinds of G. are occasionally cultivated in hothouses in Britain. In the south of Europe, they grow in the open air.

GRANARY WEEVIIL, another name of the Corn WEEVIIL (q. v.).

GRANBY, JOHN MANNERS, MARQUIS OF, an English general, the eldest son of the third Duke of Rutland, was born January 2, 1721. Educated at Eton and Cambridge, he was at an early age elected M.P. for Grantham. In the rebellion of 1745, he raised a regiment of infantry, and accompanied the Duke of Cumberland into Scotland. Appointed one of the officers of the king's bodyguard in February 1759, he received the rank of lieutenant-general, and soon after was sent to Germany, as second in command, under Lord George Sackville, of the British troops, co-operating with the king of Prussia. After the battle of Minden, for
his conduct in which he received the thanks of Prince Ferdinand of Brunswick, to the disparagement of his superior officer, who resigned, and was afterwards cashiered, he was appointed commandant-in-chief of the British troops, and held that post during the remainder of the Seven Years' War. He particularly distinguished himself at the battles of Warburg in 1750, of Kirchdenkern in 1751, and of Grebenstein and Homburg in 1762. In the latter of these battles the law of the islands, all cases are originally determined by their own officers, the bailiffs and jurats of the island, who administer a code of laws based upon the Grand Coutumier. From their decision, an appeal lies to the privy council. Acts of the British parliament are not in force in these islands unless they are specially named.

GRAND DAYS were those days in every term solemnly kept in the Ins of Court and Chancery—viz. in Easter term, Ascension-day; in Trinity term, St John the Baptist's Day; in Michaelmas term, All Saints' Day (and of late, All Souls' Day); and in Hilary term, the festival of the Purification of our Lady, commonly called Candlemas Day; and these are dies non iuridici, no days in court.

Cosed. On these days were formerly held the Revels for which the Ins of Court and Chancery of the day, After dinner, a play was performed by actors, who came full dressed from the Haymarket in chairs, and it is said, refused to receive payment for the honour of the occasion. After dinner, judges, serjeants, and clerks, formed a ring round the stove in the centre of the hall, and danced, or rather walked about the coal fire, according to the old ceremony, three times, and all the time the ancient song was sung by one Toby Aston, dressed in a bar-gown. The Prince of Wales, Frederick, father of George III., witnessed this part of the ceremony.

The room was then prepared for dancing, which was kept up, with the pleasing interlude of a splendid supper, until morning. See Pearce's Ins of Court and Chancery. Grand days continue to be observed, but they have no longer the solemn character formerly attached to them. Nor are they held on the same days as formerly; for by the alteration made in the law terms by 11 Geo. IV. c. 70, those days no longer fall within the term. Grand days are now fixed at the pleasure of the benchers. On these days an entertainment is given in hall to the judges who had formerly been members of the Ins, and on this occasion an additional bottle of wine is supplied to every mess of four men among the barristers and students. On circuits, also, the circuit bar appoints a special day for the grand day, on which, after dinner, the various matters of social interest affecting the circuit are discussed and settled.

GRAND HAVEN, a small but rapidly increasing town in the state of Michigan, U. S., is situated on the eastern shore of Lake Michigan, at the mouth of Grand River, and forms the western terminus of the Detroit and Milwaukee railroad, which has here a most extensive depot and a pier 3000 feet long extending into the lake. It has a spacious and excellent harbour, with a depth of from 30 to 50 feet. It exports timber, fish, leather, gypsum, stucco, and flour. The population has already, in some years, exceeded one million dollars in value. Pop. in 1859, 3000.

GRAND JURY is the assembly of good and sufficient men, summoned by order of the sheriff to attend every sessions of the peace and every
GRAND MASTER—GRAND RIVER.

commission of oye, and terminer and general jail delivery in England, for the purpose of inquiring into the charges for offenses, and of returning to the court their delivery thereon. The institution of the grand jury dates back to the earliest period of the English history, having been in use among the Saxons. By a law of Ethelred it is enacted, 'Exeunt seniores duodecim thani, et prefectus eis, et jure completing the sentence, they are summoned to inquire more accurately, nec aliquando nostrum caras.'—Wilkins, Leges Ang. Sax. 117. From this enactment, it appears that the number of the grand jury was originally twelve; but we learn from Bracton that, in the time of Henry III., it was the practice to summon four knights for every hundred, who elected twelve other knights, or else twelve liberos et legales homines, to take part with them in the inquest. Towards the latter part of the reign of Edward III., in addition to the inquest for the hundred, the sheriff was required to return a panel of knights for the whole county. This jury was called le grandue inquest, and made inquiry for the county, while the jury for the hundred inquired for the province only. After the establishment of the grandue inquest, the practice of summoning a jury of the hundred gradually went out of use; but until 6 Geo. IV. c. 50, it was deemed necessary that some of the grand jury should be summoned for that purpose. In the present day, the grand jury must consist of not less than twelve, or more than twenty-three members. A grand jury is summoned for every assize, and for the quarter-sessions in counties and boroughs. It is not necessary that grand jurors should be freemen, and for grand jurors at assizes, no qualification by estate is necessary. At sessions, the qualification of grand jurors is fixed by 6 Geo. IV. c. 50, and is the same as that of the petit jury. See JURY. Town-councillors of a grand jury unless on an inquest de mediate regnis. In Middlesex, two grand juries are summoned every term, and are sworn before the senior puisne judge of the Queen's Bench. After having the oath administered, and receiving a charge from the judge, they retire to their rooms, and the various indictments, which are called bills, are laid before them. The duty of the grand jury is simply to inquire whether there is sufficient evidence to warrant the proceeding with the charge. For this purpose they may require the same evidence, written and parol, as may be necessary to support the indictment at the trial. But in practice, having ascertained that the crown has a sufficient primo facie case, they return a true bill, the prisoner's evidence being reserved for the trial. Witnesses are sworn on their examination before the grand jury by an officer appointed by the court. When the jury have come to a conclusion, the clerk indorses on the indictment a true bill in case the jury, or a majority of twelve, are satisfied that the case is sufficiently proved. In case they are not satisfied, the indictment is indorsed not a true bill. The foreman, accompanied by one or more of the jurors, then carries the indictments into court, and presents them to the clerk, who states to the court the nature of the charge and the impossession of the jury. A bill having been thrown out by the grand jury, it cannot be preferred to the same grand jury during the same assizes or sessions. The grand jury usually serve for the whole session to which they are summoned; but in an emergency, as where a serious crime has been committed, and the prisoner brought in after the jury has been discharged, it is competent to swear a new jury. It frequently happens at assizes that, an offence having been committed before the grand jury have been discharged, a bill is immediately sent before them, on which it is sworn that the evidence has been disposed of in a few days, or even a few hours, after commission of the offence.

Although, to a certain extent, a preventive of fiscal oppression, the grand jury is found in practice to be a clumsy means of certifying cases for trial, and in point of fact it has degenerated into little better than a sham. As occupying the time of persons in business often for days, it is so very generally disliked, that on this account alone projects for abrogating it have been put forward. In Scotland there is no grand jury; the duty of investigating and bringing to trial in that country being assigned to a public prosecutor. See ADVOCATE, LORD.

GRAND MASTER (Lat. magister major; Ger. Hochmeister), the title of the head of the military orders, the Hospitalers, the Templars, and the Teutonic knights; see these articles. The title originally borne by the superior of the Hospitalers was simply 'master' (magister); but in 1268 High De Revet, after he had been elected grand master, began to style himself -grand master, magister major. In the Teutonic order, the title 'master,' with different modifications, was applied to the several superiors of the order in the various countries. Thus, the superior of Germany was styled Hochmeister, 'German master.' The superior of Livonia was called Heermeister, 'military master.' In all these orders the office of grand master was held for life. The name was also used in the Dominican order.

GRAND PENSIONARY. Formerly the synod of each of the important towns of Holland was termed a Pensionary, and the state-secretary for the province of Holland, a Grand Pensionary. Until the time of Olden Barneveldt (q.v.), the Grand Pensionier was also advocate-general for the same province. He had no vote in the assembly of the states, and could only bring forward the subjects of discussion. He, however, collected the votes, wrote the decrees, read the letters addressed to the states, conducted negotiations with foreign ambassadors, and was the principal officer of the foreign and domestic affairs; besides, he had the revenues of the province, of its rights and privileges, and whatever else pertained to its welfare. He was a perpetual member of the states-general of the United Netherlands, and thus, as first magistrate of the first of the United Provinces, he acquired immense influence over all Holland, and may be considered premier of the Dutch parliament. The Grand Pensionary held his office for five years, but was in most cases re-elected. The office was abolished in 1733, after the conquest of Holland by the French revolutionists.

GRAND RAPIDS, a prosperous manufacturing city, in the state of Michigan, United States, is situated in a pleasant and healthy district on both banks of the Grand River, about 33 miles from Lake Michigan, and 60 miles south-west of Lansing. The river is here about 900 feet wide, and descends 15 feet in the course of one mile, producing abundant water-power. The G. R. is handsomely built, commands a fine view, and is one of the principal manufacturing cities in the state. The vicinity is rich in salt and gypsum, and in limestone, pine-lumber, and other building materials. Pop. (1859), 10,000. The city was first settled in 1833, and incorporated in 1850.

GRAND RIVER, a river of North America, rises and flows throughout its entire course within
GRAND SERJEANTY.—GRANDFATHER.

the state of Michigan, and falls into the lake of that name at the town of Grand Haven (q. v.). Its source is in the West Lake, one of the two main branches which unite near the town of Jackson. G. R. is navigable for large steamers to the rapids, which are 40 miles from the mouth of the river, and for smaller boats for 50 miles further; its whole course is 270 miles.

GRAND SERJEANTY (magna serjeantia, or magnus servitium, great service), was the most honourable of the ancient feudal tenures. According to Lyttleton, tenure by grand serjeancy is where a man holds his lands or tenements of our sovereign lord the king by such services as he ought to do in his proper person to the king, as to carry the banner of the king, or his lance, or to lead his army, or to be his marshal, or to carry his sword before him at his coronation, or his carver, or his butler, or to be one of his chamberlains of the receipt of his exchequer, or to do other like services. This tenure must have been held of the king. Where lands were held of any subject, on condition of performance of services identical with those which were rendered to the king, the tenure was not grand serjeancy, but knight's service. Thus, lands on the Scottish border held of the king by cornage—i.e., on condition of warning a horse to give notice who had crossed the border—were held in grand serjeancy; but lands held of a subject for the same service were held in knight's service. Tenants holding by grand serjeancy were free from escheate, which was the duty of lands held of knight's service, and in general could only be called upon to perform their services un per quattor maria, within the kingdom. The services in grand serjeancy were to be performed by the tenant in person, where he was able to do so. The office of attendance on the sovereign's person was esteemed so honourable, that no one below the dignity of a knight could perform it. Hence, where lands held by grand serjeancy were in the possession of a citizen, he was permitted to perform his service by deputy. The tenure by grand serjeancy was by 12 Charles II. c. 24, in common with other military tenures, reduced to common socage (q. v.), except so far as regards the honorary service, which continues to be observed to this day. Thus, the Duke of Wellington holds of the crown his estate of Stratfield Saye on condition of presenting to the sovereign a flag bearing the national colours on each succeeding anniversary of the battle of Waterloo. The Duke of Marlborough, Woodstock, with the demesne, in which is situated Blenheim Park, is held by the Duke of Marlborough by grand serjeancy, on condition of presenting to the Queen and her heirs, at the castle of Windsor, a standard of France, on the 13th August yearly, being the anniversary of the day on which the battle of Hochstet was fought, near the village of Blenheim, on the banks of the Danube. The tenure of grand serjeancy was observed throughout the continent of Europe. The freewomen Franks,' says Mr Hallam, Mid Ages, 'saw nothing menial in the titles of cupbearer, steward, marshal, or master of the horse, which are still borne by the noblest families in every country in Europe, and by sovereign princes in the empire. The Count of Anjou, under Louis VI., claimed the office of great seneschal of France—i.e., to carry dishes to the king's table on state-days. Thus, the feudal notions of grand serjeancy prepared the way for the constitution of royal supremacy, as the military tenures had impaired it.

In Scotland, grand serjeancy was not known as a separate tenure—that is to say, lands held on condition of honorary services rendered to the sovereign were not attended with any privileges other than those attaching to lands held in a similar manner of a subject superior. In that country, a tenure by honorary service was known as a BLANCH HOLDING.

GRANDEES (Span. grandes), the name by which the most highly privileged class of the nobility of the kingdom of Castile has been known since the 13th century. To this class belonged the whole of that very powerful portion of the nobility who, from the 14th century, were called los Caballeros Hombres by pre-eminence; and to whom, moreover, the crown had granted the right of bearing a banner, and of gathering mercenaries around it on their own account. The members of the royal family were not included amongst the grandes. The honours of the grandes were hereditary; they held lands from the crown on the tenure of military service, being bound to produce a certain number of lances, each lance being represented by a knight with four or five men-at-arms. The grandes were exempted from taxation, and could not be summoned before any civil or criminal judge without a special warrant from the king. They were entitled to make war, to receive a share of a foreign prince at war with Castile without incurring the penalties of treason. Besides these privileges, which were common to them with the rest of the higher nobility, the grandes possessed several which were peculiar to themselves, or which they shared only with the so-called 'Titolados'—the counts and dukes. Of these must especially be mentioned the right in all public transactions of being covered by the presence of the king. The king addressed a grande as mi primo, 'my cousin,' whereas any other member of the higher nobility he called only mi pariente, 'my relative.' In the national assemblies, the grandes sat immediately after the prelates and before the titled nobility (titulados). They had free entrance into the palace, and into the private chambers of the monarch; and on the occasion of religious solemnities, they had their place in the chapel royal next to the altar. Their wives shared their dignities, the queen rising from her seat to greet them. Under Ferdinand and Isabella, Cardinal Ximenes succeeded in breaking the power of the feudal nobility so completely, that by the end of the 16th c. the privileges both of the grandes and of the rest of the higher nobility were almost wholly abolished. Ferdinand's successor, Charles V., who considered it still necessary to bind to his party some of the nobles, had to reward others for the important services which they had rendered him, contrived out of an independent feudal nobility to construct a dependent court nobility. Gradually three classes of grandes arose out of this merely nominal nobility. It was the privilege of the first class to be commanded by the monarch to be covered before they had begun to address him; the second class received this command as soon as they had finished their address, and heard the king's reply with covered head; but to the third class it was addressed only after they had already listened uncovered to the royal reply. All grandes had the title excellency, and sentinels were bound to present arms to them. By the revolution and under the government of the two Bourbons, the dignity and privileges of the grandes were entirely abolished; but they were partially restored at the subsequent restoration, though no very important privileges were bestowed on them. By the constitution of 1834, the first place in the chamber of peers is assigned to the grandes.

GRANDFATHER. A grandfather is not liable at common law in England to maintain
GRANDVILLE—GRANITE.

GRANDVILLE, Jean Ignace Isidore GÉRARD, a French artist and caricaturist, was born at Nancy, 3rd September 1803. In the year 1828, he published the first of a series of humorous sketches, entitled *Les M étamorphoses du J our*, which were highly thought of; and soon afterwards another series, entitled *Les Animaux Portants*. After the July revolution, G., with Decamps and Daumier, became the moving spirit of the *Caricatures*; perfect collections of which are now in great request. *His Concoir de la Liberté*, his *Base Cour*, *Mat de Coconuye*, &c., as pictures of the politics and manners of the times, are of great and lasting value. When the law of September put an end to political caricature, G. used his pencil to satirise the less important follies and vices of mankind. He also contributed illustrations to new and splendid editions of the *Habitations de Lafontaine and Florian*, the *Adventures of Robinson Crowe*, *Gulliver's Travels*, *Abel Hugo's Vie de Napoleon*, Rayban's *Jérôme Patrou*, &c. G. is remarkable for depth and delicacy of observation and criticism, for his ingenious turn of thought, and accuracy in portraiture. His drawing is correct, his anatomy accurate, his foreshortening carefully studied; the whole is occasionally hard and cold, the idea complicated, but always united with rare delicacy of allusion and allusion of symmetrical details. G. died at Paris, 17th March 1847.

GRANE, GRAN, or QUADE, a town and seaport of Arabia, is situated on a bay of the same name at the north-western extremity of the Gulf of Persia, lat. 27° 26' N., long. about 48° E. Its trade is of some importance. Pop. estimated at about 8000.

GRAN'ICUS, the ancient name of a small river in the north-west of Asia Minor, flowing from the northern side of Mount Ida to the Propontis, and now known as the Kukbasu. The G. is celebrated as the scene of the first victory gained by Alexander the Great over the Persians after he crossed the Hellespont, 334 B.C.

GRANITE, a well known igneous rock, composed of the three minerals, quartz, felspar, and mica, united in a confused crystallisation; that is, without a regular arrangement of the crystals. The felspar is the most abundant ingredient, and the proportion of quartz is greater than that of mica. The name has been given to it on account of its granular structure.

Granite differs from greenstone and the later igneous rocks, in the large quantity of quartz that enters into its composition. In the trappean and other igneous rocks, the silica or silicious acid was only sufficient for union with the bases to form felspar and hornblende, the constituents of these rocks, none remained free to crystallise as pure quartz; while in granite, so great was the excess of silica, that in its pure state, as quartz, it forms a considerable bulk of the rock. Granite is always a compact rock, it never passes into or alternates with tuffs or breccias. This peculiarity, associated with the crystalline structure of the rock, and the absence of cells in the Felspars, such as are produced in trappean rock and volcanic rocks by the expansion of the contained gases, have led to the belief that granite has been formed at considerable depths in the earth, and has crystallised slowly under great pressure or pressure from superimposed strata or deep seas. On this account the granite rocks have been called *Plutonic rocks*; and Lyell has applied to them the term *hypogene*, from upon, under, and *ginonai*, to be born. It was formerly supposed that all the granite rocks were formed before the deposition of any of the sedimentary strata, and hence they were named *Primitive rocks*. But it has been found that granite is associated with formations of various ages, and it is known since the beginning of the Tertiary epoch its intrusion among the Eocene strata of Central Europe has raised the Alps more than 10,000 feet above the level of the sea, this name has been entirely dropped. Although granite is not absent from the Secondary and Tertiary strata, it is more frequently associated with the Palaeozoic formations; indeed, it appears to be the fundamental rock of the earth's crust. Wherever we reach the base of the stratified rocks, we find them covering upon granite; and whatever the age of the strata thus lying on the granite, whether Chalk, Siurian, or whatever else, we have no reason to suppose that below the granite there occur beds of older date; for, although granite is rare, the stratiufl rock has not been noticed to spread over them like greenstone, so that wherever it presents itself in a large mass, it is believed that no other rock is beneath it. We are at any point to penetrate through the stratified rock, that form the upper part of the surface of the earth's crust, we would reach at their base a granitic rock; and in our progress still downwards, the only change we would encounter would not be one of materials, but only of the condition of these materials: we may trace from the influence of the pressure there are appearances, however, which seem to indicate that some granites are true, though highly altered, sedimentary rocks.

Large extents of the earth's surface are covered with granites; occasionally, it is the superficial rock in flat undulating plains, but it most frequently makes its appearance in mountainous regions, perhaps forming the axis of the mountain-range, and thus being the cause of its elevation. It is probable that in some cases granite has been raised from below as a solid indurated rock; it has, however, generally been in a fluid condition, as is evidenced by the number of veins which are protruded through the mass into the adjacent strata.

The varieties of granite depend upon the number and quantity of its mineral constituents, and upon the state of aggregation of these materials. Ordinary granite is composed of felspar, mica, and quartz. The felspar may be either the flesh-coloured potash variety, orthoclase, or the pure white soda variety, albite, or both potash and soda may enter into its composition. The mica varies in colour from a pure silvery white, through the more common brown, into black. The quartz is generally white, seldom dark-gray or brown. The predominance of one or other of the ingredients, or of a particular variety, gives the peculiar colour to the mass, which is generally either red, gray, or white.

The red is produced from the predominance of orthoclase; the white, of albite; and the intervening gray from the mica, or sometimes from the quartz. The felspar forms generally a half, and sometimes sometimes even a majority, of the granite rocks; the mica a smaller quantity, and the quartz in another, are so minute as to be scarcely visible. Sometimes the felspar separates into large and distinct crystals forming a porphyritic granite. The substitution of hornblende for mica produces that variety called Syenite (q. v.); and if talc takes the place of the mica, the rock is called *Protagine* (q. v.). When the ingredients exist in a compact and finely granular condition, the compound is known as *Eurite*. Sometimes, especially
in veins, felspar and dark quartz are arranged so as to produce an imperfect laminar structure, which, when broken at right angles to the lamina, presents numerous broken and angular lines that have a faint resemblance to Hebrew characters, whence it is called Graphic Granite.

Granite is largely used as a building material in bridges and engineering-works, and also in public buildings and dwellings. The difficulty of working it is, of course, expensive, but it is counterbalanced by its great durability. It cannot be cut, like the majority of building-stones, with saws, but is worked first with large hammers, and then with pointed chisels. The success with which the Egyptians operated upon this refractory stone is very extraordinary. They worked and polished it in a way which we cannot excel, if, indeed, we can come up to it, with all the appliances of modern science; and not content with polishing, they covered some of the blocks with the most delicate and sharply cut hieroglyphics!

The granites best known for ornamental purposes are the gray Aberdeen granite and the reddish coloured Peterhead granite. Of this last-mentioned variety, handsome polished columns for public halls have been constructed.

The soil produced by the weathering of granitic rocks should be fertile, as their chemical composition contains the necessary elements. The great hardness of the rock, and its resistance to atmospheric influences, prevent a soil of any thickness being formed; and even where it exists, at least in our temperate regions, it is generally so high and exposed, that it is unfavourable to vegetation; in warmer climates, such soils are frequently very fertile.

GRANT, in English law, the conveyance of real property by deed. Originally, the term was confined to the conveyance of incorporeal hereditaments and estates in reversion; according to the maxim that incorporeal property lay in grant, and corporeal property in livery, it being impossible to give actual sasine of that which had no tangible existence, or was not in the possession of the granter. In order to render the conveyance of a reversion or remainder by grant, it was necessary that the tenant of the particular estate should acknowledge the grantee by attornment. The necessity for attornment was abolished by an Act of 31 Geo. III. By sections 8 and 9 Vict. c. 106, it is enacted that estates, corporeal as well as incorporeal, may be conveyed by grant.

GRANTHAM, a municipal and parliamentary borough and market-town of England, in the county of Lincoln, is situated on the left bank of the Witham, 23 miles south-west of the city of Lincoln, and about 110 miles north-west of London. G. has a free grammar-school, with an income from endowment of £900 a year. The parish church, a beautiful structure of the 13th c., has a fine spire 273 feet high. Here Newton was instructed in classics before entering Cambridge. A canal 39 miles long connects this town with the river Trent. The trade is chiefly in malt, corn, and coal. G. returns two members to the imperial parliament. Pop. in 1861, of parliamentary borough, 11,116.

GRANULATIONS, the materials of new texture as first formed in a wound or on an abraded surface. See INFLAMMATION, CICATRIZATION, WOUND, ULCER.

GRANVILLE, a fortified town and seaport of France, in the department of La Manche, is situated on a promontory surrounded by a fort, 23 miles north-east of St Malo. It is a badly built, dirty, and uninteresting town; the extensive new pier, built in a sufficiently strong manner to admit of its being mounted with cannon, and the old parish church of gray granite, built in the flambant style, being almost the only noteworthy features. Its harbour, though well-sheltered and capable of accommodating 90 ships, is always dry at low water. The principal trade of G. is in the whale, cod, and oyster fisheries. Pop. 9984.

GRAPE-SHOT, called also tier-shot, consist of bullets or small iron balls piled round an iron pin, holding together a series of parallel iron plates (each the diameter of the cannon used), between which are the shot, kept in their places by holes in the plates. Small 34-inch or 4-inch shells are also quilted together like grape for firing from mortars at short range, as, for example, in clearing the covert-way of a fortress from the third parallel. In either case, the explosion of the charge bursts the binding, and the shot (or shells) begin to scatter directly on leaving the muzzle of the piece. Grapes are very formidable against dense masses of troops; but, of course, only at comparatively short ranges. The shot employed differ in weight from 6 oz. to 4 lbs., according to the calibre of the gun from which they are fired.

GRAPE-SUGAR. See SUGAR.

GRAPHITE. See BLACK LEAD.

GRAPPILING-IRON, or GRAPNEL, a sort of small anchor, having several pointed claws, used generally in making fast boats and other small vessels. A similar instrument of more formidable dimensions is employed during action for grappling the rigging and yards of a hostile ship preparatory to boarding.

GRAPTOLITES, a group of fossil zoophytes, apparently nearly related to the recent Sertularia. They had simple or branched polypidoms, formed of a horny substance. The cells in which the polype lived were arranged in a single series on one side of the rachis, or in a double series on both sides; the rachis was generally prolonged beyond the cells at the growing end of the polypodium. Egg capsules have been observed attached to the polypidom, exhibiting a method of reproduction similar to that in the hydroid zoophytes. The gene division of the graptolites has been based on the arrangement of the cells.

Nearly eighty species of graptolites have been described. They are confined to the Silurian strata, and are most abundant in the hard slaty shales, which were the fine mud of the Silurian seas.

GRASILITZ, a small town of Bohemia, is situated on the border of Saxony, 20 miles north-northeast of the town of Eger. It has manufactures of cotton goods, paper, looking-glasses, musical and mathematical instruments, and machinery. Pop. 5900.

GRASMERE, the name of a village and lake in Westmorland, about three miles north-west of Ambleside. The village, which is beautifully situated at the head of the lake, has an ancient church, containing Wordsworth’s grave, which is marked by a plain and modestly-fashioned slab. The lake is upwards of a mile long, and about half a mile broad, is oval in form, and encloses a small island. It is girtled about by high mountains, and forms one of the most beautiful scenes in England.

GRASS (in Law). The grass growing on land belongs to the person entitled to the soil, and at his death goes to the heir, and not to the executor. The period of entry as to grass-farms in Scotland is
GRASS CLOTH—GRASSES.

Whitsunday. Where the cattle of strangers are put into the fields of a tenant in Scotland to graze, the landlord cannot sequester the cattle for his rent; whereas, in England, he may distrain the cattle, and pay himself the rent.

GRASS CLOTH, a name often, although erroneously, given to certain beautiful fabrics manufactured in the East from different kinds of fibres, none of which are produced by grasses. One of these fabrics is made from the fibre of Bakumeria nivea, popularly called China-grass; another, also known as Pina Muslin, from the fibre of Bromeia Pigna. See BUERBIA and BROMELIAE. The kinds of cloth really made from the fibre of grasses are extremely coarse.

GRASS OF PARNASSUS (Parnassia), a genus of plants, generally regarded as belonging to the natural order Drosasteres, but referred by Lindley to Hypericæae. The calyx is deeply 5-lobed, there are 5 petals, 5 stamens, and 5 scales fringed with globular-headed threads alternate with the stamens, which are regarded by Lindley as bundles of altered stamens; there are four stigmas, and the fruit is a 1-celled, 4-valved capsule with many seeds. The genus consists of a few small herbaceous plants, with flowers of considerable beauty, growing in wet situations in the colder northern parts of the world. Some of them are found within the arctic circle, and to the snow-line of the Alps, Himalaya, and other mountains. The common Grass of Parnassus (P. palustris) is an ornament of bogs and wet places in Britain and other parts of Europe, with heart-shaped leaves, mostly radical and on long footstalks, and one sessile leaf on the stem, which is about half an inch high, and bears a solitary, yellowish-white flower. It flowers in autumn. It is called Agrostis en to Parnasso by Dioscorides, whence its modern name.

GRASS OIL, a fragrant volatile oil obtained from the leaves and stems of certain grasses of the genus Andropogon (see LEMON GRASS), natives of India. The kind known as Grass-oil of Nemaour is produced at the foot of the Vindhyah Hills, and is exported from Bombay. It has been ascribed to the grass species Andropogon verticillatus, A. nuncientusus, to another species, which Dr. Royle supposes to be the Calamus aromaticus of the ancients; and to a third, also like these, a very fragrant grass (A. Pauarneus). It is not improbable that it may be obtained on the plains of Hindostan. It is obtained by distillation; the grass, being cut when it begins to flower, is bound in small bundles, which are thrown into a boiler with water, and the oil, as it distils over, is received in cold water, from which it is afterwards skimmed. It is of a light straw colour, has a peculiar rich agreeable odour, and is very pungent and stimulating. It is employed in medicine, as a stimulant and diaphoretic, but more frequently as a liniment in chronic rheumatism. Its chief use, however, is in perfumery. It is sometimes called Ginger-grass Oil, but is commonly called Oil of Gerrans by perfumers, and by druggists Oil of Spikenard.—Similar to this, but different, and obtained from other species of the same genus, is the oil known as Oil of Lemon Grass (q.v.).

GRASS TREE (Xanthorrhoea hastata), a genus of plants of the natural order Liliaceæ, natives of Australia, and constituting a very peculiar feature in the vegetation of that part of the world. They have shrubby stems; leaves long and wavy at the summit; somewhat resembling small palms; a long cylindrical spike of densely aggregated flowers shooting up from the centre of the tuft of leaves. The base of the inner leaves of some species is edible, and forms, particularly when roasted, an agreeable article of food. It has a balsamic taste; and all the species abound in a resinous juice, which, on exposure to the air, hardens into a reddish yellow inodorous substance with a shining fracture, sculide in alcohol, and useful as a tonic in dysentery, diarrhoea, and other intestinal maladies; used also by the natives of Australia for uniting the edges of wounds, and with an aluminous earth for canikling their canoes, and as a cement for various purposes. The common grass tree (X. hastata) has a stem about four feet high, but sometimes a foot in diameter. It is of very slow growth, and is supposed to be many centuries old when it has reached such dimensions. Several species are found in Eastern Australia, where their leaves are used as fodder for all kinds of cattle.

GRASSE, a manufacturing town of France, in the department of Var, is pleasantly situated in the midst of flower-gardens, on the southern slope of a hill, 25 miles east-north-east of Draguignan. The streets are steep, narrow, and crooked, but the houses are well built. The principal buildings are the college, hospital, and ecclesiastical school. G. is second only to Paris in its manufactures of essences and perfumes, made from the roses, orange-flowers, heliotrope, mint, &c., which, from the mildness of the climate, are most successfully grown in the vicinity. It has also manufactures of woollen goods, soap, leathers, and olive oil; several silk-spinning factories and tanneries; and a considerable trade in oranges, citron, wax, and honey. Pop. 7292.

GRASSES (Graminées or Graminaceæ), a natural order of endogenous plants, containing almost 4000 known species, about one-twentieth of all known phanerogamous plants; whilst the social habit of many of them, and the vast number of individual plants within even a limited tract, give them a still greater proportion to the whole phanerogamous vegetation of the earth. They are distributed over all parts of the world; some are characteristic of the warmest tropical regions, and some of the vicinity of perpetual snow, but they abound most of all, and particularly in their social character, clothing the ground with verdure, and forming the chief vegetation of meadows and pastures, in the northern temperate zone. There is no kind of soil which is not suitable to some or other of the grasses; and whilst some are peculiar to dry and sterile soils, others are only found on rich soils with
GRASSES.

abundant moisture; some grow in marshes, stagnant waters, or slow streams, some only on the sea-coast; none are truly marine. Some grasses are annual, and some perennial; they have fibrous roots; the root-stock often throws out runners; the stems (culms) are round, jointed, generally hollow, except at the joints, rarely filled with pith, generally annual, and of humble growth, but sometimes perennial and woody, occasionally—as in bamboos—attaining the height and magnitude of trees. The leaves are long and narrow, alternate, and at the base sheath the culm; the sheath is split on the side opposite to that from which the blade springs; and at the junction of the blade and sheath, there is often a short membranous prolongation of the epidermis of the sheath, called the ligule. The flowers are generally hermaphrodite, but sometimes unisexual, and more frequently so in the grasses of tropical than in those of colder climates; they are disposed in spikelets, and these again generally in spikes, racemes, or panicles; they have no proper calyx nor corolla, but consist of the parts of an ideal flower enclosed in two series of small bracts, some or all of which are sometimes awned. See AWN. The two outer

bracts of each spikelet are called glumes. In some grasses, only one glume is properly developed for each spikelet. Within the glumes are the florets forming the spikelet, sometimes only one, but often a larger number, each floret having generally two small bracts called palea or glumelle, the immediate covering of the parts of fructification. The glumes were called the calyx by the older botanists, and the pale the corolla, but inaccurately. The stamens are hypogynous, sometimes only one, sometimes six or more, but very generally three, the anthers attached to the filaments by the middle of their back, and easily moved by the slightest breeze. The ovary is simple, one-celled; the styles two or three, sometimes united; the stigma feathery or hairy. The fruit is a Caryopsis, the pericarp being incorporated with the seed; the seed consists of a small embry, lying at the base and on the outside of a large farinaceous albumen, from which arises in great part to man; the farinaceous seeds of some of the grasses being the corn or grain which forms a chief part of human food. The greater part of this account are noticed in the article CEREALS and in separate articles. Starch is the principal substance entering into the composition of these farinaceous seeds, and is often extracted from them, either to be used by itself as an article of food, or for other economical purposes, according to the kind. Besides starch, they contain, in greater or less proportions, gluten and other similar substances, on which not a little of their nutritive value depends. The peculiarities of composition of the most important grasses are noticed in the article MEAL, or under their separate heads. When, by the process of malting (see MALT), great part of the starch of the grain has been converted into sugar, a fermented liquor is made from it, of which BEER or ALE made from barley is the most familiar example; and from this, again, a spirituous liquor—as whisky—is obtained by distillation. Fermented and spirituous liquors are commonly made in various parts of the world, and in different parts of the world, particularly barley, maize, rice, and millet.—Sucar is another important product of grasses, existing in large quantity in the stems of many species, and particularly abounding in the hard inner parts of some, as sugarcane, maize, and Shaloo or Sugar-grass (Sorghum saccharatum, see DuRRA), from which it is extracted for use. The sugar-cane yields far more sugar than all the other plants cultivated on that account in the world. Rum—also obtained by fermentation and distillation from sugar—is another well-known product of the sugar-cane, and similar liquors may be obtained from the other sugar-producing grasses. Besides these uses, grasses are also of great importance as affording pasture and fodder (larger and smaller) for cattle. See FODDER. The woody stems of the larger grasses are applied to a great variety of economical purposes. See BAMBOO. Those of some of the smaller grasses are much used for thatch, and are also made into plaited mats, litters' bonnets, &c. See STRAW-PLAITING. Under the ground runners of some species, as the Marram Grass and Sea Lyme-grass, make them particularly useful for binding and tying various objects. The stems and leaves of many grasses have fibres of such length and strength that they are twisted into coarse ropes for many purposes in which no great durability is required. Thus, hay and straw ropes are commonly used, and are either set apart from other fibres, or are used in the same way in many parts of the world. Some grasses, as the Moomja (Succharum Munja) of India, are not simply twisted into ropes, but their fibres are first separated by moistening and beating; and the fibres of some, as the Esparto (q. v.) of Spain, are made not only into ropes, but into mats, sacks, and other very coarse fabrics. The Chinese make paper from the young shoots of bamboo; paper is also made from the straw of wheat, barley, and oats, and might be made from that of many grasses. See PAPER. The perennial roots and runners of some grasses contain peculiar substances, on account of which they are used medicinally, as those ofouchgrass. The stems and leaves of some contain Coumarin (q. v.), and have a very agreeable fragrance when dried, as in the case of the Sweet-scented Vernal Grass (Anthoxanthum odoratum) of Britain. A few, chiefly East Indian, obtain other aromatic and fragrant substances in the stem and root, particularly Lemon Grass, Vittieyar, and other species of Andropogon, which yield Grass-oil (q. v.). It has been alleged that the seeds of a few grasses are poisonous, but this in every case requires confirmation, although Darnel (q. v.) in particular has

Fig. 1. a spikelet with one floret; two anthers: b, spikelet with two florets, shown detached from the glumes; three anthers: c, spikelet with many florets; three anthers.

GRASSHOPPER—GRATE.

a bad reputation.—The stems, leaves, and glumes of grasses contain a large proportion of silica, particularly the epidermis, so that when large quantities of them are burned, a sort of glass is formed; a fact which requires attention in questions relative to the manures proper for particular crops, and the most profitable alternation of crops in husbandry. The following are the tribes into which botanists have divided the natural order of Grasses, with the names of some of the most important, as examples:

Oryzae. Rice.
Phalarceae. Maize; Job's Tears (Coix); Canary Grass; Foxtail Grass; Soft Grass; Timothy Grass.
Paniceae. Millet (of various kinds); Pendi; Guinea Grass.
Stipar. Feather Grass; Esparto.
Arundo. Reeds; Marram Grass; Pampas Grass.
Pappophorae. Cord Grass (Spartina); Cynodon; Paspalum.
Aveneae. Oats; Vernal Grass; Alida.
Festucae. Fescue; Meadow Grass; Manna Grass; Teff; Cock's-foot Grass; Tussac Grass; Dog's-tail Grass.
Sub-tribe Bambusina—Bamboos.
Hordeae. Wheat; barley; Rye; Spelt; Rye-grass; Lime Grass.
Rottbelleae. Gama Grass.
Andropogoneae. Sugar-cane; Shaloo or Sugar Grass; Durra; Lemon Grass; Vittieyvar.

The word Grass is probably from the same root as Lat. cresco, Eng. grow.

Among farmers, the term grasses is extended to include, along with the true grasses, other plants cultivated for fodder and forage, such as clover, &c., and these are distinguished by the term Artificial Grasses, whilst the true grasses are called Natural Grasses.

GRASSHOPPER, the English name of many species of insects, forming a family of the order Orthoptera, section Salitoriæ, called Gryllidæ by some (chiefly English) entomologists, and Locustidæ by others—those who adopt the former name designating the Crickets (q. v.) Achetaidæ. Locusta (q. v.), however, do not belong to this family, although very closely allied, but are distinguished from it by greater robustness, shorter legs, and shorter antennæ. The antennæ of the grasshoppers are long and threadlike, as in the crickets. The wings of grasshoppers, as of locusts, fold together like the sides of a roof, whilst those of crickets are horizontal when at rest. Grasshoppers, like crickets and locusts, have the thighs of the hinder legs very large and adapted for leaping. But grasshoppers do not leap with so great energy as locusts, nor are they capable of so sustained a flight. There are, indeed, some of the family in which the wings are merely rudimental, and the eye-crest or wing-covers of small size. Most of them, however, have well-developed wings; and the wing-covers of the males, as in crickets, have a spot at the base of a a tail-like appearance, which together with that of chirping sound is produced which is probably connected with the sexual instincts of the insects, but which we have learned to associate with the brightness of green pastures and of sun-shining days. Grasshoppers are herbivorous. They are numerous in most parts of the world. The largest British species is the Great Green Grasshopper (Gryllus viridissimus, also known as Locusta viridissima and Acrida viridissima), about 1 inch in length, and of a fine green color; a somewhat rare insect in Britain, although not uncommon in some parts of Europe. A green color prevails among the grasshoppers of Britain, and generally of temperate climates, enabling them more readily to elude observation among the herbage in midst of which they live; but some of the tropical species are richly colored, and some have very large wings, almost like those of lepidopterous insects. The greater number of grasshoppers feed on grass and the leaves of herbaceous plants, but some prefer the leaves of trees.

GRA'SSUM, in the Law of Scotland, is a lump sum paid by persons who take a lease of landed property. In the case of entailed estates, the heir in possession is generally prohibited from taking large sums in the form of a grasssum, and letting the property at a lower rent, because it tends to prejudice those who succeed him in the property. In England, the word is not used, but the word premium in some cases, and fine in others, means the same thing. Where a person is entire owner or freeholder, he is entitled to let his land at any rent he pleases, and to stipulate for a grasssum as large as he can get.

GRASSWRACK (Zostera), a genus of plants of the natural order Naiadaceae, one of the few genera of phanerogamous plants which grow amongst sea-weeds at the bottom of the sea. The leaves are narrow and grass-like; and the flowers consist merely of stamens and pistils, without any perianth, inserted on the central nerve of one side of a flat thin linear spatix, with a leafy spathe. The pollen is coniferous.—The Common Grasswrack (Z. marina) is a perennial plant, which forms green meadows on the sandy bottom of shallow parts of all the European seas, and also stands in fresh and salt-water ditches. It is found in great plenty on the British shores. It becomes white by exposure to the air. The rush-like coverings of Italian liquor-flasks are made of it, and it is much used for packing glass bottles and other brittle ware. It has been long used in Holland, Gotland, and Iceland for stuffing pillows and mattresses, and this use has of late years very much extended, so that the plant has become an article of commerce, under the name of Alga marina, or more commonly, but incorrectly, Alea marina (Ger. See-gras).

GRATE, the iron cage which supports the coal for a common fire. Considerable improvements have been made of late years in the construction of common domestic grates. Our forefathers simply added an iron cage to the old form of fireplace built originally for burning a pile of wood. This was a large square-sided recess, with a very wide opening for the chimney. Count Rumford pointed out the disadvantages of this, and the principle on which they should be remedied. See Chimney. In the modern grate, the filling up of the square cavity recommended by Count Rumford, and also his plan of lowering and narrowing the throat of the chimney, are usually effected by iron plates forming part of
GRATIAN.—GRATTIOLA.

the grate. These plates are readily heated, and with equal readiness radiate and reflect the heat into the room, and thereby effect a considerable saving of coal, besides which the grate itself is brought forward with, or even projecting beyond, the walls of the room (which is a hemispherical cavity with bowed bars in front, and a trapped opening into the chimney in the upper part of this cavity. When there is a fair draught, this form of grate gives a good fire, and effects the maximum economy of fuel for an open fireplace (which is of course always somewhat wasteful compared with a stove). The curved surface behind and above the fire radiates and reflects into the room from every part of its surface, and the plate flush with the wall, which is heated by conduction, may be regarded as a part of the room, and thus the main condition of economy is effected, viz., throwing as much as possible of the heat into the room, and allowing as little as possible to go up the chimney; but while the grate is thus moulded to the form of the back of the grate, is useless in retaining the heat which is necessary for complete combustion of coal; the firebrick, being a bad conductor and an excellent radiator, becomes red-hot on its surface next to the coal, and this heat is not carried away, but is radiated into the fire, and assists in burning the carbon of the smoke. The conditions for securing an effective draught are treated under CHIMNEY.

GRATIAN, the collector of the well-known body of canon law which is commonly cited under the title of Decretum Gratiani. It is singular, however, that although few authorities have been so frequently cited, or have obtained so wide and permanent acceptance as this celebrated collection, hardly anything is known of the collector's own personal history. The sum of our knowledge regarding him is, that he was a native of Chiusa in Tuscany, and that he became, in later life, a Benedictine monk of the monastery of St Felix in Bologna. The date commonly assigned to G.'s collection is 1141, bequeathed; or 1151; its title, however, as Decretum, or Concordium Discordantium Canon, is believed to be of later origin. How far the collection is the work of G. himself, or how far he was indebted for his materials, and even for their arrangement, to the masses of earlier collectors, is difficult to determine. The work consists not only of the decrees of councils and popes down to Innocent II. (including the famous Istorian Decretals, q.v.), but also of passages from the Scripture, from the Fathers, and even from the Roman law. It is divided into three parts. The first regards the hierarchical constitution of the church, and chiefly relates to doctrinal and moral subjects. It is divided into ' distinctions. The second treats of external jurisdiction, under the head of ' causes' and ' questions.' The third regards the inner life of the church—the liturgy and the sacraments. From what has been already said regarding his adoption of the Isauriotae, it will be understood that in point of criticism G.'s authority is of little value, and, in general, it may be added that no authority is given to any document beyond what it intrinsically possesses, from the fact of its being placed amongst the collection. For the system of collectors under the title of Gratian's, see CANON LAW. The date of G.'s death is unknown.

GRATIANUS, Augestus, eldest son of Valentinian I, by his first wife Severa, was born at Sirmium in Pannonia, on the 19th of April 359 A.D. While he was still natalinius puer (or heir-apparent), he was created consul, and in 367, was elevated by his father to the rank of Augustus at Ambiani, or Amiens, in Gaul. In the following year, he accompanied his father into Spain, and was appointed to assist against the Alamanni, in order that he might be accustomed to warfare. On the death of Valentinian, the troops elevated G. to the throne giving him at the same time as a colleague his half-brother Valens. II. (or Valens II.) to the crown; but Britain fell to G.'s share; and as his brother was only four years old, G. is supposed by many authorities to have been the monarch de facto of the rest of the Western Empire, fixing his residence at Trier. When he was 12, his brother was set on the throne, and the young Valens was made a tribune of the Liponians, a tribe of the Alemanni. After the invaders had been defeated, G. advanced towards the Eastern Empire, but when he arrived there his uncle Valens had been defeated and killed by the Goths near Adrianople (August 378). The sovereignty of the Eastern Empire then devolved upon G., but feeling his inadequacy to the task of ruling the whole empire, he recalled Theodosius (q.v.) from Spain, and appointed him his colleague on the 19th January 379. G. possessed some admirable virtues: he was pious, chaste, and temperate; his understanding was well cultivated, although not strong, and his eloquence, attractive. But his character was too yielding and plant, and he was consequently often led to the commission of gross acts of cruelty and tyranny, utterly foreign to his nature. His persecution of the pagans, and afterwards of heretical Christians, the first of their kind, was a crime in which his underlings were not only accessory, but are, in a measure, responsible. It requires no censure to say that it was a crime. The advantages which his mind possessed, G. used to the prejudice of his country, and to the devastation of the world. In 383 G. was defeated by the soldiers of the Eastern Empire, and on the 29th August 383 he was slain near Adrianople.
GRATTAN—GRAVEL.

GRATTAN, THE RIGHT HONORABLE HENRY, was born in Dublin 3d July 1746. His father was recorder and M.P. for that city until his death in 1766. The year after that event, having completed his university studies with distinction at Trinity College, Dublin, G. entered as a student of law at the Middle Temple, London, where, however, he neglected the pages of Blackstone, to listen to the living oratory of parliament, and in particular of the orator, Serjeant rheynolds. In 1772, he was elected as one of the representatives of the city of Dublin, to such an extent had his patriotism and eloquence recommended him to the Irish people. Mainly to him was owing, among other things, the partial abolition of the heavy restrictions on Irish commerce. But his popularity ebbed as it had flowed (and oftener than once) in the hearts and huzzas of his impulsive and therefore inconstant countrymen. In 1797, he declined to come forward for Dublin, and went into temporary but undeserved eclipse. In 1800, he was returned for the borough of Wicklow, to oppose the Union, and that was to fight for the people's idea of the constitution. But the union was effected in spite of him, and in 1806 he was returned to the imperial parliament for the borough of Middlesex, which he held at the time of the war. Next year, he was induced to stand for Dublin, and was re-elected. He sat for it in successive parliaments till his death, which happened on 4th June 1820, in London, to which he had gone when in a weak state of health, contrary to the advice of his physicians to advise, as he had been wont, the cause of Catholic emancipation.

G.'s public and private character was unimpeachable. For the vacations of his popularity in Ireland, his countrymen had reason to be ashamed, and it is certain that he now holds a proper and exalted place in the esteem of the people, for whom he laboured with such sincerity, integrity, and genius. The history of his life is in great measure the history of the Irish constitution, and entirely the history of the parliament of Ireland. The history of his Life and Times, in four volumes, has been published by his son.

As an orator, he stands in the first rank. His style is full of piquancy, rapidity, antithesis, and poetical suggestiveness. His oration on Chatham, and his invective against Bonaparte, are not surpassed in British eloquence. Byron declares him to be an orator

With all that Demosthenes wanted, endowed, and his rival or master in all he possessed.

His speeches are collected and published (4 vols. 1821) by his son and biographer.

GRATUITOUS DEED, in the Law of Scotland, means a deed granted without any value received. If it is made in favour of a third party, in order to defeat creditors, it is null and void, by stat. 1621 c. 18. There is this peculiarity, also, that when a person is too generous, and contracts voluntarily to give away property at a future period, if he become destitute in the meantime, the court will, at least where the deed was in favour of children or grandchildren, relieve sufficient for his own subsistence.

This is in imitation of the Roman law to beneficium competente, but the Roman law went further. Such a provision is wholly unknown in England. In England, gratuitous deeds are usually styled Gifts, or Voluntary Conveyances (q. v.), according to circumstances.

GRATZ, the capital of the crown-land of Styria, in Austria, is a picturesque old town, built on both sides of the Mur, and encircled by fine gardens and pleasure-grounds. It is 140 miles south-south-west of Vienna, by the Vienna and Trieste Railway. The population of this inner town, which is connected with the suburb on the western side of the river by two chain and two wooden bridges, is surrounded by walls and by a promenade (formerly the glacis) shaded with trees, but not famous, and is not remarkable for cleanliness. It is worthy of notice, however, from the number of old buildings which it contains, as the cathedral of St Agudl, built in the 14th c.; the ancient castle of the Styrian dukes, which possesses many curious relics of antiquity; the Landhaus, where the nobles of the duchy held their meetings; the university, founded in 1380, with its library containing 50,000 volumes; its museum, &c., the arsenal, and various palaces belonging to the Styrian nobility. G. is well provided with gymnasia and other public educational establishments for the larty, and seminaries for the clergy. As the seat of government for the province, G. has special courts of law and administration, and it is a place of considerable importance. It has important manufactures of steel and iron wares, cotton, linen, and woollen fabrics, leather, paper, saltplatre, &c. From its position on the direct line of the imperial post road to Vienna and Trieste, it is favourably situated as an intermediary station for the trade of the Austrian capital and the Adriatic provinces; and the general amenities of G. have gained for it the witty French designation of 'la ville de Grâces sur la rivière de l'Amour' (la ville de Grätz sur la rivière de la Mer).

GRAUDENZ, an old town and important fortress of Prussia, in the province of West Prussia, stands on the right bank of the Vistula, 60 miles in direct line south of Danzig. A bridge of boats, 2750 feet in length, here crosses the river.

G. contains numerous seminaries and educational establishments. It carries on a trade in corn and tobacco, and manufactures of woollens and cottons, &c. The town is fortified by a wall; and about a mile north of it on a hill, and in a position that commands the course of the Vistula, is the bomb-proof fortress of Graudenz. Pop. 11,136, including a garrison of 1888.

GRAUWACKE. See GREYWACKE.

GRAVE ROBBING. The offence of taking dead bodies has often been attempted to be declared felony by act of parliament; but it is only a misdeemour, punishable by fine and imprisonment. If, however, the shroud, coffin, or any property in the nature of a chattel is taken away from the grave, the party may be indicted for felony in stealing these. See ANATOMY (in Law).

GRAVE STONES. The right to grant or refuse permission to erect grave stones, tombs, or monuments in the church or churchyard, in England, is vested in the ordinary, who is generally the bishop. In Scotland, a similar power is vested in the heritors, i.e., the proprietors of the lands in the parish.

GRAVEL. The name given to aggregations of water-worn and rounded fragments of rocks, varying in size from a pebble to a hen's egg. When the fragments are smaller, the deposit is sand; when larger, gravel. Gravel occurs in formations of every age. While the materials have been a long time in being prepared, and have travelled perhaps a great distance from the mother-rock, gravel deposits have been formed s, coely and by the action of a strong current of water. They
GRAVEL—GRAVITATION, GRAVITY.

form very irregular and limited deposits, occurring generally as banks or hummocks in strata of sand. Unless in the most recent deposits, they almost always form a hard rock called conglomerate or puddingstone, the pebbles being compacted together in some infiltrated current, which, most frequently, ice, lime, or silex. Even so recent as the Glacial period, gravels are sometimes formed into a compact concrete, though these and later deposits are generally of Pleistocene gravels into 'High Level' and 'Low Level Gravels.' The high level gravels are the more ancient; they have been deposited subsequently to the formation of the present valleys, but apparently at a time when there was much more water in the valleys than there is now. The low level gravels have been produced by the present rivers.

GRAVEL. See CALCUS.

GRAVELINES, a small fortified town and sea-port of France, in the department of Nord, is situated in a marshy locality at the mouth of the As. 12 miles south-west of Dunkerque. Although now a desolate-looking town, with grass growing in its streets, it is of importance in a historical point of view. Here the Count d'Égmont obtained a victory over the French army, which was commanded by the Duke of Théroul in 1558; a victory which compelled the French to accept the seven conditions of the peace of Cateau-Cambrésis. Ten years later, it was taken by Louis XIV., who had it fortified by Vauban. The inhabitants are employed chiefly in the herring and cod fisheries, and the trade in liquors, timber, salt-fish, &c. The harbour has now become useless from neglect. Pop., with garrison, about 5000.

GRAVESEND, a market-town, municipal borough, and river-port of England, in the county of Kent, is situated on the right bank of the Thames, 33 miles west-north-west of Canterbury, and 24 miles east-south-east of London by the North Kent Railway. It occupies a somewhat commanding position on the rising ground after entering the river; and consists of the old town, with narrow, inconvenient, and not too cleanly streets, and of the new town, west of the older portion, with handsome streets, squares, and terraces. It is not famous for any architecture. In the vicinity are extensive market-gardens, great part of the produce of which is sent to London. Many of the inhabitants are employed in fishing. G. forms the limit of the port of London. Here pilots direct the coasting vessels and the several boards of vessels going up the river. For centuries, the prosperity of the town has depended on its connection with the metropolis. The salubrious air and beautiful scenery at G. render it a favourite watering-place with Loudonians. It carries on some ship-building and a considerable trade in supplying ships' stores. Population of municipal borough (1861), 18,776.

Graz - originally a Hübe, or landing-place, and is mentioned as such in Domnialy. Around this landing-place a town grew up soon after the Conquest. Here the feasts of the early voyagers, as that of Sebastian Cabot in 1533, and of Martin Frobisher in 1576, used to assemble; and here the lord mayor, aldermen, and city companies were wont to receive all strangers of eminence, and to conduct them up the river in state, forming processions, which, says the historian Froide, were 'spectacles so remarkable for their gorgeousness by the world-famous weddings of the Adriatic.'

GRAVINA, a commercial and industrious episcopal town in the south of Italy, in the province of Terra di Bari, is situated on a hill above the left bank of a stream of the same name, 37 miles, south-west of the town of Bari. It contains 10,949 inhabitants, and occupies the site of ancient Blera, one of the stations on the Via Appia, which passed at Poggio Ursino, about a mile from the town. In 958, it sustained a memorable siege against the Saracens. It was a favourite hunting-residence of the Emperor Frederick II. The neighbourhood possesses rich pastures, and raises a celebrated breed of horses, in which the inhabitants do a large trade at their annual cattle-fair.

GRAVITATION, GRAVITY. All bodies, when raised into the air, and left unsupported, fall to the earth in lines perpendicular to it. The force which causes them to do so is termed gravity, and, universal experience shews, acts towards the earth's centre; more strictly, it acts perpendicularly to the surface of still water. But if a body, as a stone, be projected obliquely into the air, it is made to describe a curve, called its orbit, having it's apex, or vertex, or apogee; and when it meets the earth in its descent, its direction is not towards the centre, but inclined to it at the angle of projection. See PROJECTILES. Observing this, and that the body, if not interrupted in its path, would continue to move in a curve, with its tangent always away from the centre, it is easy to imagine that if not interrupted, it might circulate round the centre as the moon does round the earth. Next, knowing that the force of gravity is exerted at the earth's heights above the earth, the question arises—May it not be exerted as far off as the moon? which we know to be influenced by some force which continually deflects her from the tangent to her orbit, and makes her circulate round the earth. See CENTRAL FORCES. Observing now the time of revolution of the moon, and calculating its Centrifugal Force (q. v.), which we know must equal the centripetal force, we put the question: Is this force the same as gravity? The answer is, that it is a force 3600 times less energetic. If, then, gravity be the force which really holds the moon to her path, it must be explained why it acts upon her so much more feebly than it would, were it applied to a body on the earth's surface. The explanation is given at once if we suppose gravity to be a force whose energy diminishes with increase of distance, and is inversely as the square of the distance from which it is exerted; for the distance of the moon from the earth's centre is just about 60 times that of the earth's surface from its centre, and 3600 : 1 = 60^2 : 1. We infer that it does so from the fact, that there is nothing inadmissible in such a diminution of energy with increase of distance—that, on the contrary, there are many analogies for it, as in the emanations of light and heat; and in the argument drawn from the necessity of otherwise supposing some other force than gravity to be employed in deflecting the moon, and the force of gravity to cease at some unknown level. On these views, and a generalisation to be afterwards mentioned, Newton is understood to have at first rested his law of universal gravitation: 'That a particle of matter in the universe attracts every other particle with a force directly proportioned to the mass of the attracting particle, and inversely to the square of the distance between them—i.e., a law, the truth of which, since it was first broached, has been put beyond all question by the most complete body of predictions, fulfilled to the letter, that can be cited in support of any law of nature.
GRAVITY—GRAY.

Before, however, the argument on the extension of terrestrial gravity to the sphere of the moon could have become pregnant with so great a result, much investigation had to take place in other fields, and, in fact, Newton had, previously to conceiving the law, explained the three great Keplerian laws of order obtaining in the solar system by reference to an attractive force residing in the sun. These laws are—1. That the planets revolve round the sun, the distances of the several planets from the common focus; 2. That every planet moves in such a way that the line drawn from it to the sun sweeps over equal areas in equal times; 3. That the squares of the times occupied by the several planets in their revolutions are to their eccentric distances from their common focus as their times.

From the law of equal areas, Newton inferred that every planet is retained in its orbit by a force of attraction directed towards the centre of the sun; from the orbits being elliptical, he inferred that in each case this force varies in intensity according to the inverse square of the bodies' distance from the sun; while from the third law he inferred the double density of the central force throughout the solar system. It was then, after being familiar with the notion of terrestrial gravity, and its action, through the researches of Galileo, Huyghens, and Hooke, and with the mathematical force acting as the inverse square of the distance of its object, through his explanations of the laws of Kepler, that he put to himself the question: Is not the force with which the moon gravitates to the earth the same with gravity—the force which causes a stone to fall on its surface? A question answered affirmatively on the supposition of gravity, like the sun's attraction, being a force diminishing with increase of distance, and according to the same law. The result was to bring into the whole solar system, the planets, the sun, and satellites and their planets—the satellites being observed to obey the same laws of order with reference to their primaries that the latter obeyed in reference to the sun—under the law of gravitation.

And the imagination lifted up by the grandeur of the conception, would refuse to limit the operation of that law to our own system, were there no facts to entice us to extend it beyond. The phenomena of double stars, however, have themselves justify the extension and the statement of the law as we have given it in universal terms. It may be observed, in conclusion, that the Keplerian laws, which may be said to have been the basis of Newton's researches, are, owing to perturbations caused by the mutual action of the planets, &c., only approximately correct; and that these perturbations afford, when examined, a further proof of the truth and universality of the law of gravitation.

For a notice of speculations as to the nature of the law of gravitation, see Force; see also Falling Bodies, Projectiles, &c.

GRAVITY. SPECIFIC. See Specific Gravity.

GRAY, JOHN EDWARD, a distinguished living naturalist, who for more than thirty years has been connected with the British Museum. Profiting by the advantages which his position has afforded him, he has probably described and classified a larger number of animals than any other naturalist. In 1852, the date of the publication of the Bibliography of Zoology and Geology, by the Ray Society, his papers, memoirs, and books amounted to 455, and we may assume that the number has since then increased. In his works on natural history generally, may be noticed the Zoological Miscellany (1835—1845), which includes descriptions of numerous animals; his Synopsis Zoológica (1829—1835); the contents of the British Museum (1840); and his Gleanings from the Menagerie and Aviary at Knowsley Hall (1846—1850). Amongst his contributions to mammalian zoology, may be mentioned his catalogue of the British Museum, and his 'Description of some New Genera and fifty unrecorded Species of Mammalia;' published in the Annals and Magazine of Natural History. The mammals collected in King's survey of the coasts of South America, from the coast of Ecuador and Peru to those of the Galapagos and Formosa, are described by him. In the list of his memoirs, &c., already referred to, upwards of 100 are devoted to this class. His papers upon birds are comparatively few (twenty), and those on the terrestrial Reptilia, and of the Serpents, were also surpassed by his brother, GEORGE ROBERT GRAY, who superintends this department of the Museum, and who is well known as the author of The Genera of Birds, and of various Museum catalogues of his own. His contributions to ornithology have been extensive, and very valuable, and upwards of 60 of his papers are devoted to the classification of reptiles, to the description of new species, or to the consideration of their economy and habits. On the whole, his memoirs, in 1852, amounted to 119, and many have since been added. In this department, he has been admirably assisted by Mrs Gray, whose Figures of Mollusca and Reptilia are classified and described by his author. More than 70 papers have been devoted to the Articulata (crustacea, insects, &c.) and to the Reptilia (star-fishes, sea-eggs, &c.). He has thus been an active contributor to almost every department of zoology.

GRAY, THOMAS, an English poet, was born in London on the 26th December 1716. His father, Philip Gray, a money-scrivener, was of a disposition so violent, that his wife was obliged to separate from him; and it was mainly through her exertions that her son was placed at Eton, and afterwards at Cambridge. At Eton, he made the acquaintance of Horace Walpole, the son of the prime minister; and when his college education was completed, he accompanied his friend on a tour through France and Italy. After spending a year in the search of the picturesque and in the exploration of picture-galleries, the friends quarrelled, and G. returned to England, and went to Cambridge to take his degree in civil law. At the university, the greater portion of his life was spent, breathing the serene air of noble libraries, and corresponding with friends, as only the men of that day could correspond. In 1756, in consequence of a practical joke, he removed from St Peter's College, to Trinity Hall. He had a just appreciation of the natural beauty of his native country, and rambled in Scotland, Wales, and the English lake counties. He made notes wherever he went, and wrote copious descriptions of what he had seen to his literary friends. He published his Ode to Eton College in 1747, and his Elegy written in a Country Churchyard two years afterwards. His Pindaric Odes appeared in 1757; but however much they might dazzle the
imagination with brilliant imagery, and charm the ear with involved and intricate harmony, they did not touch the popular heart like the *Elegy*. On the death of Colley Cibber, he was offered, but declined, the post of poet-laureate. Shortly after he was appointed Professor of English Literature. Fastidious in his tastes, fond of books and lettered case, indisposed to mingle in the great world, but delighting to comment upon it in letters to friends, blessed with a reputation peculiarly dear to a scholar's heart, comparatively rich, his life glided on inobserved but by one enemy—gout. Dining one day in the college hall, he was severely attacked, and after suffering a week, he died on the 30th July 1771, aged 55 years. He was buried by the side of his mother at Stoke near Eton.

The poetry of G., with the exception of the *Elegy*—which everybody knows—has never become popular; yet in its own sphere it is very perfect; delicately if not richly imaginative, curiously studied with imagery; exquisitely finished, like miniatures painted on ivory. But his subjects are often remote, and out of the track of ordinary human feelings.

GRAY, in Heraldry, signifies a badger.

**GRAYLING** (*Thymallus vulgaris*), a fish of the family Salmonidae, and of a genus distinguished from salmon, trout, &c., by smaller mouth and much smaller teeth, and by the greater size of the dorsal fin. The scales are also much larger. The G. is found in many streams in England, but is, however, very local; and of two rivers in the same neighbourhood, one often contains it, and the other does not. A supposition that it was brought to England by the monks, is unsupported by any evidence. It is found in the Eden and the Esk in Cumberland, in the Clyde in Lanarkshire, and in the Orkney Islands. It is plentiful in many parts of Europe, and equally in Switzerland and in Lapland. It inhabits clear streams, with rocky or gravelly bottoms, and 'seems to require an alternation of stream and pool.' It will live in clean newly made ponds in hard soil, although it does not breed in them, but will remain in those of muddy bottom. Its food consists chiefly of flies and aquatic larvæ, and it is taken by angling in the same manner as the trout. It sometimes attains the weight of four or five pounds. The back and sides are silvery gray.

[Image: Grayling (*Thymallus vulgaris*)]

marked with numerous longitudinal dusky streaks; the dorsal fin is spotted, the spots arranged in lines across the fin. The abdominal line is almost straight, the dorsal line is considerably elevated. The G. is greatly esteemed for the table, but requires to be cooked when newly caught, when it has an odour which has been compared to that of wild thyme. It spawns in April or May, and is in the best condition when trout are out of season, in October and November. There are several other species of *Thymallus*, none of which are British. One of them, *T. anguilla*, a very beautiful fish, inhabiting the clear affluents of the Mackenzie River, is called *Hwéistiknawak*; or the fish *with the winglike fin*, by the Esquimaux. It is said to afford excellent sport to the angler; although the streams in which it is found are visited by few anglers for mere amusement.

This beautiful fish is very local in its distribution, and although hardly found in Scotland, is abundant in most of the Scandinavian rivers. Angling for grayling is excellent sport. It rises to the same flies as those which are used for trout; it also takes worms, maggots, and small larvae and insects. From July till the end of October are the best months for grayling fishing, but in fine open days they afford sport through the winter.

**GRAY'S INN**, one of the four Inns of Court having the sole power of calling persons to the degree of barrister-at-law. See Inns of Court.

**GRAZALEMA**, a small town of Spain, in the province of Cadiz, and situated about 60 miles east-north-east of the city of that name in a strong position on a rocky hill approachable only by a narrow and easily defended ledge, between the Sierras de Ronda on the east, and the Cerro de S. Cristoval on the west. It was compared by the French (a whole division of whom were here repulsed by the inhabitants) to a land Gibraltar. A great deal of smuggling and, to a very small extent, robbery, is carried on by the inhabitants. Pop. 6600.

**GRAZIOSO**, an Italian term in Music, meaning with graceful expression.

**GREASE**, a term of general application to oily or fatty matters, but generally those having some degree of solidity, as tallow. It is more specially applied to fatty matters which are so deteriorated with dirt or other impurities as to be unfit for candle-making and other manufactures requiring some degree of purity in the material. Grease is largely employed as a lubricant for machinery, and especially for the wheels of carriages. The grease employed for the axles of carriages and carts consists of the most inferior kinds of grease mixed with a little tar.

In commerce, the term *Mares Grease* is now well known. It is the fat of horses which are killed in large numbers at Buenos Ayres and Monte Video; and their products, consisting of hides, grease, bone, hair, and impurities, are largely exported to the other countries. Owing to the practice of slaughtering the mares chiefly, this particular kind of fat has been designated *Mares Grease*. It is a very oily fat, and so penetrating that it is difficult to make cakes sufficiently tight to prevent leakage. It is used for lubricating machinery, for which it is well adapted.

**RAILWAY GREASE** is, in reality, a kind of soap, a small portion of soaps being mingled with the materials to effect an imperfect saponification. The object is to prevent the too rapid melting of the material, which, without this precaution, would be excessively rapid, owing to the heat caused by the friction of the wheels revolving with such rapidity. It is also made of very superior materials, and consists generally of the vegetable fats called coconut-nut oil and palm-oil; sometimes animal fat is used. This composition is placed in small metal boxes on the axle, with which they communicate by a small hole, so that, as the axle heats the surrounding parts, the grease in the boxes melts, and runs through the little orifice on to the axle. See HEARST'S GREASE.

**GREAT BASIN**, or FREMONT'S BASIN, a remarkable tract of country in North America, lying in the west of Utah Territory, and bounded on the W. by the Sierra de Nevada, and on the E. by the
GREAT BEAR LAKE—GREAT BRITAIN.

Whistakeh Mountains. It is said to be 500 miles in extent from east to west, and about 350 from north to south; is girdled round on every side by high mountains, while detached groups cross its whole area; and lies at an elevation of about 5,000 feet above sea-level. The Humberhead-Mountain, with an elevation of from 5,000 to 7,000 feet above the surrounding country, traverse the plateau near its centre. This basin contains many lakes and rivers whose waters never reach the ocean, but are carried up by evaporation or are lost in the more arid districts. The G. B. is essentially a desert. Some portions of it are covered by a yielding mass composed of sand, salt, and clay; others by a crust of alkaline and saline substance.

GREAT BEAR LAKE. See Bear Lake, Great.

GREAT BRITAIN. Under this head are noticed—1. The Island of Great Britain—its geology and geography; 2. The United Kingdom of Great Britain and Ireland—its general statistics, &c. Historical sketches of England and Scotland down to the union of the two kingdoms are given under their respective names; the history of Ireland to the union with Great Britain is also given under its own name, together with its geography.

The Island of Great Britain—so called to distinguish it from Britannia Minor, or Little Britain—lies between lat. 49° 87' 30" and 55° 40' 24" N., and between long. 1° 46' E. and 6° 13' W., and is the largest island in Europe. It is bounded on the N. by the Atlantic, on the E. by the North Sea, on the S. by the English Channel, and on the W. by the Atlantic and the Irish Sea, and St George's Channel. The most northerly point is Dunnet Head, in Caithness; the most southerly, Lizard Point, in Cornwall; the most easterly, Lowestoft Ness, in Norfolk; and the most westerly, Ardnamurchan Point, in Argyleshire. Its greatest length is about 608 miles, and its greatest breadth (from Land's End to the east coast of Kent) about 320 miles; while its surface contains about 9,600 square miles.

The geology of G. B. is of peculiar importance. The rocks of the earth's crust having been first systematically studied and expanded here, British geologists have given to the world the names by which the various strata are known, and British rocks form the typical series of the earth's strata. The whole recognised series of stratified deposits occur in Britain, one or two only being more fully developed elsewhere; and it is only in these singular cases that the foreign equivalents are taken as the types. British geology is no less important in the influence it has had in the development of the country. The mineral wealth, especially the coal and the iron, are the real sinews and muscles of Britain's mighty power. No other country has similar advantages in such an area.

We shall, in this sketch of the distribution of the British rocks, follow the order of the strata, beginning with the lowest and oldest. It may be said that the mountainous regions of the north and west are formed of the oldest sedimentary rocks, and that, as we move south-eastwards, we gradually pass over newer strata, until, in the extreme south-west, we come to the only extensive Pleistocene deposits in the country.

The base rocks of the whole series occur in the Outer Hebrides, in Tiree and Coll, and along the western shores of Sutherland and Ross. The true position of these strata has been only recently determined by Murchison and Geikie, who, noticing that their strike was at right angles to the beds resting above them, discovered that they were older of than the superimposed Cambrian rocks. They consider them to be the equivalents of the Lowerian system, described by Sir W. Logan in Canada. The predominant rock is crystalline gneiss. A band of limestone occurs on the north-east shore of Loch Morar, in Mawes, and another, more extensive, and unforeset. The Resting on the convoluted edges of this old gneiss, on the mainland, and forming the basement rocks in Cumberland, Anglesey, and North Wales, we have the Cambrian series of deposits. In Scotland, these strata are mostly unwrought; or are lost in the more arid districts. The G. B. is essentially a desert. Some portions of it are covered by a yielding mass composed of sand, salt, and clay; others by a crust of alkaline and saline substance.

The Silurian strata occupy a large portion of the surface of the country. The typical rocks occur in Wales, extending over the western portion of the principality from Pembroke to Denbigh, and including the northern portions of Pembroke, Caernarthen, and Brecknock, the whole of Radnor and Montgomery, the south-west of Denbigh, and the whole of the counties to the west. The oldest or Lower Silurian beds are next the coast. The next series, the Middle, forms the bedrock of the Highlands, and consists of siltstones, sandstones, and conglomerates; in England and Wales, they are composed of sandstones, gritstones, and slates. A few fossils, chiefly impressions of supposed fucoid plants, annelid tracks, and zoophytes, have been found in the slates.

The Old Red Sandstone strata, consisting of conglomerates, coarse and fine grained sandstones, and dark-coloured schists, with characteristic fossils of ganoid and placoid fish, overlie the Silurians in several districts in Scotland. Nearly all Caithness and the seaward portions of Sutherland, Ross, Cromarty, Inverness, Nairn, and Moray, belong to this series; while, as we go southwards, beginning on the east coast between Stonehaven and St Andrews, stretches across the country to Helensburgh and Dunbarton on the west. The same strata appear again in Haddington, Berwick, and Roxburgh, in Lanark, and in Ayrshire. An extensive tract of these strata occurs in South Wales and the neighboring English counties, extending from the Silurian district to the Severn and the Bristol Channel, and containing in a large basin the South Wales coal-field. The highly fossiliferous strata of North Devon, and of South Devon and Cornwall, belong to this period. They consist
GREAT BRITAIN.

of slates, sandstones, and limestones, and contain numerous corals and shell-fish.

The strata of the Carboniferous period may be said to occupy a broad tract extending from the Bristol Channel to the base of the Cheviots. They are not continuous between these limits, but are broken up in some places by the appearance on the surface of older strata, while in others they are covered by newer deposits. The various detached coal-fields are—(1) the South Wales, in Glamorgan and the Forest of Dean, in Gloucester; (2) the Forest of Wyre, in Worcestershire; (3) Shrewsbury, and (6) Cleebrook Dale, in Shropshire; (7) North and (8) South Staffordshire; (9) Warwickshire; (10) Leicestershire; (11) Flint and Denbigh; (12) Lancashire; (13) York and Derby; (14) Cumberland; and (15) Northumberland and Durham. In the northern portion of this great tract of coal measures, where the millstone grit and carboniferous limestone are largely developed, no seams of coal of any value are contained. The limestone in Derby is rich in metallic ores. The carboniferous strata of the north of England extend beyond the Cheviots into Scotland, forming a narrow band from the Solway to the Firth of Forth. The strata of the Forests of Exeter and Berwick. The only coal-field in this district is one of small extent at Cambus, in Dumfrieshire. The carboniferous strata in Scotland, with the exception just stated, are confined to the immense trough between the Silarian measures on the south and the Old Red Sandstone on the north, which is completely occupied by them, except where the Old Red Sandstone rises to the surface. Considerable tracts of sandstone and limestone without coal break up the true coal-bearing measures into the following coal-fields: the Midlothian, the Fife, the Lanark and Stirling, and the Old Omluck, in Ayrshire. Besides coal, the whole of the Carboniferous series contain immense stores of argillaceous carbonate of iron, the ore from which is produced the great bulk of the iron used in the country. The sandstones of this period form beautiful and durable building-stones, the limestones are used for many purposes. Many of the less indurated shales are good fireclays.

Permain strata, consisting of magnesian limestone and sandstone coloured with oxide of iron, occupy a considerable area in Durham, and border the Carboniferous district of Shropshire and Northumberland. In Westmoreland, Lancashire, Cheshire, Shropshire, Stafford, Worcester, Warwick, Nottingham, and York, and in Glamorgan. The sandstone is quarried for building.

The typical triple series of the Triassic measures occur in Germany; the British representatives consist of variously coloured sandstones and marls. They occupy a considerable surface in Lancashire, Cheshire, Shropshire, and Stafford, and extend as a ribbon of varying breadth, from the mouth of the Dee, through Devon, Somerset, Gloucester, Worcester, Warwick, Leicester, Nottingham, York, and Durham, to the coast at Hartlepool. The only deposits of this age occurr in the Triassic rocks of Cheshire and Worcestershire.

The Lias consists of white sandstones, limestones, shales, marls, and clay-slates. They abound in fossils, especially in the remains of reptiles, fishes, mollusca, and echinoderms. The strata of this age occupy a band between the Trias and the Oolite, extending from Lyme Regis to the mouth of the Tees. Two small tracts of Lias occur, the one in Glamorgan, and the other in Shropshire. In Scotland, small patches exist at Brora in Sutherland, and in the islands of Skye, Eigg, and Mallaig.

The Oolite measures are composed of an extensive series of limestones, sandstones, and shales, which occupy a belt of nearly 30 miles broad, from Yorkshire to Dorsetshire, passing through Lincoln, Northampton, Huntingdon, Bedford, Buckingham, Oxford, and Wilts. The best building materials in England are obtained from these strata. In the Brora Oolite, a seam of coal 3 feet in thickness has been worked for upwards of a century. It is the thickest bed of pure vegetable matter detected in any Secondary formation.

The fresh-water Wenland series, with their abundant remains of reptiles, fishes, shells, and insects, occur in Kent and Sussex, in the Isle of Wight, and in the south of Devon.

The beds of the Cretaceous period, consisting chiefly of chalk with intercalated sands and clays, all very rich in fossil remains, occupy a broad tract to the east of the Oolite strata, and parallel to them. Beginning a little north of Flamborough Head, they may be traced through York and Lincoln, then across the Wash into Norfolk, Suffolk, Hertford, Buckingham, Oxford, Berks, to Hampshire, where they separate into three arms, the one extending south-westward through Wilt and Dorset to the south coast; another taking a more easterly direction to Beachy Head; and the third stretches as a narrow band in an easterly direction through Surrey and North Kent, widening out as it nears the coast, where it occupies the district between Ramsgate and Folkestone.

Eocene strata, consisting of clays, sands, and marls, abounding in fossils which apparently indicate a sub-tropical climate, occupy the valley of the Thames, from Hambledon, to the sea; from Canterbury to Saxmundham, as well as a large district in Dorset, Hants, and Sussex, from Salisbury west to Dorchester, and east almost to Hastings.

Unless the beds in Mull, containing the numerous impressions of leaves of exogenous plants, are Miocene strata, there are no representatives of this period in Britain.

The Pliocene deposits of ferruginous shelly sand and marl known as red clog occur chiefly in the counties of Suffolk. They are composed chiefly of fresh-water sand and gravel, and mammal-like clog, are found on the coasts of Norfolk, Suffolk, Essex, and Kent. The till and glacial beds of the same age are scattered as sub-glacial deposits over large districts in Britain. The deposits of this age occur in Caithness, in the valley of the Clyde, and in Lancashire; they contain remains of mollusca, many of which still live in the seas of boreal America.

Minerals—Coal. There were 2936 collieries in Britain in 1860; from these were raised 83,923,273 tons of coal. The greatly increasing consumption of coal has originated fears as to the possibility of the exhaustion of our mineral fuel. It appears that, while in 1820, only 15,000,000 tons were raised, in 1840, the amount had reached 30,000,000, and in 1860, it was nearly 84,000,000. At the same rate of increase, the known coal, within a workable distance of the surface, would last at least 100 years. But the consumption, during the last 20 years of the century, would, at the present increasing ratio, amount to 1464 million tons a year, a quantity vastly greater than can possibly be used. We need not, therefore, now begin to fear lest our coal-fields should speedily be used up.

Iron. Formerly, the only iron produced in the country was obtained from the greensand of the south-east of England, and from the brown ham- titate of the Dean Forest. The ore was smelted with charcoal. But the introduction of coke and coal for smelting, and the discovery of numerous
GREAT BRITAIN.

additional and unthought-of deposits, especially in connection with coal-bearing strata, has immensely increased the production of iron, and met the greatly increased demands for this important metal. In 1769, when charcoal alone was used for smelting, not more than 25,000 tons of iron were produced; while in 1860, no less than 3,826,572 tons were obtained from 8,624,266 tons of ore. The market value of the metal was £2,757,435. The most important ore is the ferruginous shale, or impure argillaceous carbonate of iron, which occurs in connection with every coal-field in Britain. The brown and red hematite, associated with the oldest Paleozoic rocks, yield also a large amount of metallic iron.

Tin is obtained from only two counties—Cornwall and Devon. In 1860, the 143 mines produced 10,460 tons of metallic tin, worth £748,827.

Copper is principally obtained from the same two counties. There are about 160 different mines, which produced, in 1860, 180,883 tons of ore, yielding 11,579 tons of metallic copper, worth £2,760,438. Besides this, there was a yield of 13,752 tons of copper, produced from iron mines, from the counties of Lancaster, Carlarmeneth, and Anglesey, very small quantities being supplied from mines in Cumberland, Chester, Cardigan, and the Isle of Man.

Lead and Silver are obtained from the same ore from numerous mines in Palaeozoic districts all over the country. The most productive English mines are in Northumberland, Durham, Cumberland, York, and Derby, in Staffordshire, and in Cornwall and Devon. Small quantities are obtained in Somerset, Westmoreland, Stafford, and Chester. All the Silurian counties of Wales contain mines. The Isle of Man yields nearly 3000 tons of ore. In Scotland, the most productive mines are at Wanlockhead and Leadhills; but the counties of Argyll, Perth, and Kirkcudbright also supply small quantities. The total amount of ore raised in 1860 was 86,648 tons, yielding 61,962 tons of metal, worth £1,382,541.

From this ore were obtained 353,553 ounces of silver, worth £142,222.

Zinc is obtained from Cornwall and Devon, Cardigan and North Wales, Derby, Cumberland, and the Isle of Man. The produce in 1860 was 14,972 tons of ore, valued at £130,471. The metallic zinc obtained from this would amount to about 500 tons.

Saltpetre (iridium pyrites) were raised in different parts of Cornwall, to the extent, in 1860, of 36,410 tons, worth £25,584.

Small quantities of the following minerals are also raised in Cornwall, viz., arsenic, manganese, gossan, nickel, silver-copper, floor-spar, and wolfram.

Salt occurs in Cheshire and Worcestershire: no less than 1,502,629 tons were produced in 1860.

It is estimated that the whole mineral produce of G. B., including stones, and pottery, and brick-clays, amounted in 1860 to £45,000,000.

Physical Geography.—The physical features of a country are intimately connected with its geological structure. The older Paleozoic rocks produce mountainous regions, intersected with deep and narrow valleys. The newer strata seldom rise to a great height, though lands and islands undulations of the strata, except where igneous rocks are intruded, and the valleys are broad and shallow. In Scotland, we have, consequently, two extensive mountainous districts, occupied chiefly with rocks of Silurian age, and an intervening valley filled up with Old Red Sandstone and Carboniferous measures. The northern mountain region is intersected by the Great Glen, which is a fissured antecinal axis in the Silurian strata. It is difficult to group the mountains in this district. The Grampians from Aberdeen to Argyle shew the most marked linear arrangement; the greatest eminence in this range is Ben Lussaer (3955 feet). Between the Grampians and the Great Glen a succession of great eminences occur, the highest of which, and the culminating point of the whole British Isles, is Ben Nevis (4046 feet). To the north of the valley of the Caledonian Canal, the mountains, rising to 1400 feet, culminating in Ben Atlow a height of 4000 feet. Cattiness consists of plains of undulating sandstone, covered with drift; the headlands and sea-cliffs in this county are bold and striking. The coast-line of the large western region of the north of Scotland is repeatedly broken by numerous and large friths or sea-lobas, and the interior abounds in picturesque lakes. The Silurians of the south of Scotland form an extensive mountain range crossing the island from St Abl's Head to Stranraer. The rocks are less indurated than in the north, and the scenery is consequently not so wild. The mountains have generally broad flattened forms, intersected by deep pastoral glens, which widen out into broader valleys and dales. The Caledonian height of the New Forest (2790 feet) and Black Larg (2960 feet). The great central valley of Scotland embraces the basins of the Clyde, Forth, and Tay. It consists several tracts of hills, forming a rounded basin, and is frequently broken through by igneous rocks, chiefly trap, which project into bold and picturesque hills.

England and Wales, in the Cambrian and Silurian districts, have the same mountainous character as the similar districts in Scotland; but as much of England is occupied with newer strata, it may be considered on the whole as a level country, traversed by ridges of varying elevation, which form the water-sheds of the country. The range, which begins towards the south, culminates in a high mountainous district, from the borders of Scotland southwards, as the Pennine range, through Northumberland, Cumberland, Westmoreland, Lancashire, and Yorkshire, to the middle of Derbyshire; it varies in height from 1200 to 3000 feet, reaching its culminating point in Croasfell, Cumberland, which is 3383 feet high. The band of Lias and Oolite, extending from Yorkshire to Dorset, forms a tortuous range of table-land, rising sometimes into hills to the height of 1500 feet, and generally a bold escarpment to the west, and having a gentle slope to the east. To the west of this range of table-land are the valleys of the Yorkshire Ouse and Derwent, and the eastern part of the east, the Great Ouse and the upper portion of the Thames. Beyond these two rivers, the country rises into a range of low chalk-hills, which follow the cretaceous strata from Norfolk to Wiltz, dividing with the strata into three ranges, two of which take an easterly direction through Sussex and Surrey and Kent, bordering the Wealden strata, and forming the South and North Downs. Devon and Cornwall are mountainous, from the intrusion of granites and other igneous rocks through the Palaeozoic strata.

The details of the physical geography are given under the names of the several counties, lakes, rivers, &c.
more than three degrees; and for the remaining six months it ordinarily ranges between 36°0 and 48°0. Since the Reports of the Registrar-general clearly state the average temperature of the coasts of England, in the Isle of Wight, is between 50°0 and 60°0, it follows that, as far as concerns temperature, the climate of G. B. is one of the healthiest in the world.

As appears from data furnished by the Reports of the British and Scottish Meteorological Societies, the mean temperature of England is 49°3, and of Scotland 47°5. The mean temperatures of the following places, arranged according to the latitude, have been derived from the same sources: Guernsey, 50°2; Truro, 51°1; St. Vincet, 51°5; Barnstaple, 50°8; Aldershott, 49°4; Greenwich, 49°5; Bedford, 49°3; Derby, 48°8; Liverpool, 48°9; Manchester, 48°6; Isle of Man, 47°8; Scarborough, 47°0; Milne-Graden (Berkwick), 46°8; Dalkeith, 46°9; Rothsay, 47°8; Greenock, 47°9; Arbroath, 46°6; Culden, 46°8; Tongue, 46°5; Sandwick (Orkney), 45°6; and Bressay (Shetland), 45°3. There is thus a difference of fully six degrees between Ventnor in the Isle of Wight, and Shetland. As this difference is chiefly attributable to the difference of their latitudes, it follows, that it will become greater as the force of the sun's rays increases; and hence, while the winter temperatures are corresponding, the summer temperatures are 61°8 and 53°4. A regular decrease of temperature, with an increase of latitude, will be observed, particularly if the places on the west side of the island be regarded as a distinct series by themselves. It will appear, on examination, that the temperatures of places on the west are about a degree in excess of those of places in the same latitudes, but at some distance from the Atlantic. In winter, the differences between the west and the other parts of Scotland are very remarkable: the temperature of the coast temperatures are 59°5; that of Greenwich is 37°9; Nottingham, 37°3; York, 37°1; Scarborough, 38°5; Dalkeith, 37°0; Arbroath, 37°1; and Culdees, 38°2.

The south-west winds are the most prevalent throughout the country, and cannot be considered as adding any new ethno-linguistic element; so that the inhabitants of England (excepting Wales) and of the Lowlands of Scotland may be considered as sprung from an amalgamation of the original Celtic with German and Scandinavian blood, the latter having their greatest frequency—being, as compared with the north-east, in the proportion of two to one—that the salubrity of the climate in a great measure depends.

In these districts of England where hills do not interfere, the annual rainfall is about 25 inches, and in similar parts of Scotland about 28 inches; but these amounts, which may be considered as the minimum falls, are variously increased by proximity to hills, according as the place is situated in the east or west of the island, viewed in relation to the direction of the wind which brings the rain, and by its lying to the wind or lee side of these hills. Since it is the south-west winds which bring the heaviest rains, the heaviest falls take place among the hills in the west of the country; and it may be here observed that, in the west, where there are few hills lying to the north-west, west, or south-west, the annual rainfall is about the minimum. The annual rainfall in Cornwall, Wales, Cumberland, and the West Highlands, may be estimated at from 45 to 65 inches. In some places, however, this amount is far exceeded. At Bathwater, in Cumberland, for instance, the rainfall is truly tropical, the mean annual amount being 127 inches; in 1861, it was 182 inches; and in the month of November of that year the enormous quantity of 3841 inches fell at this station. At Tyndrum, in Argyllshire, 1345 inches fell in a single year, due to the position of the place, and among the Arrochar Hills, the monthly rainfall is occasionally between 20 and 30 inches.

Natural History.—The natural history of G. B. corresponds generally with that of continental Europe (q.v.). The very rich species of plants or animals, peculiar to Great Britain. The flora of the greater part of the island most nearly resembles that of Germany; but in the south of England there is, as might be expected, a closer correspondence with that of the north of France; and some plants found in the Channel Islands and on the French coast appear nowhere in France but in the south-west of England. The mountains of Wales, Cumberland, and Scotland have a vegetation resembling that of Scandinavia more than that of the mountains of Central or Southern Europe. The state of the case is much the same as to the fauna. There are, however, many remarkable instances of both of these cases. Some plants and animals, which, from these apparent relations to continental Europe, might be expected in G. B., and which are not indigenous to it. As examples, may be added, among plants, the Norway spruce, the larch, and the linden, and among animals, the elk, so abundant in Scandinavia. The progress of civilisation and of cultivation has completely banished from G. B. many of the animals which were once numerous, as bears, wolves, &c. But on the contrary, many plants which were formerly introduced by man, have become thoroughly naturalised.

Ethnology.—The present population of the island of G. B. is the result of successive waves of immigration and conquest. When the Romans invaded Britain (54 B.C.), they numbered about 500,000 souls, and they continued to be essentially so until the 5th and 6th centuries, when—the Romans having previously retired—the level parts of the country were gradually overrun and subdued by German tribes from the opposite coasts. Then followed invasions of Danes and other Scandinavian nations, and lastly the Norman Conquest. As the Normans, however, were originally from Scandinavia, they did not introduce any new ethno-linguistic element; so that the inhabitants of England (excepting Wales) and of the Lowlands of Scotland may be considered as sprung from an amalgamation of the original Celtic with German and Scandinavian blood, the latter having their greatest frequency—being, as compared with the north-east, in the proportion of two to one—that the salubrity of the climate in a great measure depends.

Notwithstanding the union of the two kingdoms into which the island was once divided, the distinction, for certain purposes, is still kept up. England (including Wales), the larger and southern division, extends as far north as the parallel of 53°48', the southern shore forming the broad base, and its east and west coasts gradually approaching until the apex is reached at Berwick-on-Tweed. Scotland occupies the northern part of the island; its greatest length (from Mull of Galloway to Durnet Head) is about 297 miles; its greatest

185
breath (from Peterhead to Ardnamurchan Point) about 182 miles; elsewhere, however, the breadth is much less. Between Alloa, on the Forth, and Dunoon, on the Clyde, it is only 23 miles between the head of Loch Broom, on the west coast, and of Dornoch Firth, on the east, only 26 miles; and north of Inverness, the average breadth does not exceed 70 miles. The entire area is about 31,300 square miles. The greater part of the surface of Scotland is irregularly distributed into mountain and valley, a very small proportion spreading into level plains. The eastern coast forms a waving, continuous, and rarely broken line; but the western is extremely irregular, being deeply indented with bays and arms of the sea, and exhibiting steep promontories and mountainous islands. The whole country is physically divided into Highlands and Lowlands. The former comprises the north-west, west, and central portions; the latter, generally speaking, the east coast, and the country south of the Firth and Clyde.

Islands.—The island of G. B. is surrounded by the Isle of Man, Anglesey, the Scilly Isles, the Isle of Wight, the outlying Channel Islands, the Shetland Isles, the Orkneys, and the Hebrides, each having generally a mainland encircled by smaller islands and rocks. A great number of these, covered with sea-fowls, inhabit fishermen in their boats visit, and shepherds sometimes dwell in during summer. The coast against the North Sea has few islands, except Tantie, Sheppy, and some loughs, which are isolated at high water. Coghet, Staples, Holy Island, May Island, Inchkeith, and Inchcolm, are the only ones inhabited. The Orkneys and the Shetlands lie to the north. St. Michael, Loos, and the Isle of Wight, are the only islands on the south coast, excepting one sometimes connected with the land, and the Channel Islands off the coast of Normandy. All the other islands lie on the west coast, extending from the Scilly Isles, through Anglesey and Man, to the Island of Lundy; according to the census of 1851, there were about 500 of these islands and rocks, of which only 175 were inhabited; but in 1861 a more careful enumeration was made, when it was ascertained that Scotland alone had 787, of which 186 were inhabited. The returns for England have not yet been published.

For administrative purposes, G. B. with its surrounding islands (excepting the Channel Islands and the Isle of Man), is divided into counties (exhibiting under peculiar jurisdiction), is divided into 84 counties or shires. The following tables exhibit their several areas and populations:

The United Kingdom of Great Britain and Ireland
GREAT BRITAIN.

IRELAND is, since the union of Ireland, the full official designation of the country more generally known as Great Britain, or the United Kingdom. It includes the two large islands of Great Britain and Ireland, and the adjacent smaller islands, together with the Channel Islands and the Isle of Man. In addition to the home-territories comprising the kingdom, G. B. possesses a multitude of dependencies, some of them of vast extent, scattered over every part of the globe, and constituting 'an empire on which the sun never sets.'

The following table exhibits the extent, population, &c., of the several constituent parts of this empire, according to the latest available accounts:

</table>
GREAT BRITAIN.

Most of the subjects which would enter into a complete account of the United Kingdom are treated under separate heads. We can only afford space here for the following brief indications of a general kind:

Agriculture.—The soil of G. B. is almost exclusively devoted to the production of the two primary necessaries of society—bread-stuffs (chiefly wheat, barley, and oats), and grass, roots, &c., as food for domestic animals. For this purpose both the soil and the climate are admirably suited. It is much to be regretted that with regard to the southern part of the island no agricultural statistics have ever been obtained, so that the amount and value of the products can only be guessed at. M'Culloch estimated the number of acres in England under grain crops in 1832–1833 at 63 millions (wheat, 3 millions; barley, 1; oats and rye, 2; beans and peas, 1), and the total produce at 273 million quarters—value, £177,000,000. The produce of potatoes, turnips, rape, and clover, is estimated at £26,000,000. The annual value of the pastures and meadow-hay is immense. The Highland and Agricultural Society of Scotland began in 1856 to collect careful statistics of that part of the island; but owing to a misunderstanding with the Treasury, the undertaking was not continued beyond 1857. In that year there were 3,550,672 acres under rotation, the chief crops being grass and hay, 1,459,805 acres; oats, 938,613 acres, yielding 32,750,763 bushels; wheat, 223,122, yielding 6,154,986 bushels; barley, 198,367, yielding 6,564,429 bushels; turnips, 476,601 acres, yielding 6,690,419 tons; potatoes, 139,819 acres, yielding 430,486 tons. The total number of live-stock in Scotland in 1857 amounted to 6,889,308—viz., 1,834,400 cows, 77,437 cattle, 5,883,158 sheep, and 146,354 swine (see also IRELAND). The amount of corn and cattle raised in the United Kingdom, however, is not nearly equal to the consumption of the population. The average importation of grain during the last fifteen years amounted to 10,100,000 quarters. Butter to the value of £4,902,394, and cheese to the value of £1,636,799, was imported in 1861. Of cattle for consumption there were imported from foreign countries in 1861, 184,560; sheep and lambs, 221,219; and swine, 24,492—the value being £2,117,560. The farm capital employed in the United Kingdom has been estimated in a widely different manner by various authorities.

Manufactures.—The following table exhibits the condition of the textile manufactures:

The number of paper-mills in the United Kingdom in 1860 was 384, of which number 306 were in England and Wales, 52 in Scotland, and 26 in Ireland. The quantity of paper manufactured was—England and Wales, 166,730,300 lbs.; Scotland, 47,520,910 lbs.; Ireland, 9,314,596 lbs.

For other great branches of Industry, see IRON, POTTERY, &c.

Imports and Exports.—The following table exhibits the value of the imports and exports for the five years ending 1861:

The foreign merchandise transhipped from British ports in 1861 amounted in value to £4,419,762; and the computed real value of foreign and colonial merchandise exported from the United Kingdom amounted to £55,604,297. Coffee, cotton, indigo, rice, silk, tea, tobacco, and wool were the largest items in this total.

Gold and Silver Bullion and Specie.—The computed real value of the gold and silver bullion and specie brought into the United Kingdom in 1838 was £29,493,190; in 1859, £37,670,156; in 1860, £22,978,196; and in 1861, £18,747,474. Of this quantity, Australia sent by far the most—viz., in 1858, 49,066,299; in 1859, 48,072,584; in 1860, 67,199,587; and in 1861, 65,331,299. Mexico, South America, and the West Indies were the next largest exporters, then the United States and France. The exports from the United Kingdom during the same period were—1838, £18,028,876; 1859, £33,688,803; 1860, £29,554,700; 1861, £20,811,045.

Coinage.—The amount of gold coined at the royal Mint in 1861 was £8,190,170; silver, £2,000,484; copper, £274,624, giving a total of £8,474,793.

Shipping.—To carry on this vast trade, G. B. had, in 1861 (exclusive of river-steamers), 19,768 registered sailing-vessels, with an aggregate tonnage of 9,913,511 tons, and 978 steamers, carrying 441,184 tons, making together 21,395 vessels, of 4,330,095 tons burden, and employing, exclusive of masters, 172,937 seamen. During the same year, there were built and registered in the United Kingdom 1186 vessels, 215 of them steam, of an aggregate burden of 310,000 tons. The total tonnage of vessels entering and clearing British ports in 1861 was 28,355,885 tons, 21,293,193 tons registering cargoes, the rest being in ballast. The coast-trade of G. B. during the same year amounted to 17,355,233 tons, all but 93,000 tons being carried by British ships.

Railways.—The total length of lines open for
traffic in the United Kingdom in 1860 was 10,433 miles. During the year, 163,435,678 passengers travelled, of whom 20,625,531 were first class, 40,041,914 second class, and 53,798,013 third class. The amount of money derived from these travellers was—first class, £4,170,955; second class, £3,961,742; third class, £4,628,487. Luggage, mails, &c., brought up the receipts from passenger-traffic to £1,083,756. The goods-traffic in the same year amounted to £41,680,066, making a total income of £57,766,999. The total amount invested in railways and by shares and loans in 1858 was £325,375,507, on which was paid interest to the total amount of £6,653,166. The average rate of dividend on the ordinary share capital over the whole kingdom in 1858 was 3½ per cent.; the proportion per cent. of expenditure to total receipts in 1861 was 47. In 1860, the rolling stock of the various companies consisted of 880 locomotives, 10,076 carriages of all kinds, and 180,674 carriages.

Revenue and Expenditure.—The following table shows the revenue and expenditure of the United Kingdom during the last fifteen years, also the surplus or deficiency of revenue:

These figures do not represent the total amount raised for state purposes—to find that out, the amount paid for collection of the revenue must be added, which is about 41 millions, and also some other items.

The income of the United Kingdom is derived from the sources of customs, excise, stamps, taxes, property and income tax, post-office, crown lands, &c. The following are the sums (after deducting payments for collection of revenue) received by the Exchequer in 1861 from the chief of these sources: Customs, £22,785,328; excise, £1,153,596; stamps, £43,367,257; taxes, £292,378; property and income tax, £52,397,759; post-office, £4,151,669; crown lands, £4,383,791; old stores, &c., £4,319,516. The following are the great items of expenditure in the same year: National debt, funded and unfunded, £26,014,149; civil list, and civil charges of all kinds, £11,712,431; army, including ordnance, £15,709,296; navy, £12,608,445.

National Debt.—At the end of the financial year 1861, the national debt of Great Britain and Ireland amounted to £709,494,807, of which £781,430,007 was funded, and £1,059,800 was unfunded. See DEBT, NATIONAL.

Army and Navy.—See BRITISH ARMY; and NAVY, BRITISH.

Form of Government.—The government of G. B. is of the kind known as a 'Constitutional Monarchy,' in which the sovereign accepts of his dignity under an express agreement to abide by certain prescribed conditions. See CROWN, OATH. The sovereignty is hereditary in the family of Brunswick, now on the throne, and in the person of either a male or a female. The sovereign (king or queen) is the directing power in the executive of government; while the legislative function is exercised by parliament. Further information regarding the British Constitution and Laws will be found under the heads PARLIAMENT; MINISTRY; COMMON LAW, COURTS OF; JUDGES, &c.

Money, Weights, and Measures. See FOUND; MINT; WEIGHTS AND MEASURES.

Religion.—The United Kingdom is a Protestant state, but all religions—not offensive to public or private morals—may be professed, and their different forms of worship practised, without interference from any quarter whatever. There are two churches 'established' by special acts of the legislature. In England and Ireland, the established church is Episcopal in its government, and called the 'United Church of England and Ireland' (q. v.). In Scotland, on the other hand, the established church is Presbyterian. See SCOTLAND, CHURCH OF. According to the census returns of 1851 (in the census of 1861 religious statistics were not included), the number of places of worship, together with the sitting-rooms provided, in England and Wales, and the estimated number of attendants on a particular day, were as follows:

Education—England.—In England, the chief institutions for education are the ancient national universities of Oxford and Cambridge; the most recent institutions of London, Durham, and Lampeter in Wales; the classical schools of Eton, Westminster, Winchester, Harrow, Charter-house, and Rugby; the various military schools; the colleges of the dissenting denominations; the middle-class schools, either started by individual teachers, and hence called 'adventure' schools, or by associated bodies acting as directors, to whom the teachers are responsible for the order of instruction, or the various elementary schools and training colleges in connection with the different religious denominations. The number of day-schools in England and Wales in 1851 was 46,042, of which 15,518 were public—i.e., schools deriving a portion of their income from some source besides the scholars, and 30,524 private—i.e., sustained entirely by the payments of scholars. The total number of scholars was 2,144,378, of whom 1,432,982 attended the public, and 721,396 the private schools. As the population then amounted to 17,927,609, this gives a proportion of 1 scholar to every 8½ of the inhabitants. The education statistics of England for 1861 have not yet been published.

Scotland.—Scotland possesses four universities for the higher branches of education—viz., those of Edinburgh, Glasgow, St Andrews, and Aberdeen, besides a variety of minor colleges connected with the Episcopalian Free Church, and other non-established churches; a complete system of parish schools (see National Education); grammar schools or academies in the chief towns, which serve as preparatory gymnasia for the universities, and a large number of 'denominational schools.' In 1851, the number of day-schools was 5,242, of which 3,349 were public, and 1,893 private. The number of scholars was 208,517, of whom 289,045 belonged to the public, and 88,472 to the private schools. Out of a population of 2,888,742, this gives a percentage of 12.7½, or 1 scholar to every 7½ of the inhabitants. According to the education statistics of 1851, the number of children from 5 to 15 years of age, attending school in Scotland, were 441,166, which, out of a population of 3,061,251, gives 1 scholar to every 6½ of the inhabitants.

History.—On the 1st of May 1707, during the reign of Queen Anne, the union of England and Scotland was formally accomplished. In the latter of these countries, the terms at first excited the utmost dissatisfaction, and even indignation; but the progress of time has shown it to be one of the greatest blessings that either nation could have experienced. The last years of Queen Anne's reign were marked by the triumph of the Tory party, headed by Harley and St John (Oxford and Boling-broke), who kept up a constant intrigue with the Pretender, for the purpose of procuring his restoration. This treachery was defeated by the sudden death of her majesty in 1713. According to the Act of Settlement, she was succeeded by the Elector of Hanover, who took the title of George I. The Whigs now regained their ascendency, and, under the guidance of Walpole (q.v.), now rising to eminence, at once proceeded to impeach the more important of the Tory leaders. Other severities drove the more impatient of that party to attempt bringing in the Pretender by force of arms. In 1715, the Earl of Mar in Scotland, and the Earl of Derwentwater in England, raised the standard of rebellion; but both efforts, however, proved abortive, and were speedily crushed. Five years later, occurred the frightful catastrophe known as the South Sea Bubble, when the nation was saved from anarchy mainly by the exertions of Walpole. The latter now became premier and chancellor of the exchequer, and under him the commerce and manufactures of England continued steadily to advance, though little improvement was as yet perceptible either in Scotland or Ireland. George I died in 1727, and was succeeded by his son, George II. An attempt was again made by the Tories to oust the Whigs from power, but was frustrated by Walpole, who still continued the prime mover of public affairs. In 1739, after a peace of extraordinary duration, he was forced by popular clamour into a war with Spain, on account of some efforts made by that country to check an illicit trade carried on by British merchants in its American colonies. This war was feebly carried on, and ingloriously terminated; but the attention of England was speedily directed towards the Austrian War of Succession, in which it was involved through the anxiety of the king for his Hanoverian possessions, and the strong antipathy of the people to the French. Walpole, disapproving of the war, was driven from office in 1743. George II appeared on the field of battle himself, and at Dettingen proved himself a man of courage and spirit. But the success of the French at Fontenoy in 1745 paralyzed the efforts of England during the rest of the campaign; and in 1748, after nine years'
fighting, a peace was concluded at Aix-la-Chapelle, by which it was agreed that both nations should mutually restore their conquests, and go back to exactly the same condition as they were in before the war. This peace had been made (1745-1746) by Prince Charles Edward Stuart to win back the throne of his ancestors. This attempt, known as the second rebellion, was crushed at Culloden (April 16, 1746), and shortly after the accession of James to the throne of Scotland, the ministry was dissolved, and Pitt was called in at the head of a government supported by the imperial parliament relating to Scotland generally, and to the Highlands in particular, which had the effect, on the white, both of conciliating the inhabitants and increasing their civilisation. Now, after a long period of industry and power, Scotland began to make advances towards that equality with England, in respect of comfort and prosperity, which it has since attained.

In 1756 broke out the "Seven Years' War," in which Britain took the side of Frederick the Great against France, Austria, Russia, and Poland. It achieved no triumphs in Europe; on the contrary, it suffered a signal disgrace in the surrender of the Duke of Cumberland's army to 40,000 men, in Hanover, in 1741; but in India, Clive deprived the French of most of their possessions, while Wolfe, in the New World, conquered their colony of Canada. In the midst of this war, George II. died (1760), and was succeeded by his grandson, George III., who, it was proved, was to be the longest and one of the most eventful in the annals of British history. At this time, the principal secretary of state was William Pitt, afterwards the great Earl of Chatham; but the favour which he enjoyed, both at home and in India, as well as in Scotland, a feeble and narrowed-minded Tory nobleman, rendered it necessary for the former to retire from office. Spain now joined France against Britain, as Pitt had foreseen and foretold; but fortune showered her blessings on the British, and, at the peace in 1763, she was allowed to retain many of the most valuable colonial possessions of both her antagonists. These wars, however, largely increased the national debt.

George III. now shewed himself anxious to destroy the influence of the great Whig families who had brought in the dynasty to which he belonged. The nation took the alarm, and for some time was strongly disposed in favour of Pitt's successor, Lord Bute, who was believed to be wholly under the influence of his Scotch premier, the Earl of Bute. Popular indignation at last forced the latter to resign in 1763. His successor, Grenville, inaugurated his advancement to office by the prosecution for libel of Wilkes, the member for Aylesbury, who had made himself conspicuous by his attacks both on Bute and his royal master. The proceedings in this case lasted some years, and were attended with terrors of a serious nature, and a vehemence if not ranour of public feeling that indicated the magnitude of the discontent which prevailed. During the administration of Grenville, too, the first attempt was made to tax the American colonies by the passing of the Stamp Act in 1765. Against this the colonies protested, and the succeeding Whig ministry of Rockingham repealed it. This ministry, however, was of short duration, and was replaced by that of Pitt, who, in the name of the Earl of Chatham. The necessity for an increase of the finances led to another attempt at American taxation, and an act for imposing duties on the imports of tea, glass, and colours, was passed. This measure excited the most determined opposition among the colonists; and, finally, in 1774, war broke out between them and the mother-country, which lasted eight years, and in which the former were supported by France, Spain, and Holland. It resulted in the acknowledgment of their independence, and in the formation of the republic of the United States (1783). During almost the whole of this unhappy contest, the ministry of Lord North directed the policy of the country; and it was only the success of a vote for the conclusion of the war that forced them to resign in 1782.

It was followed by the second Rockingham ministry, and that soon after by the Shelburne ministry, only remarkable for the appearance in it of the younger William Pitt. The latter, born Whig, at the commencement of the war, gave offence to Fox and other more advanced political thinkers; the result was a coalition of the Foxites with the followers of Lord North. This coalition, factious and unprincipled in the last degree, triumphed, and under the name of the Coalition ministry, held the seals of office during the year 1783. Fox's India Bill, the purpose of which was virtually to transfer the government and patronage of India from the East India Company to the House of Commons, was the cause of its rise. This bill was considered by the king as an attempt at fixing the ministry in power beyond the control of both himself and the people, and having induced the House of Lords to reject it, he compelled the ministry to resign. Pitt was then again the prime minister and chancellor of the exchequer. See Pitt. In 1786 commenced the trial of Warren Hastings, who was impeached by the Whig leaders, Fox, Burke, and Sheridan, but was acquitted. Meanwhile, the progress both of England and Scotland was unquestionable; manufactures increased, agriculture improved, and, especially in Scotland—an interest in the discussion of political and other questions, of which the French, had the public opinion of the country, as may be seen very clearly in the poetry of Robert Burns. The French Revolution (1789) at first strengthened this interest, but the excesses of the Reign of Terror produced a decided reaction; and for many years, all, at least, that was respectable, ' respectable classes,' were fanatically averse to the slightest innovation. In 1793, the ministry of Pitt, without any real cause, declared war against the French republic, in spite of the opposition of Fox and Sheridan. This contest lasted till the peace of Amiens in 1802, and was, on the whole, very disastrous to G. B., except at sea, where the victories of Howe, off Brest, Jervis, off Cape St Vincent, Duncan, off Campania, and Nelson at Copenhagen, not only compelled the French to evacuate the Channel, but also served to sustain the spirit of the nation. Other features of the time were the threatened invasion of Britain by the French, which called forth volunteer corps in every part of the island; the Irish rebellion, which, though assisted by a French force, proved a failure; and the trial and condemnation at Edinburgh of the popular reformers, Mure, Palmer, &c. Pitt, who had left office just before the peace of Amiens, was succeeded by Addington, who was compelled to renew the war with Bonaparte in 1803, on account of the way in which the latter evaded fulfilling the conditions of that peace. Again, Bonaparte threatened to invade the country, and collected an immense flotilla at Boulonnais, probably for that purpose, in 1803, but was completely kept in check by Nelson. The battle of Trafalgar in 1805 nearly annihilated the navy of France and Spain; but on land, the treaties of Amiens were violated by the battle of Austerlitz (1805) broke up most effectually that coalition ofcontinental powers against France which G. B. had fostered and formed. The shock of this disaster gave a death-blow to Pitt, who expired in the beginning of 1806, and was followed to the grave in the autumn of the same year by his rival, Fox. The overthrow of Prussia at Jena and Auerstadt, and of Russia at Friedland, placed G. B. in a most perilous predicament. All the
In 1830, George IV, died, and was succeeded by his brother, William IV. The outbreak of the July revolution in France quickened the pace of events in British politics. In May, opposition to the government in Ireland took the form of a insurrection, which was put down by an improvement in the parliamentary representation became very strong; and in November 1830, after an exclusion from office of nearly half a century, the Whigs once more ascended into power on the defeat of their great enemy, the Duke of Wellington. An improvement in the parliamentary representation became very strong; and in November 1830, after an exclusion from office of nearly half a century, the Whigs once more ascended into power on the fall of their great enemy, the Duke of Wellington. Another of its claims to the respect and gratitude of posterity was the abolition of slavery in the British colonies (1834). The reform of the English poor-law, and the mode of electing municipal authorities in Scotland, also deserves mention; but in 1834 the Whig ministry was dismissed by the sovereign. Sir Robert Peel now became premier, but the Whigs were still in a majority in the House, and Peel was compelled to resign. The Melbourne administration which followed carried several small though beneficial measures of reform, but it failed to secure the attachment of the people. The lower middle classes, which had anticipated becoming Radical and Chartist, were discouraged by the middle classes, contented with the political power which the Reform Bill had secured to them, were growing apathetic, and in many cases, from dread of the masses, were leaning towards Toryism. The Whigs were thus in the midst of all perplexities, William IV, died in 1837, and was succeeded by his niece, the Princess Victoria, the present ruler of the united empire. In 1841, the Whig ministry succumbed to a vote of 'no confidence,' and Sir Robert Peel once more assumed the helm of state. The ministerial changes in the Queen's reign had begun to be actively advocated; public opinion was leaning by the platform addresses of Mr Cobden and Mr Bright, until the prime minister himself was finally converted, and in 1846 carried, what he had long advocated, a great measure for the Corn Laws. Three years before the abolition of the corn laws, a great religious schism took place in the Established Church of Scotland, and led to the formation of a body calling itself the 'Free Church of Scotland' (q.v.). Other important incidents of this period were the Chinese and Afghan wars; the Chartist agitation, which reached its climax in the monster petition of 1848, got up by Feargus O'Connor; the Corn Bill, and the potato-crop of Ireland, involving that country in terrible misery, and inundating G. B. with pampers. Sir Robert Peel was succeeded in the government of the country by Lord John Russell, who did not prove a popular minister. Sir Robert Peel returned to power, and in 1852 the old Tory party returned to power, headed by the Earl of Derby and Mr Disraeli. It was, however, beaten on its budget, and forced to resign in less than a year, when its place was taken by the coalition cabinet of Lord Aberdeen. During the ministry of this nobleman, the Crimean War began (1854); but as Lord Aberdeen was considered to be somewhat pro-Russian in his likings, he was obliged to make way for Lord Palmerston in 1855. Two years later (May 1857), the Indian Mutiny broke out, and the energies of the government were taxed to the utmost to suppress it, but were eventually crowned with complete success. Never have the working-classes, who were for some time on the brink of starvation. About the same time, the Irish Catholics began to clamour for emancipation from their civil disabilities. The older and more inoffensive Tories, who were still dominant in parliament, opposed it; but the intense determination of the Irish people, and the powerful eloquence of their champion, Daniel O'Connell, at last prevailed, and in 1829, the dynasty of Wellington, yielding to the storm, itself proposed and carried the measure.
of subsidising 'denominational schools,' but religious differences and 'vested interests' have as yet proved an insurmountable barrier to its realisation.

GREAT BRITAIN, ROYAL ARMS OF. The arms of the United Kingdom of Great Britain and Ireland are thus borne by Her Majesty Queen Victoria.

Royal Arms of Great Britain:

Quarterly, first and fourth gu., three lions passant, gard. in pale, or, for England; second, or, a lion rampant within a double trefoil flory countercontoury gu., for Scotland; third, az. a harp or, stringed ar., for Ireland; all surrounded by the Garter.

Crest.—Upon the royal helmet, the imperial crown proper, thereon a lion statant gardant or, imperially crowned, al. prope.

Supporters.—Dexter, a lion rampant gardant or, crowned as the crest. Sinister, a unicorn ar., armed, crined, and unguled or, charge a corselet composed of crosses potence and fleur-de-lis, a chain affixed thereto, passing between the fore-legs, and rejected over the back, also or.

Motto.—Diu et num Driet in the compartment below the shield, with the Union rose, shamrock, and thistle engrafted on the same stem.

Arms have been ascribed to heralds to the Saxon and Norman monarchs of England in the 10th and 11th centuries; but as heraldry was, in point of fact, unknown till the middle of the 12th c., they must be dealt with as fabulous. However, at a period almost before the earliest dawnings of hereditary cost and arms, the sovereigns of England, in common with various other monarchs of Christendom, adopted the lion as their device. Richard I., in his earliest seal, has two lions, which are some counter-rampant; but in the latter part of his reign, after his return from the third crusade, the great seal of Crée-de-Lion represents the three lions in pale and passant gardant, as they have been almost uniformly depicted since. The only subsequent instance of which we are aware of any variation in the number is on a seal of the Carmelites at Oxford, in which Edward III. is represented in a surcoat charged with four lions in pale passant gardant, a proof of the latitude which heralds occasionally allowed themselves as late as the beginning of the 14th century. In 1340, Edward III., in virtue of the supposed right of his mother, assumed the title of king of France, and quartered the arms of France with those of England, giving to the former the precedence. The fleurs-de-lis were then generally borne sans nombre: but in the latter part of the reign of Henry IV. they were reduced to three, borne or on a field azur. No further change took place in the royal escutcheon until the time of James I., except that Mary, on her second Great Seal, made after her marriage with Philip II. of Spain, impaled the arms of Spain and England.

James VI. of Scotland, on succeeding to the throne of England, quartered the arms borne by preceding sovereigns with those of Scotland and Ireland, the first and fourth quarters being France and England quartered as before, the second quarter the lion rampant of Scotland within the double trefoil (see SCOTLAND, ARMS OF), and the third quarter the harp of Ireland (see IRELAND, ARMS OF).

The royal arms were similarly borne by all the sovereigns of the House of Stuart till the reign of Anne, except that William III. bore over the coat of Nassau (az. semé of billets, a lion rampant or) on an escutcheon of pretence. In the reign of Anne, the legislative union with Scotland brought about a material change. England and Scotland impaled were placed in the first and fourth quarter, France in the second, and Ireland in the third. The accession of George I. displaced England and France from the fourth quarter, to make way for the arms of his majesty's German dominions. These were gu. two lions passant gardant in pale for Brunswick, impaled with or, semé of hearts gu. a lion rampant az., for Lüneburg, having the arms of anceric Saxony—viz., gu. a horse courant ar. en bede, impaled with a shield of quartered arms: the crown of Charlemagne proper, being the badge of the arch-treasurer of the Holy Roman Empire. A further alteration took place on the union with Ireland, when George III. laid aside the titular assumption of king of France, and abandoned the French ensigns. The arms of England were now made to occupy the first and fourth quarter, Scotland the second, and Ireland the third, while the German ensigns were relegated to an escutcheon of pretence. These were placed in the third quarter, on the severance of Hanover from the crown of Great Britain, which took place on the accession of Queen Victoria, and the royal escutcheon thus assumed its present arrangement.

From the union of the crowns of England and Scotland under James I., up to the union of the kingdoms in 1707, the royal arms were somewhat differently marshalled in Scotland, Scotland being allowed in all Scottish seals, ensigns, and arms to occupy the first and fourth quarter, and England the second, while the whole were ensigned with the crown of Scotland; but the Act of Union of 1707 recognises no royal ensigns but those of the United Kingdom, which are to be 'such as the King shall think fit;' and by 29, 40 Geo. III. c. 67, on the union with Ireland, it was enacted that the armorial bearings of the United Kingdom 'shall be such as his majesty by his royal proclamation under the Great Seal of the United Kingdom shall be pleased to appoint.' The practice, which prevails to a certain extent in Scotland, of giving the precedence to the Scottish lion in the royal shield, is incorrect, though the error has been committed in several of the official seals of the kingdom.

The lion passant on the crest of England first appears on the Great Seal of Edward I.

The supporters borne in former times by the kings of England varied much, particularly during the early period when these appendages of the shield were invested with more of a decorative than a heraldic character, and perhaps often left to the fancy of the engraver. When the arms of any of the English sovereigns from Richard II. to Edward IV. are represented with supporters, the animals selected are almost indifferently lions, antelopes, or white harts, and occasionally the place is supplied by angels. Edward IV.'s shield is sometimes supported on one side by a black bull, and Richard
GREAT CIRCLE or TANGENT SAILING—DIRECT KANAWHA.

III's in one instance—in a MS. in the British Museum—on both sides by white boards. During the reigns of Henry VII. and VIII., Edward VI., Mary, and Elizabeth, the lion, red dragon, and greyhound were the supporters most in vogue, and as the herald or engraver had it not in his power to represent all three at once, he seems to have been allowed to select any two at pleasure. James I. for the first time clearly defined the royal supporters, adopting the lion of England and unicorn of Scotland as they have ever since been borne, the unicorn having been, up to 1707, allowed the precedence in Scotland.

GREAT CIRCLE or TANGENT SAILING. In order to have a clear idea of the advantages of great circle sailing, it is necessary to remember that the shortest distance between two places on the earth's surface is along an arc of a great circle (see SPHERE); for instance, the shortest distance between two places in the same latitude is not along the parallel of latitude, but along an arc of a circle whose plane would pass through the two places and the centre of the earth. The object, then, of great circle sailing is to determine what the course of a ship must be in order that it may coincide with a great circle of the earth, and thus render the distance sailed over the least possible. This problem may be solved in two ways, either by means of an instrument called the 'spherograph,' or by the computation of a spherical triangle. The first of these methods will be explained under the head of Spherograph (q. v.). The method by computation will be understood from the accompanying diagram:

\[ \text{Diagram} \]

more represents a meridian which passes through the place \( p \), \( m \) a portion of another great circle; let \( p \) be the place sailed from, and \( x \) the place sailed to, then \( px \) is the great circle track, and it is required to determine the length of \( px \) (called the distance), and the angle \( zpx \) which it makes with the meridian (called the course). To determine these two, we have three things given: \( x \), the co-latitude of \( x \); \( m \), the co-latitude of \( p \); and the angle \( x \), which, measured along \( xz \), gives the difference of longitude.

The problem thus becomes a simple case of spherical trigonometry, the way of solving which will be found in any of the ordinary treatises on the subject of Spherical Trigonometry.

From the theory of great circle sailing, the following most prominent features are at once deduced: A ship sailing on a great circle makes straight for the port, and crosses the meridians at an angle which is always varying, whereas, by other sailings, the ship crosses all meridians at the same angle; or, in

nautical phrase, her head is kept on the same point of the compass, and she never steers for the port direct till it is in sight. As Mercator's Chart (q. v.) is the one used by navigators, and on it the course by the ordinary or Mercator's track is laid down as if it were a straight line, it follows, from the previous observations, that the great circle track must be represented by a curve, and a little consideration will show that the latter must always lie in a higher latitude than the former. If the track is in the northern hemisphere, it lies nearer the north pole; if in the southern hemisphere, it is nearer the south pole. This explains how a curve-line on the chart represents a shorter track between two places than a straight line does: for the dilute ignorance and shortness of latitude is the same for both tracks, and the great circle has the advantage of the shorter degrees measured on the higher circles of latitude. Consequently, the higher the latitude is, the more do the tracks differ, especially if the two places are nearly on the same parallel. The point of maximum separation, as it is called, is that point in the great circle which is furthest from the rhumb-line on Mercator's Chart. Since the Mercator's Chart of Decimal Sailing (q. v.) prevents a ship from being kept for any length of time on a prescribed track, and thus necessitate the calculation of a new path, in practice, the accurate projection of a great circle track on the chart would be a waste of time. In general, it is sufficient to lay down three points—the place sailed from, the place sailed to, and the point of maximum separation, and through these points to draw an arc of a circle. As the rhumb-line and great circle track between two places, one in the north latitude and the other in southern latitude, cross each other at the equator, in this case there will be two points of maximum separation, and the course and distance must be calculated for each side of the track separately.

GREAT FISH RIVER is the name of two streams in opposite extremities of the British empire.—1. G. F. R. in Cape Colony rises in the Snowy Mountains; and, after a generally south-eastern course of 230 miles, it enters the Indian Ocean, in lat. 33° 25' S. and long. 27° E., having at its mouth a bar, which renders it inaccessible to any decked vessel.—2. G. F. R. of British North America, known chiefly as the route of Back and King, in search of Ross, enters an inlet of the Arctic Ocean, in lat. 67° 8' N. and long. 94° 40' W., after a north-east course, the length of which, however, has not yet been ascertained. Its character is as unfavourable as its position to navigation and commerce.

GREAT KANAWHA, a considerable river of North America, and an affluent of the Ohio, is called New River in the upper part of its course, and rises in the north-west of the state of North Carolina, between Blue Ridge and Iron Mountain. It flows westwards for upwards of 100 miles between parallel mountain ranges, then turns north and north-west, it breaks through several ridges of the Alleghanyes, and continues to flow in a north-west direction to its junction with the Ohio.
at Point Pleasant, after a course of about 400 miles. About 100 miles from its mouth, on being joined by the Gauley river, it takes the name of the G. K.; and two miles lower, its course is marked by a remarkable fall of about 50 feet. Up to this fall, the river is navigable.

GREAT MARLOW, a municipal and parliamentary borough in Buckinghamshire, finely situated on the north bank of the Thames, in lat. 51° 34' N., and long. 0° 46' W., 31 miles north-west of London. The Thames falls of about 140 feet by a suspension-bridge (constructed in 1835), which has a span of 225 feet. The principal manufactures are silk, lace, and paper. G. M. returns two members to parliament. Pop. in 1861, 6505.

GREAT SALT LAKE, a remarkable and extensive sheet of the surrounding scurfy, the lake North America, has given name to the Salt Lake City (q. v.), the Mormon metropolis, which is situated at its south-eastern extremity. It lies in one of the great valleys or basins of the Rocky Mountains, which is about 700 square miles; and 250 miles broad, yet its average depth is only seven or eight feet, and it nowhere exceeds a depth of 33 feet. Its surface is 4200 feet above the level of the sea. In the middle of the lake, several islands rise the one above the other and are connected with the water; the principal island is in lat. 41° 10' N., and long. 112° 21' W. The islands are in number, one of them is 12 miles, and another 16 miles in length. The water of the lake is so salt as to form one of the most famous of the salt-based brines known in the world. It contains 22 per cent. of chloride of sodium, slightly mixed with other salts. This lake, in whose waters no living creature is found, receives, from the north, by the Jordan, the waters of the Utah lake, which are fresh, and those of the Wear river from the north; but it has no outlet. It has been called the 'still innocent Dead Sea,' and certainly in the quality of the water, and the wild, weird picturesqueness of the surrounding scenery, the lakes greatly resemble each other. The first mention of the G. S. L. was by Baron La Hontan, in 1689, who did not himself visit it, but who gathered some notions of it from the Indians west of the Mississippi. It was first explored and described in 1843, by Colonel Fremont. A thorough survey was made in 1849-1850 by Captain Howard Stanbury of the United States army, whose report was printed in 1852. See SALT LAKE CITY, and Utah.

GREAT SEAL. By Act of the Union between England and Scotland (q. A. 4, c. 8), one Great Seal for the United Kingdom of Great Britain is used for sealing writs to summon the parliament, for treaties with foreign states, and all public acts of state affecting Great Britain. The holder of the Great Seal is now generally called the Lord Chancellor. A seal is also kept in Scotland for sealing grants and writs affecting private rights there. By the law of England, the Lord Chancellor has the custody of seals, which, by a great judicial power, he has also no authority to act in this capacity in Scotland, where a similar authority is vested in the Court of Session. As regards Ireland, the Act of Union, 39 and 40 Geo. III. c. 67, provided that various acts as to summoning parliament, &c., should be done under the Great Seal of the United Kingdom; but in other respects, the Great Seal of Ireland is used in the same manner as before the union.

GREAT SALT LAKE, an extensive and regular sheet of water. British North America, is situated in lat. between 60° 40' and 63° N., and in long. between 109° 30' and 117° 30' W. Its greatest length is about 300 miles, and its greatest breadth 50 miles. It is surrounded, especially on the north, by rugged and precipitous shores; it contains many islands, some of them wooded, and is wholly frozen over for six months of every year. On the north, it receives the surplus waters of Lake Aylmer and Lake Athabaska, and on the south, those of Lake Athabaska. Its own surplusage of water is carried off by the Mackenzie River to the Arctic Ocean.

GREAT SLAVE RIVER, a river of British North America, forms the outlet of Lake Athanaska and flows in a north-west direction from the former to the latter. It is about 300 miles in length; its banks in many parts are well wooded; and its course, which in the upper part is interrupted by falls and rapids, lies through an alluvial region in the lower part.

GREAT WALL OF CHINA. See CHINESE EMPIRE.

GREGAVES (Fr. Grèves), pieces of armour formerly used as a defence for the legs (in the patteMs of Burgundy, grève still signifies 'shin'). They were originally made of leather, quilted linen, &c., and afterwards of steel, hallowed to fit the front of the legs, and fastened with straps behind. The Greeks termed them καινημίδες (whence the frequent expression in the Iliad, εὐκνημίδες Αχιλλοῦ, the 'well-graved Greeks'), and the Romans Θρέβας.

GREBE (Podiceps), a genus of birds of the family Columbidae, having the feet webbed not in the usual manner, but by a separate membrane for each toe, united only at the base. The tarsi (shanks) are so much compressed as to be almost like blades. The claws are large and flat. The bill is about as long as the head, straight, and conical. The wings are short. There is no tail. The legs are attached so far back that the birds when on land assume an erect position, like penguins. They walk with difficulty, and all their motions on land are awkward. They sometimes sit along on their bellies like seals. But in water they are extremely agile; they swim rapidly, dive with extreme quickness if alarmed, and pass to very considerable distances under water, moving there by means of their feet alone, and threading their way with wonderful expertness among the stalks and leaves of aquatic plants. They feed on fishes, brachiopods, crustaceans, and other aquatic animals, partly also on vegetable food. They are said sometimes to carry their young under their wings, and even to take them under water with them in diving to escape from enemies.

The geographical distribution of the genus is very wide, and some of its species are also very widely distributed. Four species are British, two of which are only winter birds of passage; but the Great-Crested G. (P. cristatus), and the Little G. (P. minor), also called Dabchick or Dorchick, are resident all the year. The Great G. is by far the most common British species. It does not exceed ten inches in length. The Great-crested G. is rare, even in winter, when the number is increased by visitants from the north. It is sometimes called the Satin G., from
the beautiful shining silvery feathers of the lower parts of its body, on account of which it is in great request, the skin being used to make muffs for ladies, or cut into narrow strips for trimming their dresses. G. shooting is a favourite amusement on the Lake of Geneva; the G. is pursued by a boat, whilst it seeks to escape by diving and swimming under water. The males of some of the grous have the head finely ornamented with tufts. The plumage of most of them varies much at different ages and seasons.

Grecian Architecture. The origin of the architecture of Greece is, like the origin of every art and science in that country, mixed up with mythical and fabulous history. It is divided into three styles, and each of these has its mythical origin. Thus, the Doric is said to have been copied from the early wooden huts of the aborigines; the Ionic, which sprang up among the Greek colonists in Asia Minor, to have been modelled on the graceful proportions of the female figure, as the Doric had been on the more robust form of a man—the volutes representing the curls of the hair, the fluting the folds of the drapery, &c. The story of the origin of the Corinthian style is very pretty: a nurse had deposited in a basket on the grave of a departed child the toys she had amused herself with when alive. The basket was placed accidentally on the root of an acanthus, and in spring, when the leaves grew, they curled gracefully round the basket, and under a flat stone which was laid on the top of it. Callimachus, the sculptor, seeing it, caught the idea, and worked out at Corinth the beautiful capital since called after that city.

Modern discoveries have, however, shown that Greece owed much to the earlier civilisation of the countries which preceded it in history. To the architecture of one or other of these, almost every feature of Greek architecture can be traced. But it is for the first idea only that the Greeks are indebted to Egypt and Assyria; whatever forms they adopted, they so modified and improved as to make them part of their own architecture.

Grecian architecture is divided into three styles—the Doric, Ionic, and Corinthian (see Column, figs. 4, 5, 6). Of these the Doric is the oldest. The earliest example, which remains is the temple at first sight to be Doric; it is only on close inspection that we find that the Echinus (q. v.) is wanting under the capital. The echinus was, however, used by the Egyptians. We here find ourselves in the cradle of Greek art. Here is the spot where we must seek for the first origin of the style, not in Greece, where the earliest example is already complete in all its parts. The earlier the example, the more massive the form. This completely disproves the theory that the Doric pillars were the stems of trees used as posts. It seems more likely that the first pillars were square piers of rubble or brickwork, with a flat stone or tile laid on the top, to form a good bed for the beams to rest on. These formed the architrave, stretching from pier to pier, on which rested the cross-beams supporting the rafters of the roof, the ends of the latter suggesting the dentils and modillions (mullotes) of the cornice, the former, the triglyphs (see Entablature). The square form of the pier was afterwards modified by cutting off the corners, and again cutting off the remaining corners, until the polygon suggested the fluted shaft. The same process was afterwards gone through by the medieval architects in developing the Piers (q. v.) of Gothic architecture.

After the temple at Corinth, the next remaining example is the temple at Agrigentum (q. v.), built about a century later, or 530 B.C. There may have been many temples at the same site, but in the same date, but they were probably destroyed during the Persian war, or removed to make way for finer buildings during the great building epoch of Greece which succeeded that war, and when she was at the summit of her power. Of this epoch, we have many remains. The temple of Theseus and the Parthenon at Athens (438 B.C.), that of Jupiter at Olympia (440 B.C.), Apollo Epicurias at Bassae, Minerva at Supium, and all the best examples of the Doric style of Greece, are of the age of Pericles. Besides the Peloponnesus, there are the countries colonised by the Greeks to which we can look for remains of Greek architecture. The Doric colonists of Sicily and Magna Grecia carried with them the style of the architecture of their native country, and furnish us with many fine examples. In Sicily there are six temples, the oldest being about the same age as that at Corinth. At Agrigentum there are three Doric temples, one of them founded by Theseus (480 B.C.); this is the largest Grecian temple of the period, being 360 feet long by 173 feet broad. At Syracuse, Agrigentum, and Paestum there still remain many valuable examples. As the Doric art progressed, the early massive forms gave place to more elegant and slender proportions. In the temple at Corinth the column only 4.47 diameters in height; in the Parthenon (fig. 2), which is universally recognised as the fir

![Fig. 1](image1)

at Corinth, which was built about 650 B.C. The remains of this temple show the various members of the style fully developed, but they are all of a massive and heavy description, strongly resembling in this respect their prototype the architecture of Egypt. There is now no doubt, although the intermediate steps are lost, that the Doric style took its origin from the rock-cut tombs of Beni-Hassan (q. v.) in Egypt, of which fig. 1 is an existing example. The pillars of one of these tombs appear

![Fig. 2](image2)

e example of the style, the column is 6.025 in height; and in later examples it becomes still taller and thinner, until it runs into the opposite extremity from which it started, and becomes so meagre and
Grecian Architecture.

attenuated as to lose entirely the boldness and vigour of design which are the chief characteristics of the style. One thing to be particularly admired in the Doric style is the beauty of the sculpture with which it is adorned, and the appropriate manner in which the sculpture is placed in the building, and the building suited for the sculpture. It has been shewn by Mr Penrose that every line was the subject of the designer on the part of the architect, for the purpose of correcting and allowing for all optical aberrations. The result is, that there is hardly a single straight line in the building; all the lines, which appear to be perfectly straight, are drawn with accurate curves, so as to produce the smoothest and most pleasing effect to the eye. Every harsh angle is softened, and every disagreeable combination of lines avoided. For example, the columns have an Entasis (q. v.) or slight swelling formed by a hyperbolic curve; the architrave of the front is curved upwards, so as to correct the optical illusion caused by the sloping lines of the pediment, and the columns are sloped slightly inwards, so as to give greater appearance of solidity.

The Parthenon is built of a white marble, and the whole of the masonry in this, as in other Doric works of importance, is put together with the most perfect workmanship.

There seems to be no doubt that this and other Greek temples were adorned externally with colour. To what extent this decoration was carried, is not clearly ascertained; but it is probable that the exterior walls were covered with historical pictures, which were sheltered from the effects of the weather by the portico surrounding the temple. The sculpture was probably also relieved by a flat colour on the background, and the moulings decorated with painted or gilded ornaments.

This style flourished in its rise about 500 B.C., and as we have seen that the earlier Doric was imported from Egypt, so the Ionic seems to have originated from the influence of Assyrian art. The recent discoveries of Layard and others have shown that many of the characteristic ornaments of the style were in common use in Assyrian architecture. The volutes of the capitals are particularly indicative of an Eastern origin, the scroll being an ornament of very common use in all Eastern art.

The finest examples of the Ionic style remaining in Greece are the temples of the Wingless Victory (a vá oíptéros) and the Erechtheum at Athens, built about 420—400 B.C. In the Ionian and other colonies of Asia Minor, also, many fine examples of this style were erected. The celebrated temple of Diana at Ephesus was of the Ionic order. It was the largest temple we know of up to its time, being 453 feet long by 229 feet wide. No trace of it now remains.

The Ionic is a graceful and elegant style, but not so pure and severe as the Doric. The latter is distinguished by simple and beautiful outline, enriched with the most perfect sculpture; the former tends to ornamentation for its effect. This love of elaborate ornament is an indication of the Eastern influence under which it was originated, and the mouldings and many of the ornaments are found to be identical with those of Assyrian architecture, only refined and simplified by the Greeks. The honeysuckle ornament (fig. 3), so commonly used both in Assyrian and Ionic architecture, is a good example of the improvement effected by the Greeks on the original type. In the Ionic as well as in the Doric, we find the most perfect execution and workmanship, the spirals, entasis, &c., being all drawn and cut with the greatest possible exactness.

Corinthian.—This style was the latest introduced, and combines, to some extent, the characteristics of both the preceding. It unites and blends together the characteristics of the Egyptian and Assyrian, for the purpose of correcting and allowing for all optical aberrations. The result is, that there is hardly a single straight line in the building; all the lines, which appear to be perfectly straight, are drawn with accurate curves, so as to produce the smoothest and most pleasing effect to the eye. Every harsh angle is softened, and every disagreeable combination of lines avoided. For example, the columns have an Entasis (q. v.) or slight swelling formed by a hyperbolic curve; the architrave of the front is curved upwards, so as to correct the optical illusion caused by the sloping lines of the pediment, and the columns are sloped slightly inwards, so as to give greater appearance of solidity.

GRECIAN ARCHITECTURE—GREECE.

their temples; that suggested by Mr Ferguson seems the most probable, as being similar to the plan used by the Egyptians and Assyrians. The interior had generally a double row of columns, one over the other, dividing the width into three spans. This arrangement still exists in the temple of Neptune at Paestum. Mr Ferguson supposes that the light was introduced by counter-sunking a part of the roof, so as to admit the light between the pillars of the upper range, thus forming a kind of clerestory, as shown on the annexed section of the Parthenon (fig. 6). Windows, however, were also used, as in the temple at Agrigentum and in the Erechtheum.

The temples of the Greeks formed another very important class of works; they consisted of semi-circular rows of seats cut in the rock, or partly built. Remains of these structures are found in all the countries inhabited by the Greeks, and were frequently of great size—that at Dranysauns being 443 feet across. The proscaenia were the parts on which architectural design was chiefly displayed; but these have unfortunately all perished.

None of the palaces or domestic edifices of the Greeks remain to us; we are thus totally deprived of a very interesting chapter in the history of domestic architecture, for it is highly probable that the streets and houses of Greece, although not so splendid and enduring as the temples, were more varied in style, and exhibited many picturesque and beautiful forms, which are now entirely lost.

The attempt has been made in modern times to revive Greek architecture, and some ingenious modifications and adaptations of it have been carried out. But it was found that this style, so beautiful and appropriate in the warm and genial climate of Greece, was quite unsuited for our northern latitudes. The porticos are useless in a climate where external painting cannot last, and where the sunshine is courted rather than excluded; the pitch of the roof is not high enough to throw off our snows; and windows of sufficient size for our dark skies are not admissible. Greco-Roman architecture has therefore been abandoned; and its place is now taken by a style more appropriate to our climate, and more suited to the feelings of the people.

GREECE. The name by which the ancient Greeks delighted to call their native country was Hellas (q.v.). The terms Greek and Hellene were first used by the Romans, being derived probably from a small tribe in Epirus, near Dodona, called Graikoi, with whom the Romans may be supposed to have been, from proximity, best acquainted.

Extent, etc.—This country, so celebrated in the history of freedom, of literature, of art, of philosophy, and of civilisation generally, varied much in size at different periods of its history. Hellas at first was applied only to a small district in Thessaly; at a later period, it denoted not only the Morea, and what is commonly called G. Proper, but also Macedonia, Epirus, and the islands of the Aegean.

Boundaries.—(1) Ancient. The northern limit of ancient G. may be fixed about the 40th parallel of N. lat., the south extremity being in 36° 23'. The barrier separating G. from Illyricum and Macedonia on the north, was that range of mountains which, starting from the Adriatic sea, forms the Cumbrian range, which runs from the Adriatic up to the centre, and runs out into the sea on the east as the far-famed Olympus. The Aegean Sea washes the country on the east, the Mediterranean on the south, and the Ionian and Adriatic on the west. The greatest length is about 250 English miles, and the greatest breadth 180; the area (not including Epirus, but including Euboea) is about 21,000 square miles—i.e., about two-thirds the size of Scotland. The Cyclades are reckoned by themselves, and amount to rather more than 1000 square miles. See Islands at end of article. (2) Modern. The extent of modern G. is much more limited. Its north boundary was fixed in 1834 by a line drawn (in lat. 39° 8' N.) from the point where the Gulf of Arta (Ambracia) in the west to the Gulf of Volo (Pagasae) in the east, thus excluding the greater part of Thessaly and much of Acarnania, with the Epirot districts. The greatest length of this territory is now more than 200 English miles, and its superficial area, including Euboea, but not the Cyclades, about 15,000 square miles, or half the size of Scotland.

Physical Conformation. — G. is essentially a country of mountains, hills, and valleys. From the ridge which forms its northern frontier, there starts in a southerly direction the Pindus chain, the backbone of G., dividing Thessaly from Epirus, and giving origin to the famous pass of Thermopylae. Some ridges of less note run westward. From this point, the great central chain extends in a south-east direction (though with many windings), as far as Mount Citharon, and even through Attica as far as Cape Sunium, bearing the names of Parnassus, Citharon, and Hymentius; while in a south-west course we find many ranges crossing the country towards the Ionian Sea and the Gulf of Corinth (Lepanto), in a direction parallel with, or slightly inclined to, that of the central chain. The somewhat lateral range of Citharon and Parnes, on the borders of Attica, is extended through Megarid into the Morea or Peloponnesus by a lower ridge, which, passing across the isthmus of Corinth, stretches even to the west coast. Of this range, the two most conspicuous points are Mounts Cyllene and Erymanthus, from which two chains run south on the east and west of Arcadia respectively, and under the names Taygetus (Pentadactylon) and Parnon (Malév), terminate in the promontories of Tanaron and Malca. Besides these, there are many shorter chains and individual peaks, which it would be tedious and out of place to detail; it may be sufficient to state, that there is no country of Europe, except Switzerland and the west parts of Scotland, which can be compared to G. in the extent, variety, and irregularity of its mountain system, and the number and character of its valleys. Of all the divisions of G., Arcadia is most like Switzerland in its rugged nature and generally elevated surface. Some of the mountain peaks of G. rise to a great height; thus, Olympus is 9700
Greece.

English feet, and is covered with snow; Guzona, on the frontier, 8240 feet; Parnassus, 8001; with many others, 7000, 6000, and 5000. Helicon is 4963; Cithaeron, 4630; Cyllene, 7745; while the Acrocorinthus, or citadel of Corinth, is 1869 above the level of the sea. The mountains of G. are more remarkable for the suddenness of their rise than for their great elevation. So, too, there are many smaller peaks and cones notable for the abruptness with which they rise from the plain, such as the Acrocorinthus, the rock of Ithome, and the Meteoras cliffs of Thessaly near the Penetus. These last are huge masses of rock standing out from the plain to heights varying from 100 to 300 or 400 feet, with sides perpendicular as a wall. They assume the shapes of pillars, cones, and other figures more or less regular: they cover a space of nearly two square miles, the recesses between the pinnacles being filled with trees and dense brushwood. The only access to which is by baskets, nets, or ladders swung in the air.

Minerals.—G. is not rich in minerals: gold, silver, copper, lead, and iron, are found, but the mines have never been worked. The most famous mines in ancient times were those of Laurium in Attica. Coal is found in Eubea and in some parts of the Peloponnesus; salt is procured in many districts of G. and in the Ionian Islands; and marble of the purest kind, and of various colours, may be had in endless amount in almost all parts of Greece. The most famed quarries were in Paros, Carystus (in Eubea), Pentelicus, and Hyetottus. Marble and building-stone were quarried at Dodone, in Epirus, and in Arcadia. There are many mineral springs, both cold and hot, and many caverns still emit those medicinal exhalations which in bygone days quickened the imagination of the poet, and confirmed the superstition of the peasant.

Plains and Valleys.—The valleys of G. are very numerous, but owing to the great number and irregular distribution of the mountain-ranges, are very small. The two great plains are those of Thessaly and Boeotia, the former being the largest and the most fertile in all G.: that of Messenia is both extensive and fertile.

Coast-line.—As Europe is pre-eminent among countries in the great extent of its coast-line, G. for a similar feature remarkable among the kingdoms of Europe. The bays are very numerous, and many of them run far up into the land, so that no part of the country is far from the sea—a circumstance which gives the inhabitants great facilities for commerce, and which leads the modern Greeks, as it did the ancients, to occupy themselves in very large numbers with maritime affairs.

Water-system.—(1) Rivers.—The rivers of G. necessarily follow its valleys in character. None of them are navigable. The most important stream is the Achelous (Aspropotamo), which rises in Mount Pindus, flows in a south direction through Epirus, and empties itself into the Ionian Sea, at the mouth of the Gulf of Corinth, after a course of about 130 miles. The Sperchius rises in the Pindus range, and disembogues into the Malic Gulf, after traversing for more than 60 miles the fertile vale which is bounded by the old Greek Mon Monotharia, and on the south by Mount (Eta). Besides these, there are in North G. the Cephissus, rising in Doris, near the base of Mount Parnassus, and flowing through the fertile Boeotian plain into Lake Copais (Lago di Tepoglia, or Lake of Livadia); and in the south part of Boeotia, the Asopus (Vurteli). In Peloponnesus, the principal streams are the Eurotas (Vasiliptamo) and the Alpheus (Roufia). By the banks of this latter, the great Olympic games were celebrated. The rivers of G. depend for their supplies mainly on the atmosphere; hence in summer the larger streams are greatly reduced in size, and the majority of the smaller ones are either almost or altogether dry channels. Many of them are nothing more than mountain torrents, or gulleys, which the heavy rains of autumn and winter fill for a short season.

(2) Lakes.—The many hill-encircled valleys of G., from which there is no outlet, afford the most favourable opportunity for the formation of lakes; hence the rains of autumn and winter stagnate in many cases in the valleys of the mountains, and for at least a month or two form a lake. The largest of these is the Vouliagmenos, which forms the lake of the same name, a large embayment of the Gulf (Aspropotamo), having a maximum breadth of 2600, and a maximum depth of 800 feet. There are several others which extend from the lake of the Vouliagmenos, the lake of Parnassus, and the lake of Corinth.

Climate.—The climate of G. varies very considerably in different parts of the country. In the highlands of the interior, the cold in winter is often very severe, snow lying for several months. On the plains, and in the lower parts of the coast, the snow is seldom seen; but the north and north-west winds are frequently very trying, though there is no intense cold. The summer heat is often excessive; and the sirocco not unfrequently visits the south and lower parts. In summer, too, there is much difference; thus, while Attica is remarkable for its pure air and beautifully bright sky, Boeotia has been famed from ancient times for the moisture of its climate and the fogginess of its atmosphere. The swamps covering the upper parts of the Peutelicus, or the marshy tracts, when acted on by the scorching heat of a summer's sun, produce those noxious vapours which are found in so many parts of G., breathing malaria: they have increased since classical times, either from the greater thinness of the population, and the consequent diminution of tillage, or other causes not easily reached. But drainage would be an easy matter in a country whose rock-formation is of such a character as that of Greece. Were its national advantages aided by drainage and irrigation, G. might yet become one of the healthiest and one of the most fertile countries of Europe.

Productions.—The more common products of Greek soil in ancient times were wheat, barley, and other cereals; flax, wine, and oil, with fruits of various kinds. The figs of Attica were and still are famed for the excellence of their flavour. Forests once covered many of the hills, and supplied timber for domestic purposes and for ship-building; they are still extensive in some parts. The most important productions of modern G. are those mentioned above, with maize, rice, millet, currants, and silk. Honey is produced in great quantity on Mount Hyemina and in some parts of the Peloponnesus. The mulberry-tree is largely grown for the silkworm; and on the north and south shores of the Gulf of Corinth, as well as in Arcadia, and the west coast of the Peloponnesus, the Corinthian grape or currant is most extensively cultivated. Vines flourish in almost all parts, but the island of Santorin possesses the most famous vineyards, with the greatest variety of grapes, and furnishes a wine of the highest quality. The olive grows in a wild state over all parts of G.; when ingrained, it yields an excellent fruit, which the inhabitants pickle in very large quantity, as a staple article of food. The oil of the olive serves to supply light, and is used in cooking and for food, as we employ butter. Cotton, madder, tobacco, and leguminous plants grow in considerable quantity. Fruit trees are specially fertile; figs and apricots are

79
plentiful and of excellent quality; oranges, citrons, lemons, pomegranates, almonds, water-melons, gourds, and others of less note are widely spread, largely produced, and of excellent quality.

The flora of Greece resembles that of other countries of South Europe. Among the tame animals of ancient G. were the horse, mule, ass, ox, sheep, goat, swine, dog. The swine supplied the favourite flesh meat, and the ox a great deal of material for the soil, and even lions and tigers were common in early times. Sheep and goats are still very plentiful, and in fact constitute one of the most important sources of wealth to the Greeks. Oxen are much used for ploughing, but mulch cows are little prized, and scarce. At the present day, the wolf, bear, lynx, wild-cat, boar, stag, roe-buck, fox, jackal, badger, marten, and many other wild animals are found in the forests. Hares, snipes, wild-ducks, and other game are very abundant; while eagles, vultures, hawks, owls, &c., are found in considerable numbers. The tortoise is very common, but the inhabitants have a great aversion to it.

**Agriculture.**—The agricultural implements are still as in ancient days, a great number of Greek muskets, many of 3000 to 6000 lbs., but the majority are small-boat, fitted for short voyages from island to island, or to ports near Greece. It is as agents and carriers that the Greek merchants cut the most notable figure, in fact, the great commission-agents and carriers of the Mediterranean. Greek merchants have now established themselves in London, Liverpool, Manchester, Glasgow, and other towns of the British empire, as well as in France and in Germany; and as they have greater facilities for collecting articles of commerce from the inland parts of their own and contiguous countries, besides, as they despise no sort of commission or merchandise, however small or heterogeneous, they have, in almost the entire traffic of the Ottoman empire, of Persia, and of other eastern countries.

**Internal Commerce.**—But one great drawback to the development of Greek resources, and the increase of a home-commerce, is the bad state of the internal communication. Without a navigable river, with not a single canal, and with less than 100 miles of road fit for a donkey-cart in the whole extent of its territory, it is little wonder that the inland inhabitants are devoid of energy and enterprise, and that they consume but little of the imports from abroad. Mules, asses, horses, and men carry on their backs over rugged paths, and through the marshy parts of the province, most of foreign luxuries and necessities for the Greek peasant of the interior. Even from Athens to Corinth there is no carriage-road!

**Political Divisions.**—In ancient times G. was divided into a great number of petty states, each consisting of at least a city and some portion of surrounding territory. There was no king ruling over the whole country, no federal union which embraced all the states, no common council or government. Amphictyonic leagues did exist at one period, and in later times the Achaean and Ionian leagues were formed with patriotic and national objects in view, but these applied only to a limited area, and were of only local operation; hence quarrels were of constant occurrence, and G. wasted on internal struggles those energies and means, which, if properly harnessed, united, and directed, might have raised her to the very pinnacle of fame and of prosperity in every department of human industry and human exertion. It was only when some monster danger threatened universal destruction that all united for the common good, as in the Persian invasions, and even then jealousies and selfish interests caused many to join with those
GREECE

who sought to ruin the fatherland. The division of Ancient G., as laid down on maps, affords a very imperfect idea of the political condition of the country, singly or collectively, by its natural extent and who so long known to the world under certain names, it will be best to mention them as usually given. Starting at the south-east, we have the triangularly shaped Attica, separated from Boeotia on the north by a certain exemption from the jurisdiction of Phocia, Doris, Locris, Etolia, Acarnania, Epirus, Thessaly, and Ebura; and in the Peloponnese, Argolis, Laconia, Messenia, Elis, Achaea, and Arcadia, with Megara, partly on the isthmus of Corinth. By the annexation of 1832, which is G. is divided into ten provinces or nomarchies, which are again subdivided into forty-nine eparchies, and these again into demarchies or cantons. Of these ten, there are in Hellas, or Northern G., Attica and Boeotia, and Phocis and Phthiotis, Acarnania and Aetolia; in the Peloponnese, Argolis and Corinthia, Achaea and Elis, Arcadia, Messenia, Laconia, in the islands, Eilen, and the Cyclades. See ATTICA, BOEOTIA, PHOCIS, PHTHIOTIS, ACARNIA, and AETOLIA: in section ‘Islands’ at end of this article.

Government.—In ancient G. each state managed its own affairs, and governments were of different kinds. In Homeric times, monarchy seems to have prevailed to a great extent, but in later years republics, aristocracies, and oligarchies almost entirely usurped the ruling power; factions were rife, and in many cases their contests led to a total disintegration of the body-politic. (See articles on individual cities and states.) The government of modern G. is a constitutional monarchy. There is a Senate and a Chamber of Deputies, which, with the king, form the legislative body. The king’s person is sacred; he ‘can do no wrong,’ as by ancient law. The Senate consists of 150 members, and is a constitutional monarch, restricted by the two Houses of Senators and Deputies; but, practically, his will is law, and he is not checked either by ministers, senators, or deputies. Greek statesmen have not yet learned to apply the political independence and self-respect, and hence, rather than lose office, with its attendant pay (800 drachmas per month), they are content to act as puppets in the king’s hands, which is the case with a certain number of noble families. These families own their honour for life, and receive 500 drachmas (about £18) per month as pay; they must be at least 40 years of age at the time of their appointment. The deputies are chosen for three years by the votes of the people. There are two classes of deputies, who possess some property, or follow some profession, in the district to be represented. They must be at least 30 years old, and men of some property or fixed profession. They receive 250 drachmas (£9) per month. In the provinces, there are governors, deputy or sub-governors, and assessors, all of whom are nominated by the king, and paid by the state. All Greek citizens are equal in the eye of the law; civil and religious liberty is guaranteed; the press is free; private property is held sacred; the education of the people is undertaken at the public cost; offices of state and positions of distinction are open to all.

Administration of Justice.—The supreme court of justice is called, as in Athens of old, the Areopagus. Besides this, there are 2 courts of appeal, 3 courts for commercial suits, 10 courts for civil and criminal causes, and 120 justice of peace courts, with all the orthodox companion- ments of lawyers, juries, notaries, &c. There is a complete code of laws to meet all the cases which may arise between man and man. Capital punishment is executable for certain offences, the guillotine being the instrument of execution. The most numerous class of felons are brigands and assassins. The Greek judges enjoy a well-earned reputation for independence and strict uprightness.

Army and Navy.—The population of Greece is very small, numbering not more than 8000 or 9000 men, of whom upwards of 1000 are officers. The period of service is four years, and the force is recruited by a levy of 2000 men each year. All Greeks (with a few exceptions) are liable to the service, if called on, or provide a substitute. There is a police force, or gendarmerie, which is dispersed over the kingdom, and a kind of irregular troops, or militia, to guard the frontiers, and keep down brigands. These are the latter of the only effective forces. The combined forces amount to about 11,000 men. The navy is little better than a name. It consists almost entirely of small vessels, with one or two steamers and corvettes. It is useless as a defence from foreign powers, and serves only to repress piracy, and that in an ineffective way. The naval station is Porsa, on an island of the same name at the entrance of the Gulf of Eginna.

Money, Weights, and Measures.—The unit of the monetary system is the Drachma (q.v.) = 8½d. English; the unit of weight is the oke = about 2 lbs. 11 oz. avoidilupoids; the common measure of length is the pique = 27 inches. A strama of land is about ½ of an English acre.

Finance.—The financial affairs of G. seem to be in a state of hopeless bankruptcy. The kingdom started on borrowed capital, the three great powers of England, France, and Russia having guaranteed a loan of 60 millions of francs (£24 millions) partly to indemnify Turkey and other creditors of G., and partly to assist agriculture and manufactures in their early struggles. The expenses of the court and government, the carelessness of officials, and the non-receipt of the tax revenues, are probably the greatest embarrassment of the exchequer, so that at the present time the Greek treasury owes upwards of 300,000,000 dr., a third of which is due to the three powers, and the remainder to capitalists, principally in England.

Inhabitants (Ancient Greece).—Of the earliest inhabitants of ancient Greece we have no definite knowledge. The term autochthones (sprung from the soil itself)—usually applied to themselves, means no more than this, that the people had been there from time immemorial, and that future generations had not the means or the inclination to trace their origin any further back. The Pelasgi, who are supposed to have been in the time of the Trojan war, who possessed some property, or follow some profession, in the district to be represented. They must be at least 30 years old, and men of some property or fixed profession. They receive 250 drachmas (£9) per month. In the provinces, there are governors, deputy or sub-governors, and assessors, all of whom are nominated by the king, and paid by the state. All Greek citizens are equal in the eye of the law; civil and religious liberty is guaranteed. The press is free; private property is held sacred; the education of the people is undertaken at the public cost; offices of state and positions of distinction are open to all.

Modern G. is of a very mixed kind. In Etolia, Acarnania, Thessaly, the greater part of Peloponnesus, and most of the islands, the descendants of the old Greeks are still predominant; but a very large admixture of Albanians (see ALBANIA) prevails in Attica, Boeotia, Phocia, and Argolis, with the islands of Spezia, Salamis, Hydra, and Andro. The true Greek is easily recognised by his tall stature, slim body, aquiline nose, oval face, and moustache. Whiskers are not considered stylish and respectable; the beard is worn only in mourning. The Greeks are uncommonly temperate both in eating and drinking, and in the indulgence of the passions generally; flesh is seldom eaten; the diet is principally vegetable. The Greeks are devotedly attached to their
fatherland, and their love of liberty and independ-
ence is not less strong than it was in the days of
Miltiades and Themistocles. Aristocracy is, in conse-
quence, at a discount; and though they love and
are loyal to a good ruler, yet they are easily roused
into resistance by the infringement of their rights.
Commercial bargains are the delight of the Greeks,
and they often manage, it is said, to part with their
wares at twice their value. This decrepit they prac-
tise who attend the courts of the Turks especially. The
women are very plain. Early marriages are common
in Greece. Greek matrons take great pride, like
Nisian, in old, in a numerous and beautiful offspring.
Still many of the children are cut off in infancy by
the fevers which prevail so commonly. Two
peculiar branches of the Greek race are the
Mainotes (from a district called Maino) of the
Peloponnesus, and the Pallikars of the north
highlands. The former, who boast to be the descend-
ants of the ancient Spartans, inhabit principally
the mountain fastnesses of Taygetus, where for
centuries they defied the power of the Turks. They
resemble in their sturdy independence, feudal
relations between the various classes, and in other
costumes, the Highlanders of Scotland 150 years
ago; but in recent times, education, mixture with
other races, and commerce, have to a great extent
removed the distinctive peculiarities and the
Pallikars, that is, Brus, originally belonged to the
northern parts of G.; but when Thessaly and
other portions were by treaty left in the lands of
the Turks, these hardy mountaineers chose to
leave their ancient homes and settle in the new
kingdom, to establish which they had shed their
blood. The red cap, the white shirt, and the golden
jacket, mark them out even to the casual observer
as a separate class. They go about armed, and
attend to their houses and flocks, and their servants
form a little army.
The islanders are almost all seamen or traders;
they wear the red cap, a short jacket, and wide
Turkish trousers. The Albanians form about a
quarter of the population, they are a strong, hard-
race, and engage in agricultural or other severe
labour. They are the hewers of wood and drawers
of water to the more wealthy classes. They speak
a language which is little allied to either Slavonic
or Greek. The Wallachs are a nomad and pastoral
race; they sleep on the hillsides with their flocks,
which are guarded by ferocious dogs. There are
large numbers of Maltese at Athens, and the
Portuguese at the island of Paros. They are
settlers from Western Europe. The Bavarians who swarmed into
G. on the accession of King Otho have almost all
disappeared.

Religion.—See the articles GREEK RELIGION
(Ancient), and GRECK CHURCH.

Education (Ancient).—The education of the ancient
Greeks was more of a physical than of a mental
kind. The gymnastic was that of the athlete, not
that of the didaskalo or preceptor. Young children were,
till about their sixth year, trained at home
under females, but were then sent to the didaskalaria,
or schools under the charge of private tutors or
pedagogi. The duty of the pedagogue was rather
to keeo his wards from outward injury and bad
companions, than to teach them the accomplish-
ments of grammar (including reading, writing, and
arithmetic), music, and gymnastics, the favourite
subjects of study in those days. In later times, the
more intelligent slaves were specially trained for
the duties of the pedagogue. —Modern.—Education
of all kinds, from the humblest school to the uni-
versity, is free to all. Hence an unusual number
of youths press into the learned professions, and a
large educational machinery is necessary to supply
the demand for knowledge. There are about 370
communal or elementary schools, and 180 Hellenic
schools, in which, among other branches, ancient
Greek is taught. Besides these, there are—a military
school, a polytechnic, for trades and professions;
lyceum; a normal school; an agricultural
school; with seminaries for female education; and
finally, there is the university of Athens, with four
faculties— theology, philosophy, law, and medicine.

All the wealth of the Greeks, and the youth of all ages are most zealous in prosecuting
their studies.

Language (Ancient).—The Greek language is a
branch of the Indo-European languages, usually
called Indo-Germanic or Aryan. It
prevailed not only in the different parts of G., but
also in the numerous Greek colonies which fringed
the shores of the Euxine and the Mediterranean.
But it must not be supposed that it was of the
same type at all periods of Greek history, or in all
parts of G., even at the same time. The three
great branches of the Greek tongue were: 1. The
Attic, the oldest form, and that which presents the
greatest resemblance to the modern languages of
the Indo-Germanic stock. 2. The Doric, a high-
land dialect, delighting in broad and rough sounds;
it was spoken in the mountains of Thessaly, whence
it spread to the north and west, and was adopted by
the Dorians, took possession of the Peloponnesus.
3. The Ionic, a soft and vocal language, delighting in
delightful sounds, and avoiding the harsh combina-
tion of consonants; it was spoken principally
by the Greeks in Asia Minor, and the Ionian colonies
in Asia Minor. From it was made, by a series of
contractions and modifications, that most perfect
form of the Greek language, the Attic, which was
neither so harsh and broad as the Doric, nor so soft
and vocal as the Ionic, but combining both the
great perfection of the poems of the poets, and the
height of perfection by the philosophers, and the
historians of G., whose writings still teach the
world, and command its admiration. By the
conquests of Alexander the Great, the Greek
language soon spread over a large portion of the
known world, but corruption at once set in—words
of other languages were adopted into the Greek,
foreign idioms were introduced, and the rigid syntax
of the great Athenian writers was neglected, so that,
in process of time, there arose a depraved form of
speech, called the Hellenistic, varying in many
essential points from its great parent. In this
last form, the books of the New Testament were
written, in what is now called the New Testament
Greek, and which still retains, so to speak, a
resemblance to the Attic. This form still exists in
the Eastern Church, which is called the Old Greek.

The language was divided into several
forms, which were spoken at different periods
of the country, and in different districts. The
classical Greek was the language spoken by the
ancient Greeks, and was the language of the
authors of the New Testament, who were
Greeks. The language used by the authors of
the New Testament is called the New Testament
Greek, and is now called the Neo-Attic. This
language bears a very close resemblance to the
Hellenic, or classical Greek; and in fact does not differ more, if at all, from the Attic, as the Attic
differed from the Doric. Information on this subject must
be sought in a grammar of the language. Great
sufficiency have been made in recent years to purge
the Neo-Hellenic of barbarisms and foreign terms,
and it is now written with such purity, that
good scholars in ancient Greek will have little
GREECE.

difficulty in understanding Tricomi's history or an Athenian newspaper.

Literature. — The literature of Greece is a subject so extensive, that we cannot hope to give any adequate view of it in our limited space. Those who wish to study the matter further, must have recourse to a full treatise. Poetry seems to have been the earliest form of composition among the Greeks, as indeed it must of necessity lie in all nations, for facility of recollection; hence Memory is called the Mother of the Muse. The earliest species of poems seem to have been hymns in honour of the gods; to these succeeded songs praising the glorious deeds of heroes; but the greatest poem of ancient times which has come down to us is the Iliad of Homer, detailing the events connected with the siege of Troy, and the warriors who took part in that famous expedition. The Iliad and Odyssey have been too long and too generally known and admired to need a word said in their commendation. The remarkable popularity of the Homeric poems produced a host of imitators; and hence we find that a great many poets endeavoured to rival the fame of the 'blind old man,' by narrating in verse the after-fate and vicissitudes of the heroes who took part in the war of Troy, or by treating the same subjects, though on a smaller scale, with even of mythological fables. These were called the Cyclic poets; they were posterior to Homer and Hesiod; their writings were put together in chronological order by the grammarians about 200 B.C. The Homeric period is closed by the name of Hesiod. Homer is supposed to have flourished about 900 B.C., and Hesiod about 850 B.C. Hesiod's most celebrated writings are the Theogony, the Sikhs of Homer and Hesiod, and the Works and Days, an agricultural poem. Of his others, only small fragments are preserved. Epic poetry culminated in Homer, and with him and his contemporaries it sets. Of lyric poetry, there were two schools—the Lyric in Asia Minor and adjacent islands, especially Lesbos, and the Doric in Peloponnesus and Sicily. Of the Ionic school, the earliest poet was Callinus (700 B.C.); after him came Archilochus, so famed for his cutting satires, writing the first of which was written 680 B.C. The mind of Archilochus, who contests with Archilochus the honour of having invented iambic verse. Alcman and Sappho (about 610 B.C.) represent the Ionic school in its perfection. Nor must we forget the Sicilian poet Stesichorus (about 520 B.C.), to whom, however, are attributed many pieces which are not considered genuine. Of the Doric or choral school, it may suffice to mention Alcman, Stesichorus, Arion, Simonides, Bacchylides, and greatest of all in every known variety of choral poetry, Pindar (q. v.). The Theban (522 B.C.)

Greek literature reached its highest perfection in the tragedies of Aeschylus (born 525, died 456 B.C.); Sophocles (born 495, died 406 B.C.); and Euripides (born 480, died 406 B.C.). The writers who endeavoured to follow in the track of these three great masters were of far inferior merit, and with them tragedy degenerated to the effeminacy of lyrical song and a sort of pantomime.

Comedy, like tragedy, took its origin from the worship of Bacchus. The three great names of the old Attic comedy are Cratinus, Eupolis, and Aristophanes (born 452, died 398 B.C.). In the middle comedy, we have the names of Antiphanes and Alexis; and in new comedy, Philemon and Menander.

History did not engage the attention of the Greeks till a comparatively late period. Passing over the names of Cudow of Miletus, Pherecydes of Scyro, Hecataeus, and Charon of Lampacus, we come to Herodotus, the Father of History, or, as he has been called, the Homer of History, who flourished about 440; Thucydides, about 430; and Xenophon, about 400. In later times, we find Polybius (204—122 B.C.); Dionysius of Halicarnassus, who flourished about 291 B.C.; Diodorus Siculus, a contemporary of Julius and Augustus Caesar; Plutarch; Appian (the time of Hadrian and Antoninus Pius); Arrian (time of Hadrian); and Dion Cassius. In geography, we have Strabo and Pausanias. In satire, the palm is carried off by Lucian (q. v.). In oratory, it may be sufficient to mention the names of Antiphanes (born 490 B.C.), Andocides (467 B.C.), Lyias (458 B.C.), Isocrates (436 B.C.), Aeschines, the great rival of Demosthenes (389 B.C.), Hyperides; and last and greatest of all, Demosthenes (355 B.C.). On the philosophers, see PHILOSOPHY.

Literature (Modern). — The literature of modern G. is still in its infancy. No work of importance appeared previous to the revolution; but since the establishment of the kingdom in 1829, more life has been infused into the men of a literary bent. The names of the brothers Panagiota and Alexander Souris are well known to many in England. They have written dramas, love-songs, novels, lyrics, and a poem (by Arcadian) in the style of Childe Harold, detailing the wanderings, sights, and adventures of a Greek in France and Italy. In most of these there is much merit, though few readers can fully appreciate them. Among dramatic writers, Neroulis, Rangavis, and Charouzis hold a foremost place. The Memoirs of Different Battles fought between the Greeks and Turks from 1820 to 1829, by Pernavos, is a well written book. In general literature, G. Gennadios, Scarlutto Byzantino, and others have done good service to the cause of learning. But of all the Neo-Hellenic works yet published, the History of the Greek Revolution by Tricomi is the most valuable—valuable not only for its statement and facts, but also for the purity and elegance of its style. Many newspapers and other periodicals, in Neo-Hellenic, are published at Athens, Constantinople, London, and elsewhere; but the expense of these literary efforts in modern G. is great, and the mission of the wealthy Greek merchants, now so frequently met with in the west of Europe. It will require many years of good government, of national industry and prosperity, before G. can assume that position in the world of letters which the prestige of her name entitles her to anticipate.

History (Ancient). — The early history of G. is lost in the mist of ages. The legends of gods and heroes, which constitute her only approach to history, are of that marvellous kind in which a superstitious and ignorant age delights. But much truth may underlie the stories of Cecrops, Cadmus, Danaus, Theseus, Heracles, and many others, it is difficult to say; or to what extent the events of the Argonautic expedition, Trojan war, and the Calypsonian boar, and other joint-stock exploits, may be real, historians can never hope to discover. The heroic age is roughly dated from 1400 to 1200 B.C.; but all Greek chronology is mere guess until the first Olympiad, 776 B.C. Of the migrations which took place during these early days, and of the numerous colonies planted by the Greeks in the 7th and 6th centuries, it is not necessary to speak in this brief sketch; nor can we do more than merely refer to the wars of the Spartans against the Messenians, which begin in 743 B.C., did not ultimately terminate until Lyrbe was destroyed in the 3rd Messenian war, to speak of in different parts of Greece; Solon legislates at

55
Athens (504 B.C.); Pisistratus and his sons enjoy the ‘tyranny’ at Athens from 560 B.C. to 510 B.C.; Creesus, king of Lydia, and Cyrus the Great, his conqueror, are brought into contact with the Asiatic Greeks (560—542 B.C.). And now, in 499 B.C., the burning of Sardis by the Athenians and Ionians leads to those three invasions of G. by the Persians which so gloriously for G., and so disastrously for Persia, and with the particulars of which all are so well acquainted. The first, under Mardonius, in 492 B.C., was repelled by the Spartans, who defeated the invading fleet off Mount Athos; the second, under Datis and Artaphernes, in 490 B.C., is hurled back from Marathon; and the third, under Xerxes, 480 B.C., is utterly defeated at Thermopylae and Plataea. G. is now a mighty name, but the Athenians become the ruling state, and their supremacy continues till 404 B.C. Meantime, discord among his sons leads to the conflicts with foreign enemies. The great Peloponnesian war begins in 431 B.C. and wastes the energies of G. for 27 years, until the subjugation and partial demolition of Athens, in 404 B.C., put an end for a time to the fratricidal struggle. It was in 415 B.C., the 17th of the 22 years of this famous and deplorable connection to Sicily took place. Under Pericles, who was the ruling spirit of Athens at the commencement of the war, but who died of the great plague in 429 B.C., the Athenians reached the highest pitch of excellence in sculpture and architecture; they were raised up as the successors of those wondrous buildings whose remains still excite the admiration of posterity at a distance of more than 2000 years. In 404 B.C., the expulsion of Cyrus the Younger by his half-brother Artaxerxes, took place; the battle of Cunaxa, in which Cyrus was slain, was fought in the same year. Cyrus had employed Greek mercenaries, and this brief war is specially famed for the unexampled massacre of the 10,000 Greeks under Xenophon in the Athenian in 401—400 B.C. The next year (399 B.C.), Socrates the philosopher, the teacher of Plato and Xenophon, was put to death. After the defeat of the Athenians in the Peloponnesian war, the Spartan state becomes the leading power in G., and was engaged in four wars in succession—1st, the Elean (399—398 B.C.); 2d, the Corinthian (395—387 B.C.); 3d, the Olynthus (366—370 B.C.); 4th, the Theban (378—362 B.C.). The great Spartan hero of these troublous times was Agesilaus, whose panegyric has been written by Xenophon with a friendly pen. During these eventful years were fought the battles of Coronea and of Corinthus (394 B.C.), Orchomenus (375 B.C.), Leuctra (371 B.C.), Mantinea, in which the Theban hero, Epaminondas was slain, 302 B.C. In 339 B.C., Philip ascends the throne of Macedonia, and a few years afterwards finds occasion to interfere in the affairs of Greece. Some of the allies of Athens renounce his supremacy, and thus arises the Social war (357—335 B.C.), in which Athens loses many of her tributaries, and much of her revenue. The Sacred war (335—316 B.C.) immediately follows, in which Philip takes part. About this time (352 B.C.), Demosthenes delivered the first of those powerful orations against Philip, called Philippics. In the battle of Chaeronea (338 B.C.), the Athenians and Thebans are utterly defeated by Philip; and at the congress of Corinth, in the following year, he is appointed generalissimo of the Greek forces against Persia. But the hand of the assassin cut him off at a marriage-feast in Macedon; and after an unsuccessful revolt against his son Alexander, the Greeks are compelled to bestow upon the youthful hero the same high military office with which they had intrusted his father. The events of Alexander’s career are well known. From this time G. becomes an appanage of the Macedonian kingdom, until Macedon is in turn overcome by the Romans. During the wars which arose among the successors of Alexander, G. was always the bone of contention; she suffered in consequence many hardships, and enjoyed but few lulls of peace. The last struggle for Greek liberty was made by the Achaean League (a confederacy of cities at one time embracing all Peloponnesus, which had a common object, a common enemy, and common arrangements), which too fell before the conquering arms of Rome; and after the capture of Corinth in 146 B.C. by the consul Mummius, the once mighty G. became a province of Rome. History (Modern).—The history of G. for some centuries after the capture of Corinth belongs to the history of her conqueror. The Roman wars with Antiochus, Mithridates, and others, involved G. in countless hardships; and the fierce struggles of Caesar and Pompey, of Brutus and Cassius with Antony and Octavianus, of Antony and Octavianus, of which G. was often the theatre, entailed upon her many calamities. For nearly two centuries after the accession of the Antonine emperors, G. enjoyed comparatively tranquillity, during which Christianity spread among her people, churches were founded, and many devoted Greeks went abroad to strange lands and perished in the propagation of the Gospel. But dark days again awaited her, and successive invasions of Slavonians, Albanians, and other barbarous hordes, overran the country from the wintry plains of the north. When Constantine divided his empire, G. was placed in the eastern portion, but when in 1291—1294 A.D., the Venetian fleet under Dandolo overpowered the rocking throne of the Caesars, G. too changed masters. The Osman Turks, who migrated to Europe in 1355 A.D., and made themselves masters of Thrace, Macedonia, Thessaly, and other parts, captured Constantinople in 1453 A.D.; and from that time until recent years, G. was subject to Mohammedan dominion. All the annoyances that ignorance, brutality, tyranny, and greed could suggest were pressed upon the Turks on the much enduring G. But at length human nature could no longer endure, and in 1820 broke out that rebellion against Turkish rule, which, by the bravery and determination of the Greeks, and the complicity of the Western Powers, ended in the establishment of the E. as an independent kingdom in 1829. Two unsuccessful attempts at rebellion had been made in 1770 and 1790. Capo d’iствria, the first president of liberated G., was assassinated in 1831; and after several candidates for the throne of the infant kingdom had been proposed and rejected, Otho, second son of the king of Bavaria, was at length (1832) chosen by the three powers (Britain, France, Russia) which had assisted G. in her noble struggle. The reign of Otho has not been a peaceful one, as may be gathered from some of the preceding remarks, and he has had very serious difficulties to contend with since he assumed the reins of government in 1833. But his rule has not been altogether devoid of fruit; and law and order, industry and commerce, literature and notions of self-government, have made considerable strides within the last thirty years. Otho, with the capital in a more suitable position, the internal communication of the country duly organised, agriculture more encouraged and better rewarded, we may yet hope to see G. one of the most thriving states of modern Europe. Population.—The population of ancient G. at any one time it is quite impossible to approach; conjectures of the most wild and opposite kind have been hazarded, but it is useless to repeat them.
Of modern G. the inhabitants numbered, in 1857, 1,045,232.

The Islands.—The islands of the Ægean Sea may be comprehended, as in ancient times, under two groups—the Cyclades and the Sporades. The former were so called from the legend of their circling round Delos when that island was rendered stationary for the birth of Diana and Apollo. The latter received the name because of the circumstance of their being scattered or sown in an irregular manner round the coasts of the adjoining countries. The Cyclades and some of the Sporades near Eubea belong to G.—all the others to Turkey. The following list contains those belonging to G.; the rest belonging to the Cyclades proper, the remainder lie off Eubea. The Italian names are in parentheses. The Sporades will be given under Turkey.

1. Delos with Rhenea (Dili); 2. Syros (Syra); 3. Mykonos (Mykono); 4. Tinos (Tino); 5. Naxos (Naxia); 6. Andros (Andro); 7. Ceos (Zea); 8. Cithnos (Therma); 9. Serifos (Serpho); 10. Siphnos (Siphanto); 11. Kimolos (Argintaria); 12. Melos (Milo); 13. Pholeon (Pholeandro); 14. Naxos (Naxos); 15. Paros (Paros); 16. Ios (Ios); 17. Anafi (Anafio); 18. Amorgos (Amorgo); 19. Paros (Paro); 20. Oliaros or Antiparos (Antiparos); 21. Schyros (Scyro); 22. Schiathos (Sciathe); 23. Thasos (Thasia); 24. Andros (Andromoe). Besides those, there are many smaller islands and barren rocks, which belong to G., but which from their unimportance scarcely deserve mention. These islands possess many of the features which mark the mainland; they are fertile in some, fruitful in one, fruitful in another; the productions are much the same as in G., except that in some of them, as Santorin, the vine grows in greater variety and luxuriance; the population is more primitive, and less mixed; the mode of life, the customs of their forefathers. The islanders are generally more industrious and more happy than the continental—the sea is their highway, and they can more easily get a market for the fruits of their industry. The islanders are excellent seamen, and a very large proportion of the males are employed in navigation. Delos is now little more than a barren rock; and scarce a vestige remains of the temple of Minerva, the church, the ruins of that former religious and commercial pre-eminence.

Syra (population about 16,000) is the principal port of G., and a great centre of trade. The Mediterranean steamers call at it. Wine is almost the only product of the island.

The people of Tenos are famed for the manufacture of marble tables, chimney-pieces, &c., which are largely exported, and the finest Malvasian or Malmsey wine is produced in the island. Of the other islands, the most volcanic is Thera; it produces in large quantity the wine called Vino Santo, or Santorin, of which the Russians are specially fond. Naxos is the largest and most beautiful and most fertile of the Cyclades. These islands comprise an area of rather more than 1,000 square miles, and a population of about 230,000 souls. The Cyclades are generally high and rocky in their coasts, and all are of a very similar aspect in this and other regards.

GREECE.—GREEK CHURCH.

The Greek Church, taken in its widest sense, comprehends all those Christians following the Greek or Slavonic type, rite, who receive the first seven general councils, but reject the authority of the Roman pontiff, and the later councils of the Western Church. The Greek Church calls itself "the Holy Orthodox Catholic and Apostolic Church," and it includes three distinct branches—the church within the Ottoman empire, subject directly to the patriarch of Constantinople; the church in the kingdom of Greece; and the Russo-Greek Church in the dominions of the czar. The last must form the subject of a separate article, but it must also be alluded to in treating of the sister-churches. The proper history of the Greek Church as a separate body dates from the commencement of the Greek schism, or rather from the commencement of the efforts on the part of the church of Constantinople to establish an independent headship in the eastern division of the empire. The ecclesiastical pre-eminence of Constantinople, it need hardly be said, followed upon the political distinction to which it rose as the seat of the imperial residence, and the centre of the imperial government. Originally, Byzantium was but a small episcopal see, subject to the metropolia of Heraclea; but the rank of the see rose with the fortunes of the city; and before the close of the 4th c., a canon of the first council of Constantinople, held in 381, assures us to, on the ground that 'Constantinople is the new Rome,' the precedence of honour next after the ancient Rome. This canon, it is true, does not recognize any pre-eminence of jurisdiction, but does concede to the bishop of Constantinople, and, indeed, there are several early instances in which questions arising within the district which afterwards became the patriarchate of Constantinople, were referred to the bishops of Rome. But the transition was not difficult, and was aided by the eminent qualities of some of the bishops, and especially of St John Chrysostom. This pre-eminence, which grew as the Turks invaded and conquered the old Rome, upon the political precedence to which both successively had risen. The Roman legates protested against this canon, and the claim led to a misunderstanding between the two churches, which was widened and confirmed by the doctrinal differences which prevailed on the Eutychian question, in which the patriarchs of Constantinople gave their support to the Henoeotan, a heterodox or equivocal term, for the priest in the case of the emperor was warmly resisted in the East. The pope, in consequence, in 484, excommunicated the emperor, together with the patriarchs of Constantinople and Alexandria; and thus the East and West were, de facto, separated for a period of nearly forty years. The terms upon which the excommunication was withdrawn by Pope Hormisdas in 519, involved a complete and explicit acknowledgment of the supremacy of the Roman pontiff; but the rivalry of Constantinople still subsisted. In the end of the 6th c., the Trullan Council (see Trullan Council) caused a renewal of the misunderstandings. Many circumstances combined to hasten a rupture: the title of 'Ecumenical patriarch' claimed by the patriarch John the Faster, and reproached by Gregory the Great (see Gregory I.); the contests about image-worship, in which the patriarchs, in more than one instance, took the part of the Iconoclast emperors; the abandonment of the claim of the defence of Italy against the Lombards; the gradual growth of an independent confederation of Italian states, and ultimately the foundation of a new empire of the West, the political antagonism of which, with the eastern empire almost necessarily involved an antagonism of the churches themselves. Hence, when, upon occasion of his own personal contest with the see of Rome, the deposed patriarch Photis (862), the great Eutychian (see Eutychian), and with that of the Eastern Church, he found a
Greek Church.

Deezy sympathy with his countrymen. The Latin doctrine of the twofold procession of the Holy Ghost (the addition of 'Filioque' to the Latin creed), the Latin practice of clerical celibacy, and of denying to priests the power of administering confirmation, supplied the grounds of quarrel; and although the schism fell with its author, and the communion of the churches was restored, the reconciliation was imperfect and far from cordial. The same causes of controversy, with others of a disciplinary nature, were renewed in the 11th c.; and in 1054 the pope Leo IX. issued a formal sentence of excommunication against the patriarch Michael Cerularis, which was solemnly published in Constantinople by the papal legates. Beyond the points of difference alleged by Photius, the most important of the new grounds of contention was the use of unleavened bread by the Latins in the eucharist. Since that time, the separation has been perseveringly maintained. More than one attempt was made by the authorities upon either side to restore the former relations of the two churches, but in vain. The old antipathies of East and West became more inveterate by the separation; and the occupation of Constantinople by the Latins (1201), the outrages and atrocities by which it was disfigured, the re-establishment of the Latin kingdom at Constantinople, and the arbitrary tyranny by which it was maintained, widened still more the ancient estrangement. Nor was the breach healed by the re-establishment of the Greek empire (1261). The policy of the Latin Church pressed on all sides by the fears of foreign invasion and the embarrassments of domestic discontent, proposed, as the price of the assistance of the West in their necessity, the restoration of the Eastern Church to the supremacy of the Roman pontiff. Michael Palæologus, the Eastern Emperor, consented (see Michael Palæologus); by his ambassadors abjured the schism at the council of Lyons in 1274; and endeavoured, by a synod held subsequently at Constantinople, to obtain a ratification of the union; but he failed to gain the assent of the body of bishops; and in the succeeding pontificate, the breach was even more seriously renewed, by two synods held at Constantinople in 1283 and 1285. The necessity of John Palæologus, attended at the great Western Council (1437) at Ferrara (better known, from the place of its close, as that of Florence), and a protracted discussion took place, the chief points of which were the procession of the Holy Ghost from the Father and the Son, the addition of 'Filioque' to the creed, the nature of the purgation of souls after death, the use of unleavened bread in the eucharist, and the supremacy, by divine right, of the Roman pontiff. On all these points, the Greek delegation, with the exception of Mark, Bishop of Ephesus, subscribed the decree of the council; but this union was equally short-lived. On the return of the delegates, their proceedings were repudiated by the large body of the Eastern Church, and the doctrine of the Greek empire and capture of Constantinople by the Turks in 1453, obliterated every trace of the attempted reconciliation. Since that time, some isolated bodies of Christians of the Greek rite have joined the church of Rome (see United Greek Church); but every attempt at a general union on the part of the Roman pontiffs has proved a failure. It has been the same with the attempts which have been made by the Protestant communions to establish an understanding with the Greek Church. Very early, after the Reformation, a letter was addressed by Melancthon to the patriarch Joseph of Constantinople through a deacon, Demetrius Myus, who visited Germany in the year 1558. Another Lutheran embassy of a more formal character, headed by the well-known Tubingen divines, Andreas and Crisius, visited Constantinople during the patriarchate of Jerome (1576–1601). But both missions were equally without result. In the following century, the celebrated Cyril Lucaris (see Lucaris), who had been educated in the West, and had carried home with him a strong, though for a time carefully concealed bias towards Protestantism, opened the way for negotiations with the Calvinistic party. Soon after his elevation to the patriarchate, he issued a decidedly Calvinistical confession of faith (1629). But far from carrying his fellow-churches and, with Patras, Arabia, Egypt, and parts of Mesopotamia and Persia. But with the first triumph of the Koran, the church of Constantinople by degrees lost almost all her territory in Asia and Africa; and since the conquest of the Turks, it has sunk into the condition of a weak and considerably diminished power. The separation of the Russian branch, partially in the 17th, and finally in the beginning of the 18th c., and by that of the new kingdom of Greece, on occasion of the revolution, its importance has been still more diminished. Each of these divisions into which it has separated possesses a distinct organisation; but as the faith and practice of all are substantially identical, we shall first give a brief account of the doctrines of the Greek Church, especially in their relations to the Christian communions of the West, and to the controversies by which they are separated from each other.

In general, it may be inferred from the fact that the Greek Church receives the first seven councils, that on all the controversies regarding the Trinity and Incarnation the Greeks are agreed with the Western Catholics, with the sole exception of the double procession of the Holy Ghost, in which they are opposed to the Roman Church. It may be said with the entire body of Western Trinitarians. While they reject the papal claim to supremacy and doctrinal authority, they agree with Catholics in accepting as the rule of faith not alone the Bible, including the Dendermonathal books (see Synod of Jerusalem in Harduin's Col. Concil., xi. col. 238), but also the traditions of the church, that is, what are believed to be the unwritten revelations of our Lord and of the apostles, preserved by the testimony of the fathers, among whom they regard with special veneration...
GREEK CHURCH.

Basil, Gregory of Nazianzum, and Chrysostom. They admit the seven sacraments as received by the Roman Church—viz., Baptism, Confirmation, Eucharist, Penance, Holy Orders, and Matrimony; but in the rites used by them in the administration of these sacraments there are considerable discrepancies from the Latin rite. They administer baptism by a triple immersion; ordination by a rite peculiar to themselves; connection with baptism, even in the case of infants, and it is administered by priests, and not, as among the Latins, by bishops exclusively. As to the eucharist, the Greeks admit the real presence of Christ, the transsubstantiation of the elements, the propitiatory sacrifice, and (although this has been denied by Protestants) the adoration of the host (see Renaudot, _Library, Collectio_, i. pp. 22, 23). But they differ from Catholics in the use of bread, in administering the communion in both kinds, and in administering it in this form even to children. In the sacrament of penance, they recognize, like the Western Catholics, auricular confession, private absolution, and penitential sinning; and although they differ from the Latins as to the use of indulgences, they admit the principle upon which their use is founded, and even their applicability to the dead. The peculiarities of the use of extreme unction and the sacrament of death, which led to the creation of a separate_ section_ in the sacrament of holy orders, they have many peculiar observances. See _Orders, Holy_.

The most striking point of difference regards clerical celibacy. The Greek Church recognizes the excellence of virginity and the life of prayer, and its observance by those engaged in the ministry, so far as to prohibit marriage altogether to bishops (who are always chosen, in consequence, from the monastic, and not the secular clergy); to forbid priests or deacons to marry; and to prohibit all, without exception, a second marriage, or marriage with a widow; and to require of married priests that they shall live separate from their wives during the time when they are actually engaged in church services. But they not only permit married candidates to be advanced to deaconship and priesthood, but even require, as a general rule, that they shall be actually married before they can be admitted into the church. In admitting marriage to be a sacrament, they hold it to be indisputable in case of adultery, and they regard fourth marriages as utterly unlawful. On the condition of being after death, they do not admit with Western Catholics the question of the observance of the principle of the intermediate state of purgation, and of the practice of prayer for the dead. They also admit the intercourse of saints, and the lawfulness of invoking them, especially the Holy Virgin Mary, and of honouring their shrines and relics. They do not permit the use of graven images, with the exception of that of the cross; but they freely receive and multiply pictures, which they hold in high honour, and on which they lavish the most costly ornaments of gold, jewels, and other precious things. In their belief of the merit of good works, and especially of fasting, they go even further than Roman Catholics. Besides four yearly fasts—the fasts of Lent, and the Lesser and Great Fasts of Saints Peter and Paul, the fifteen days before Assumption day, and the six weeks before Christmas—they observe the Wednesdays and Fridays throughout the year as fasts. Their liturgy shall be described hereafter (see _Liturgy_); for the present, it will be enough to say that, in spendor of ceremonial, they are not inferior to the Western. Instrumental music, it is true, is forbidden in the churches, but singing is universally in use. In public prayer, the kneeling posture is used only at Pentecost; at ordinary times, they stand, the body being turned towards the east. The use of the sign of the cross is habitual among them. The monastic institution has subsisted in the Greek Church from the earliest times, and numerous convents of both sexes are dispersed over the east, which follow almost exclusively the rule of St. Basil. The abbot is called Hegumenos, the abess, Hegumenka; it is governed by several convenant rules, and is called Archimandrite. Both monks and nuns are bound by vows of celibacy. With both, the duty of manual labour is a leading observance; the nuns, like their Western sisters, apply themselves to the care of the sick, and to the education of young females.

As regards the separate constitution of the three great sections of the Greek Church, it will be enough to say that the independence remained subject to the patriarch of Constantinople, who from the beginning enjoyed a continued but precarious protection from the sultan, and even held, as regarded his own flock, a civil pre-eminence, with the rank of a ‘pasha of three tails.’ But the return for this civil status, the Porte claimed and exercised the right of appointing and also of depositing the patriarch, a right which was habitually exercised as a matter of purchase and sale, and which, though not formally vested in the, candidates for the patriarchate, but in the entire ecclesiastical system. For a long time the metropolitan of Russia (afterwards patriarch) was directly subject to the patriarch of Constantinople, as also the bishop of the modern kingdom of Greece, but both churches are now independent. The patriarch of Constantinople, Jeremias II., in the year 1589, consented to the creation of a separate but dependent patriarch and this dependence continued until the time of Peter the Great, by whom the patriarchate was first suspended, and afterwards abolished, the church being now governed by what is called the Holy Synod, an ecclesiastical commission appointed by the tsar. The independence of the church of the kingdom of Greece dates from the revolution. The ‘organic law of Eupalurus,’ of January 1822, proclaimed the Oriental Orthodox Church as the church of the state, and soon afterwards measures were taken to establish the same in the new kingdom. For a time, the patriarch of Constantinople hoped to preserve his ancient authority; but the president of the new state, Capo d’Istrie, firmly resisted, and, after many preliminaries, the greatest synod, not only in the patriarchate was first suspended, and afterwards abolished, the church being now governed by what is called the Holy Synod, an ecclesiastical commission appointed by the tsar. The independence of the church of the kingdom of Greece dates from the revolution. GREEK FIRE—GREEK RELIGION.

The last remnant of subjection to Constantinople was removed by a subsequent proceeding, when it was resolved that the bishops should no longer seek consecration from the patriarch of that see. The church of Greece comprehends a district of about 890 square miles, and numbers about 800,000 members.

The United Greek Church comprehends those Christians who, while they follow the Greek rite, observe the general discipline of the Greek Church, and make use of the Greek liturgy, are yet united with the Church of Rome, admitting the double procession of the Spirit and the supremacy of the Roman pontiff, and accepting all the doctrinal decisions subsequent to the Greek schism which have force as articles of faith in the Roman Church. The United Greeks are found chiefly in Southern Italy, in the Austrian dominion, in Poland, and in the Russian empire. In Italy, they are computed at 80,000; in Austria, at about 4,000,000; and in Poland, about 259,000. In Russia, it is difficult to ascertain what the number is. As regards nationalities in Austria, they are divided into Romanians and Ruthenians—the former being settled in Wallachia, Transylvania, and Eastern Hungary; the latter, in Little Russia, Galicia, and Moravia, in Austria. The union of the Greek and Ruthenian Christians of Wallachia and Transylvania dates from the end of the 12th century; and although the Reformation made some progress among them, they still for the most part remain true to the union. The union of the Galician Greeks or Ruthenians is of much later date, about the close of the 17th century. It is only necessary to add that the usage of the United Greek Church as to the law of celibacy is, with the consent of the Roman pontiff, the same as among the other Greeks. They are also permitted to administer communion under both kinds.

GREEK-FIRE, a composition supposed to have been of nitre, sulphur, and naptha as a principal ingredient, with which the Greeks of the Byzantine empire were wont to defend themselves against their Saracen adversaries. The accounts of its effects are so mingled with obvious fable, that it is difficult to arrive at any just conclusion as to its power; but the mixture appears to have been highly inflammable, and to have possessed the power of burning under water. It was projected from a tower, tied to arrows, or through a tube, the precursor of cannon. Wherever the combustible fell, it made great havoc, from the inextinguishable nature of the fire. The invention of this material has usually been ascribed to Callinicus of Heliopodania, and the year 668 a.d.; but there seems to be reason to believe that it was rather imported from India. At Constantinople, the process of making Greek fire was kept a profound secret for several centuries. The knowledge, however, of its composition gradually spread; and at the time of the discovery of gunpowder, Greek fire formed a recognised defensive element in most wars from Western Europe to Asia Minor. Subsisting for some time concurrently with gunpowder, it gradually died out before the advances of that still more effective competitor, till now little vestige remains of Greek fire beyond a Norman corruption of its name in our firework ‘crack’; a word derived from ‘Grekke’ of the middle ages, is but a corruption of ‘Greece.’ See also FIREARMS.

GREEK MUSIC. The existence of music as an art or science among the ancient Greeks has for hundreds of years been a subject of inquiry and discussion among the learned. With the restoration of science and arts at the end of the middle ages, the veneration for all that belonged to that people was carried to such an extent, that because we had to thank them for much, many writers thought it must be honourable to them for all. Fortunately, we have handed down to us various dissertations and fragments on music by old writers, which, although they do not unfold to us anything like a satisfactory view of the ancient Greek music, yet sufficiently show us that among the Greeks the art of music was in a very imperfect and incomplete state, and that, in its elements and groundwork, it was entirely a slave to poetry, and can have been little else than a kind of intoned declamation. We hear from ancient writers of the magic influence of music; but we must not forget that they used the word music in a collective sense for the gift of the muses generally; and when they spoke of the elevating and moral effects of music, it is to be understood that they meant a general harmonious cultivation of the arts and sciences. The system of music known to the ancient Greeks, and as practised in their temples and theatres, differed essentially from our modern music, as their scale, or succession of sounds, was not based on the octave and its repetition, but on a fourth and its repetition. Their scale consisted of five tetrachords, each containing four consecutive sounds; the last sound of one tetrachord and the first of the next; while two of their tetrachords had more than one sound in common. In modern music, the ancient Greek scale would be as follows: B, C, D, E, F, G, A; A, B, C, D, E, &c. This they called the diatonic genus, and they had also their chromatic genus, thus, B, C, D, E, F, G, &c., and their harmonic genus, the tetrachords of which consisted of two quarter-tones (which cannot be expressed in modern music) and a major third. It is beyond a doubt that the ancient Greeks neither possessed a system of notation by which their music, such as it was, might have been preserved, nor had they any idea of harmony in the modern sense of the word. Many believe it impossible that a people who have left us specimens of their poetry and sculpture, which, after 2000 years, are still admired as masterpieces, could have been content with such an imperfect and clumsy system of music. Had it been otherwise, it is scarcely possible to imagine that the knowledge of it would not have been handed down to us. An arrow by Pythagoras and a harmonious genus set in modern notation from an old Greek MS., is the whole we possess of ancient Greek music, and those are said by many to be spurious.

GREEK PHILOSOPHY. See PHILOSOPHY.

GREEK RELIGION (Ancient), the most poetical and most humane of all theologies, presents itself in historical times as a plastic worship of nature, with its visible objects and its invisible powers; of abstract notions, sensations, propensities, and actions; of tutelary Numina, household or family gods; and of exalted men or heroes. Composed of such widely discordant elements, this great Hellenic Pantheon offers yet a unity so harmonious and consistent in its minutest parts, that its origin is even more difficult to trace than that of the people itself, which, derived from a conglomeration from a conglomerate of various and barbarous races and tribes was fused in an incredibly short space of time into one great family of equal propensities and of equal gifts. This question of the origin of the Greek religion has indeed been a point at issue from the time of Herodotus to our own. While he, together with many others, pronounced it to be almost completely an importation from Egypt, a strong autochthonous school held it to be the renewal; and these two antagonistic views—the Egyptian and Hellenic, or a more or less modified form, found their foremost
Grecian Religion.

representatives in modern days, in Creuzer on the one side, and Offried Müller on the other. The new and all-important science of Comparative Mythology, however, may be said to have set this point at rest; for it proves almost to demonstration, that the fundamental ideas of the Greek religion are due to the regions north-west of India, the cradle of the main Hellenic stock (see Aryan Race); while subsequent colonists introduced additional gods from Phoenicia, Egypt, and the near Pelasgi, and the like body of personified fancies and ideas begetted by the poets at home, were soon amalgamated into one great system. Yet those foreign elements, as far as differed from him, they are immortal, the Greeks, show in a still stronger light with brilliancy of conception and power of imagination, what harmony and plasticity, had fallen to the share of the inhabitants of Hellea, a land which is itself, by the immense variety of glorious scenery of sea and sky, wood and mountain, river and bay, rock and island, contributed not a little to quicken that immortal youthfulness by which they were so aptly and strikingly called throughout the East. The idea and substance of which Greece, with its intellectual attributes for their humanly shaped gods. But man, the ideal of creation, was deficient in one thing:—the duration of his life was limited—and in this respect he was not like them: they loved and hated, they 'transgressed' and suffered. No ideal moral code existed with the Greeks, the first essentially ethical people though they are; consequently, their gods, when they could not attain the objects of their many and strong desires in a straightforward manner, had unscrupulous recourse to stratagem and cunning, and through their questionable practices, not infrequently brought them the East into very one of the most powerful and most noble, and it was his special province to fulfil the duties of piety and modesty towards them, of righteousness and justice towards his equals. On this condition alone, the unsullied enjoyment of life with all its most glorious incidents, like successions, and passed, with rare exceptions, speedily and irreversibly, on the earth, he trod, not at some future period or in other realms. There was a hereafter, but it was the shadowed way of the next world, a miserable nether world of cheerless twilight. Only for very extraordinary crimes was there something like a real, fearful, and everlasting punishment in store in the Hades, or the still more terrible Tartarus; while, on the other hand, only the most exalted heroes are, after their death, endowed with a new body and enjoy the pleasures of Elysium. But these are very exceptional cases: 'When a man is dead,' says the shade of Anticlea, 'the flesh and the bones are left to be consumed by the flames, but the soul passes away like a dream.'

We cannot attempt here to enter minutely into this vast subject of Greek theology—to trace its historical development from the days when the so-called 'Oirs were invoked. Like the German kinser, the highest god without image or temple, and the minor deities as the 'Great Ones,' the 'Unknown Ones,' the 'Merciful Ones,' without distinct name and shape—to the time when every sound and every sight, every thought and every deed, had a sublime significance, caused and inspired as it was by a god; when the prodigious number of clearly defined, and individually and most sumptuously worshipped gods formed one of the mightiest impulses to the development of the arts; and from that period down to the days when the poets put prophecies of the speedy death of the gods into the mouths of their heroes; when philosophers openly declared 'these superstitions to be the ruin and detraction of the gods and religious persecutions hastened the downfall of a creed which had become adulterated by foreign elements no longer to be amalgamated—until Christianity stepped in, and not satisfied with deposing the gods of Greece, rechristened them, branded them with the names of 'evil powers,' or 'demons,' in the sense of Eastern 'Satans,' to perdition. Much less can we attempt here a minute enumeration and description of all the deities, their genesis and history, with the myths and ceremonial institutions, and in historical times by poets and philosophers, or dwell on the immense influence of Greek religion on other religions, the Christian among them. It is only desirable here to trace a faint outline of the divine commonwealth, and the outward forms of the religious worship of the Greeks, in the so-called classical period. Some account of the principal deities will be found in special articles.

Without entering into the principal division of the gods into heavenly, terrestrial, and maritime, we will briefly mention the supreme council of the twelve national gods, who, together with a vast male and female retinue, dwelt on the heights of Mount Olympus, around its highest peak, Phoebus, looking into the sky (Ouranos), was inhabited by Zeus, the son of Cronus, the highest, mightiest, and wiser being, king and father of gods and men: who watches over all human doings, principally over hospitality and the sacredness of oaths. Second in power is his brother Poseidon, the shaker of the earth, the ruler of the sea and all the waters of the earth. Next stands Apollo, the son of Zeus and Leto (darkness); he is (as Phoebus) the sun, and darts his rays or arrows as god of the chase, as god of destruction, as well as of beneficence. But he is not god only of the physical, but also of the mental light; hence to him belongs the insight into future events. He is the god of oracles, but, as such, equivocal (lorius); further, god of poetical inspiration, song, and music—leader of the muse. He is one of the sublimest figures among the gods. In his love and in his hatred, he is always enthusiasm in a sacred dignity and majestic beauty, even the most ribald fiction stood in awe. The god of the terrestrial fire, which in his person had been thrown from heaven to earth, is Hephaestus. His workshops are volcanoes, where things, to be fancies and marvels by him into artful forms; and as volcanic soul best matures wine, to him was assigned the office of cupbearer of the gods. Aras presides over war. Battles, slaughter, rape, and the doom of cities
are his light. Hermes—originally, perhaps, the symbol of animal generation—appears as patron of the huts. He is the guardian of the roads and the messenger of the gods; he is, moreover, the inventor of the lyre and gymnastics. He is the presiding genius of commerce, and, as such, a knave, even a thief. With Zeus is coupled Hera, his sister and wife—beautiful, majestic, but exacting and quarrelsome. Their most daughter, the beautiful and sprightly goddess of understanding and wisdom—and to the water (Tethygaina); hence also, rivalry with Poseidon.

The two elements, the warm and the moist, giving rise to the fertility of the earth, she is the goddess of the grain and of the crops; she is likewise goddess of war, and presides over female handiwork. Artemis, the twin-sister of Apollo, shares with him the chase and the light: her attributes are a torch and the moon. The Phœnecian goddess Astarte had risen from the foamy waves on the Greek shores as Aphrodite, the Greek goddess of beauty and of every sort of voluptuousness. Her counterpart was the chaste maiden-goddess Hestia, in whom was personified the hearth as the centre of the house and family. From the everlasting fire on her altar, the ancient people supposed some auspicious will to be communicated, and they came there to consult and implore her for the deliverance of their new settlements. The list of the Olympians closes with Demeter or Gaia. She is the goddess of agriculture, and, consequently, of settled institutions and laws.

An almost indefinite number of other gods followed, some of them little inferior in power and dignity to the twelve, and who sometimes, like Dionysus, the god of goat-herds and wine-growers, and others, acted as the special deities of certain classes. We must pass over the names which do not vie with the glory here assigned to the Parnassus, the Gorgons, the Medusa, the Vengeful, the Nymphs, and other daimons—partly primateal local deities, partly deified powers of nature; river, mountain, and forest gods; or personified abstract notions—such as Tyche, Psyche, Hebe, Thanatos, Phobos, Hypnos, Kratos, Bia, and the like conscious or unconscious allegories. Besides these, there is a mob of deities, or rather monsters, begotten by the founts of the earth, and the beautiful daughters of man. They became either, like Heracles (the Phœnecian Melkarth), founders of races, who were thus considered the sires of gods, or patrons of special trades and professions, like Daedalus, the hero of artificers and others. The entire absence of that dark and terrible, essentially Eastern, notion of an evil principle, co-existent with the good, between which two rival powers the world is divided; the unassuming geniality of the Greek nature; the tendency towards humanising the whole universe and its gods, who, again, had not displayed to all themselves with mankind; and above all, the emancipation from an all-ruling divinity by such and such a god, made the Greek religion dogmatically, as well as practically, one of the brightest and most joyous, no less than the mildest and most tolerant, of ancient creeds. The outward as well as the inward worship of the gods was with them purely a personal affair. No mediator stood between the individual and the deity; every freeborn man, woman, and child had the undisputed right to pray and to sacrifice when and where he pleased. The priests consisted in the care of certain sacred property, in providing for the service of the temple, in the performance of certain traditional rites, the recitation of certain ancient formulas handed down to them. The Divinities of the Greek temples were called Divine Will expressed by oracles. The Sacrifices (q. v.), which in earlier days had consisted in the votive offering of a lock, a garland, a tablet, or such simple fruits as were yielded by the soil, gradually, as higher notions of the gods, and as society, became more and more stable and sumptuous, adorned with gorgeous statues, had been erected, grew into splendid feasts, of which the gods were invited to partake, together with those who sacrificed. Of the periodical festivals held in the god's temples, the games, and the sports, the scenic representations and musical contests connected with them, and of their peculiar influence in raising the literature, arts, and philosophy of the Greeks above that of all mankind, we have spoken under Festivals, and we may further refer for particulars to such articles as Dionysia, Panathenæa, Thesmophoria, Eleusinian Mysteries (where also the subject of the Mysteries is touched upon), as also to the headings Olympian, Pythian, Nemian, and other Games.

One of the most characteristic provinces of the Greek cult was that belonging to the muses or divinities. The Greek, looking upon the gods as his supreme protectors, his benefactors, and his enemies, was a little afraid of him, threatening dangers, or, in other words, firmly convinced by his own strong sympathy with nature, that a derangement of his own affairs, however unknown to himself, must produce a corresponding derangement in the natural world. We give some credence to the foreboding significances of natural or 'supernatural' prodigies or signs. The other or space between heaven and earth, would be the principal scene of these revelations; the storms that swept over the sea, the thunder-claps, the flashes that lighted it, the thunder-drums, the earth and the birds that floated in the blue abyss, were all so many divine omens. No less would the gods speak in the offerings immediately addressed to them—in the innermost entrails of the sacrificial animal—in the flame that rose from their altar—in dreams of the night, and strange sounds and portents by day; thus, if in the midst of the assembled people, an ominous animal appeared, they specially dispersed. Yet the oracle is regarded as the half-truth. It naturally be suspected to have more than tolerated such practices, much less could it be supposed that it ever sank to the low level of grovelling imbecility, as was the case in this matter of augury with the Oriental peoples. For, to judge by the astonishment of Xenophon—puts into the mouth of Hector the momentous words: 'One omen only is significant—to fight for one's country.'

The growth of culture did indeed early free the Greeks from the vague awe of everyday phenomena, and the science of numismatics fell accordingly into the hands of the lowest jugglers and soothsayers, believed in only by the herd. But in the same degree, there rose into highest importance another and exalted kind of prophecy—the Oracles (q. v.). In this, the god Jupiter—afterwards principally Apollo, his son, the partaker in his councils—spoke himself: first, in the rustling of leaves, in the waves, in the wind, or by his own immediate voice, as human words. He chose the weakest vessels—women girls, to whom the divine gift was a burden and a pain. The Sibyl herself does not understand who the god says through her mouth; she is unconscious—in a state of somnambulism—of mania. But here the priests step in; they act as interpreters, as prophets, as Evangelides (the progeny of some Evangelis), 'bringers of good tidings. Their influence, socially and politically, increased with the increase of their oracles themselves, especially when these latter, by degrees,
from being casual and unforeseen, became frequent and regular. The richest gifts poured in from all parts, as it grew matter of piety to have recourse to them as tokens of the spirit that had entered into an institution, the importation of which, principally for the unity and consequent rise of Greece as a political power, cannot well be overrated. Besides the oldest oracle—that of Jupiter at Dodona—we may mention that which was counted throughout Greece, those of Didyma, Delos, Asea, Klaro, Larissa, Tegyra, of Trophonius—in a subterranean cavern—and of Amphionaeus, near Oropus, in Attica, where the answers were revealed in dreams. But by far the most famous, and of highest import for the whole nation as such, was that of Delphi (q.v.), where the Amphictyonic council was held; where everything connected with the public worship throughout the country was settled; where, in fact, for a very long time was to be found the real central power of Greece.—Its voice ceased in the days of Julian, called the Apostate.

GReELEY, HORACE, American journalist, was born at New Haven, New Hampshire, January 2, 1811. His father was a farmer of small means; and Horace, after acquiring the rudiments of education at a common school, entered a printing-office as an apprentice, 1826, at East Poultney, Vermont. On the completion of his apprenticeship, he worked for some time as a journeyman printer at various places, and in 1831 he went to New York, where he continued his labours as a journeyman until Jan. 1833. In 1834 he edited the New Yorker, a political and literary weekly paper, and in 1840 he edited The Log Cabin, a weekly paper established to promote the election of Harrison to the Presidency. In 1841 he began the New York Tribune, of which he has ever since been the leading editor. As the columns of the Tribune have ever been open to a candid discussion of all topics of interest to the public, it early became a favorite of the most able writers of the various schools of reform, and Mr. G. was held to have adopted to some extent the social theories of Fourier. Mr. G. was an ardent Whig during the existence of that party, and in 1848 was elected to congress from one of the districts of New York, for the short term. In 1851 he visited Europe, and was chairman of one of the committees of the Great Exhibition. When the first decided steps towards secession were taken by South Carolina, Mr. G. expressed himself favourably, and the peaceful separation in case it should clearly appear that an actual majority of the citizens of the Southern States were in favor of seceding. But, those states having, in violation of all law, seized the forts and other property belonging to the federal government, he has since become a zealous and uncompromising advocate of coercion. In 1860 he published a volume of lectures and essays entitled "Hints towards Reform." Subsequently he issued "Glimpses at Europe," and in 1866 a "History of the Struggle for Slavery Extension or Restriction in the United States from 1787 to 1865."
Young G.'s school education was of the simplest and most limited character; but by his own industry he soon acquired a tolerable knowledge of the principal branches of an English education, including history and mathematics. He made some progress in the study of law; he also early evinced a decided predilection for books treating on the art of war.

On the commencement of the troubles between the colonists and Great Britain, he volunteered as a private (1774); but the following year he was chosen, by the Assembly of Rhode Island, general of the contingent furnished by that colony to the army near Boston. He was made major-general in the continental army in 1776, and accompanied Washing-ton on his brilliant expedition into New Jersey near the close of the same year. He performed a prominent part in the disastrous battle of Germantown (1777), on which occasion his courage and skill 
sent to have been, among the American generals, second only to Washington in military talents and in the important services which he rendered to his country.

GReene, Robert, an English poet and dramatist, was born at Norwich about 1581, or, as stated by some of his biographers, in 1550. He was placed at St. John's College, Cambridge, and took out his degree of A.B. there in 1578. He afterwards traveled in Spain and Italy. On his return, he re-entered the university, and took his degree of A.M. at Clare Hall in 1583. He also appears to have studied at Oxford in 1588. On leaving Cambridge, he proceeded to London, where he supported himself by writing plays and romances. He poured out plays, poems, and novels, ruffled about in the miscellaneous, and now and then graced the stage of the London theatres. He was a member of that select society which has furnished with what might be called a moral purpose, the ornament of English literature.

any record was erected about 1619, by Solomon De Cans at Heidelberg, to shelter orange-trees. The Chinese, however, are not unacquainted with green-houses, and it is not known how long this has been the case. The earlier green-houses were glazed only on the sides; glass roofs were introduced in the beginning of the 18th c., and the arched or curvilinea glass roof, still more favourable to the proper admission of the sun's rays, is an improvement which dates from the early part of the 19th. Heat was at first supplied, when necessary, by hot embers put in a hole in the floor, afterwards by furnaces in the green-house; flues, steam, and hot-water pipes, &c., are more recent inventions. See Heat, Green-house.

The green-house is sometimes made capable of being then removed; more generally, many of the plants are carried out into the open garden. Air is freely admitted into the green-house in fine weather, even during the warmest part of the day, care being taken that the plants are not exposed to frost, nor to ungenial and chilling winds. Green-houses are sometimes painted by Proctor to particular colors of the particular genera of plants, under such names as Heather, Camellia-house, &c. According to the present use of the term, a green-house differs from a conservatory only in the plants being in pots, which are very generally placed on the shelves of stages, having a slope not very different from that of the roof.

GREENLAND, a region of unknown extent northwards, stretches from its southern extremity, Cape Farewell (q. v.), along the Atlantic and Arctic Oceans to the east, and Davis' Strait, Baffin's Bay, and Smith Sound on the west.

Our recent knowledge of the western coast we are indebted chiefly to the late Dr Kane of the United States of America. According to that distinguished navigator, the western coast is sometimes invaded by large ice caps which terminate at Cape Alexander, near lat. 78° 10' N. About one degree more to the north, and about six degrees to the east, an immense glacier, described as the largest in the world, barred all further exploration; and it was only by means of a team of dogs that one of Dr Kane's subordinates reached Cape Independence in lat. 81° 22' N. G., therefore, may fairly be presumed, but has not been positively ascertained, to be entirely distinct from the land on the west side of Smith Sound. Dr Kane has said to have been first discovered about the close of the 9th c. by an Icelandic named Gunbibrn, who named it Hvidsaerk (White Shirt), from its snowy headlands. It first obtained the name G. from another Icelandia, Eric Ranili (the Red), who led either an expedition in 885 or 896, and founded two settlements on the west coast, called the Ostre and Westre Bygd (the east and west colonies). About four centuries afterwards, the Westre Bygd was destroyed by the pestilence, called the 'black death,' combined with the attacks of the aborigines; and a century after this, the Ostre Bygd suffered the same fate. G. was visited, and its west coast explored, by Proctor in 1821, by Scoresby in 1823, and Baffin, the latter having advanced as far as lat. 78° N. (the limit of the inhabited country). In our own times Dr Kane has extended his explorations as far as lat. 82° 30', or within 520 miles of the north pole. The coast appears to be so beset with ice as to be practically inaccessible. The former was explored by Dr Scoresby as far as lat. 74° 30', and two inlets, Scoresby's Sound and Davy's Sound, were discovered running far into the interior. This coast-land is called by the inhabitants of the other districts Lost Greenland. Owing to the great extent of land towards the pole, the climate of G. is colder than that of corresponding latitudes further east—so much so, that in Lapland, lat. 72° N., the temperature is as high as in G., lat. 60° N. From observations made by Dr Kane between September 20 and October 1, in lat. 78° 37' N., long. 70° 40' W., the average temperature throughout the year is 3-2°; from October to April inclusive, -23°; from May to September inclusive, +25°. The greatest degree of cold was -59° in January. The greatest degree of heat was +53° in July, the only month in which the average temperature was above the freezing-point. During the short summer, which in few places exceeds four months (during two of which, June and July, the sun is always above the horizon), vegetation is very rapid, the plants being for the most part the same as those indigenous to the north of Scotland; but of a more dwarfish character, the tall trees not exceeding 18 feet. The melemency of these regions does not affect the animal kingdom (man excepted). The walrus, seal, polar bear, arctic fox, dog, and reindeer abound, and supply the inhabitants with almost all the necessities of life. Many plants have been introduced by the missionaries. The sea swarms with different species of cetacea, such as the orca, mysticus, narwhal, porpoise, &c., and of fish, as the cod, salmon, and herring. Sea-fowl are sometimes also very abundant during the summer, including, besides guillemots, sandpipers, plovers, and grous and are also found. The only mineral which has been found in sufficient quantity for exportation is Cryolite (q. v.), which is found at Arkant, and is largely exported. Near the same locality is a salt-works, in which guano is associated with ores of lead, copper, zinc, iron, molybdenum, and with cryolite, fluor-spar, zircon, and other minerals. Copper-ore is said to be abundant in various parts, and gadolinite, sodalite, tourmaline, along with garnets, jasper, mail-inlay, &c., are often found. G. is supplied with coal from Omenek, one of the colonies of North Greenland.

The most important incident in connection with this bleak region is the settlement, in 1721, of Hans Egede (q. v.), a Norwegian clergyman at Godthaab (lat. 64° N.), and with him a colony of 43 men. The colony was supported by the Danish government till 1731, when the supplies were stopped; but a few years afterwards, a pension of 2000 rix dollars a year was granted to the mission. Since that time the Danes have established thirteen different colonies or factories along the west coast, seven in North G. (north of lat. 67° N.), and six in South G.; the total population of the colonies being about 10,000, inclusive of 250 Danes. The population depends chiefly on the fisheries—the same which have so long attracted so many vessels from Great Britain. The exports are whale and seal oil, and cryolite; the skins of the seal, reindeer, and fox; and eider-down.

The imports are wheat, brandy, coffee, sugar, tobacco, and firewood. In 1847—1849, the imports averaged £13,000, and the exports £17,000. The trade to G. has always been a monopoly in the hands of the Danish government. Each settlement is managed by a trader and his assistant, who are paid by government. The whale-fisheries, which are carried on by the settlers, are also for the benefit of the Danish crown.

GREEN MOUNTAINS, a portion of the Appalachian range. See APPALACHIANS.

GREEN RIVER, a river of North America, and tributary of the Ohio, rises near the centre of the state of Kentucky, and flows through it; first in a westward direction for about 150 miles, passing the Mammoth cave, then north-westward for the
GREEN VITRIOL—GREENSTONE.

rem.inder of its course. It joins the Ohio 9 miles above Evansville, in Indiana, and at its mouth is about 600 feet in breadth. It is upwards of 300 miles in length, and is navigable for small steamers for 200 miles. The lower course of the G. R. abounds in coal.

GREEN VITRIOL, a popular name for sulphate of iron. It sometimes occurs as an efflorescence resulting from a chemical change in iron pyrites or sulphuret of iron, but its quantity is generally small. It crystallises in acute oblique rhombic plates.

GREENOCK, a parliamentary burgh, market-town, and important seaport of Scotland, in the county of Renfrew, is situated on the southern bank of the Firth of Clyde, on a narrow strip of shore, and on the slopes of the hills which form its background, 22 miles west-north-west of Glasgow. It extends upwards of two miles along the shore, and at one place it climbs to a considerable elevation up the face of the hills, which here rapidly attain an elevation of 800 feet or more. In the west, and all over the front of the hills, new and elegant villas are continually being erected. From the rising grounds behind the town, and from the western shore, the view of the opposite coasts of Arran, with the beautiful settlements of the Islay and Mull, with white gleaming villages, and of the Firth stretching away into narrow lochs, and dotted over, especially in summer, with every variety of craft, is exceedingly pretty and beguiling. The most important buildings are the Custom-house, the Exchange, the Watt Monument containing a statue of Watt by Chantrey, a museum, a lecture-room, and a library, the Mechanics' Institute, &c. The harbours of G. have been constructed upon a very large scale, and possess every accommodation for shipping, as dry-docks, &c. A new west-end harbour, which will cost £160,000, is now (August 1862) in process of erection. Its quays can be approached by steamers, and its harbours entered by vessels at any state of the tide. The commerce of G. is chiefly with North America, and the West and East Indies. The trade of the town is mainly in sugar-refining, for which it has 15 establishments (two large refineries), in the manufacture of steam-engines, chain-cables, and hemp-cord; in the manufacture of iron-work; and in soap and salt-making. G. has almost constant intercourse with Glasgow by river or railway, and is the general starting-point for tourists en route for the Western Highlands and isles. It sends one member to the imperial parliament. The tonnage of vessels entered and cleared at the port of Greenock, exclusive of steamers and other river traffic, was—in 1830, 432,562 tons; in 1836, 650,806 tons; and in 1860, 1,165,493 tons. The sugar imported into Greenock was—in 1830, 18,357 tons; in 1840, 22,572 tons; in 1850, 45,815 tons; and in 1860, 74,289 tons. The last return of customs revenue for the year ending March 1862 shows—Greenock, 2,657,524, 96. 3d.; and Glasgow, 4,912,140, 12s. 1d. Pop. (1861) 42,100.

Originally consisting of only a few thatched houses, G. was created a burgh of barony in 1633 (having then a population of less than 2,000), and a parliamentary burgh after the passing of the Reform Act in 1832. The property of the town dates from the Union in 1707, when the opening up of free commerce to America and the West Indies gave an impulse to the trade of the Clyde.

GREENS, the common name of all those varieties of kale or cabbage (Brassica oleracea) which do not bolt, and of which the leaves are used for the table as boiled vegetables; some of which are also called colowort, &c., whilst others, particularly those with curled leaves, as German greens, have no other name than greens or kale. Young unboiled cabbages, and shoots from the stocks of cabbages, are often also called greens, as well as turnip-tops, and other leaves of plants used in the same manner.—The leaves of GERMAN GREENS are very much waved or curled. It is one of the best kinds of open greens. It is either sown in spring, and planted out in autumn, or it is sown in autumn, and planted out in spring.

GREENSAND, the name given to two divisions of the Cretaceous Measures (q. v.). They are so called from the occurrence in some of their beds of numerous small green specks of silicate of iron, sometimes so abundant as to give a green colour to them. The term is, however, far from being descriptive of the various included strata; it must be considered simply as a name. In some districts, especially on the continent, the green particles are entirely absent; and in others, so great is the thickness of the one series in the Lower Cretaceous group, and the other in the Upper. It should also be noticed that the relative importance of the two divisions is very different; the Lower Greensand includes a series of strata belonging to the whole Upper Cretaceous group, of which the Upper Greensand is but a subordinate member.

The Upper Greensand consists of beds of sand, generally of a green colour, with beds and conglomerate masses of calcareous grit, called firestones. The strata on the cliffs of the Isle of Wight are 100 feet in thickness. This formation is supposed to have been a littoral deposit on the shores of the Cretaceous sea. While the chalk was being deposited out at sea, these sands were being laid down along the shore, contemporaneous with the chalk, although they appear inferior to it. Their position would necessarily result from the creta- ceous sea covering the chalk, and then being submerged, the greensand would be covered with the chalk, and would appear as an older and under- lying deposit. The beds of this period are rich in fossils, abounding especially in the remains of sponges, mollusca, and echinoderms.

The Lower Greensand consists of a large series of more or less indurated sandstones and clays, with occasional calcareous beds. They attain a thickness of 800 feet. The sands preponderate in the upper, and the clays in the lower portion of the formation. Some beds of clay of considerable thickness, sometimes as much as 60 feet, are used as fuller's earth. The calcareous stone is a highly fossiliferous band of limestone, locally called Kentish rag, much used for building in Kent and Sussex. The formation was formerly known as the iron sand, because of the sands being cemented together by an abundance of oxide of iron; this gives them a reddish colour. The Lower Greensand contains numerous fossils of mollusca and other marine remains. It is a sea deposit resting on the fresh-water Wealden strata, and showing that at this period the sea made considerable encroachments on the dry land.

GREENSTONE, a variety of trap rock (q. v.), composed of felspar and hornblende, and having
GREENWEDGE.—GREENWICH HOSPITAL.

generally a greenish colour, hence its name. It has a more or less compact structure—the component crystals in one specimen being scarcely discernible with a pocket-lens, while in another they form a coarse aggregate, and specimens exhibiting all the intermediate stages may be found. In the finest they are not so small and compact as in basalt. Its crystalline structure separates greenstone equally from the earthy tufts and the glassy pitchstones. It may become porphyritic from a portion of the feldspar forming the larger distinct crystals. In weathering, the disintegrating greenstone assumes a dark-brown colour, and exfoliates round limited centres, giving the rock an appearance as if it were composed of a number of large boulders.

GREENWEDGE, a name given to certain half-shubby species of *Genista*. See *Genista* and *Broom.—Dyers’ G.* (*G. tinctoria*), a species about one or two feet high, with lanceolate leaves, and terminal spikes of pale-yellow flowers, is frequent in hedges, woodlands, and hilly pastures in most parts of Europe, and in the temperate parts of Asia; and is common in many parts of England, but rare in Scotland and Ireland. Its branches, leaves, and flowers—particularly the leaves—yield a fine yellow dye, chiefly used for wool; its flowers mixed with wood yield a fine green dye. It was formerly in great esteem as a dye-stuff, but others have now almost entirely supplanted it. The leaves and seeds were also formerly used in medicine; the former as a diuretic, the latter as a mild purgative.—*Hairy G.* (*G. pilosa*), a rare native of Britain, but abundant in some parts of Europe, is cultivated in some places, especially in France, as feed for sheep, for which it is very nourishing. Its leaves are particularly adapted for light and sandy soils. It is a slender, branched, tortuous, and procumbent plant, with small pale-yellow flowers.

GREENWICH, a parliamentary borough of England, in the county of Kent, is situated on the right bank of the Thames, at a distance of 5 miles south-east of London. It stands partly on an acclivity, but for the most part on low marshy ground, portions of which are said to belong to the channel of the old Thames. The old streets are in general narrow and irregular, but those more recently built are spacious and handsome. By far the most interesting institution in G. is the hospital. See *Greenwich Hospital*. Among the other more important are the university of Kent, and the Royal Observatory (see *Observatories*), situated in the midst of Greenwich Park, a finely-kept extent of public grounds comprising nearly 200 acres. G. abounds in taverns, and is always a favourite resort of Londoners, but specially so in the ‘whiteheat’ season—from April to August. The town contains extensive engineering establishments in steam-yards, rope-works, and several factories. G., which is also connected with London by railway, is touched at by all the river steamers. Pop. (1861) 139,296.

GREENWICH HOSPITAL, a home for superannuated sailors, is a royal foundation, erected by the munificence of William and Mary, under their letters-patent of 1694. For many generations a royal palace had occupied the site, and had always been a favourite resort of the sovereign. The buildings were sufficiently completed by 1706 (at a cost of £50,000), but the establishment was not formally opened till 1719. By the 1st July 1708, 350 had been admitted; and the income derived from bequests, the original royal grant, and from contributions made under coercion by sailors, amounted to £12,000 a year, half of which was expended in maintaining the seamen, and the remainder in completion of the building. In the reign of George II., the forfeited estates of the Earl of Derwentwater, who had long been attainted of high treason, were granted to the hospital, and were computed at £6000 a year. Up to 1834, a compulsory contribution of 6d. a month was exacted from all seamen, whether of the navy or merchant service, towards the funds of the hospital; but in 1834 the sum of £20,000 from the consolidated fund was substituted.

The present income from all sources is now nearly £150,000 a year, out of which the following officers and pensioners are established: 1 governor, £2500 per annum; lieutenant-governor, £800; 4 captains, 4 commanders, 8 lieutenants, 2 masters, 2 chaplains, a considerable staff of naval medical officers and nurses, and 1600 pensioners. The government of the hospital is vested in five commissioners, appointed by the crown, and holding office during pleasure, who are the Treasurer of the Navy, and the first Commissioner of Woods and Forests, ex-officio, with three other persons. The ex-officio members receive remuneration for their service, but the other members each have £600 a year. The commissioners have a secretary and clerks. The nomination of pensioners rests with the commissioners, who select them from the Royal Navy; but the appointment of the officers is made by the Lords of the Admiralty. The pensioners are lodged, clothed, and fed at the expense of the hospital, and in addition have the following pecuniary allowance for tobacco and pocket money: ward-officers, 6d. a week; petty-officers, 4d.; seamen, 3d. The nurses are usually the widows of sailors who have lost their lives in the service.

Attached to the hospital is a school for the gratuitous education of 800 boys and 150 girls. This establishment is under the superintendence of the same commissioners as the hospital, and with regard to funds, is consolidated with it. The education given is such as to fit the recipients for service in the Royal or merchant navy; and the period during which boys are permitted to participate in its advantages extends from three to four years.

In addition to the in-pensioners alluded to above, about 12,000 old or disabled seamen are assisted in their old age by the Greenwich Hospital, which varies from £3 to £57 a year. These men are distributed throughout the country, and receive their pensions at the hands of the Staff-Officers of Military Pensioners, who superintend their respective districts.

The buildings of G. H. and schools occupy the whole space, with the exception of a roadway, between the Thames and Greenwich Park; and taken together, they constitute a magnificent series of buildings, those composing the hospital being among the finest in the whole kingdom.

The question has been frequently raised of late years, whether this superb charity is not, after all, a mistake, and whether the vast revenues would not be bestowed to better advantage in pensions to seamen, who might still find employment in aid of their subsistence, and who would have the happiness of passing the last days of their lives among their descendants. Under the rules, the hospital is, so far as the pensioners are concerned, a monastery in which hundreds of men live together, without any of the soul-sustaining inducements of domesticity. The old men, who, on the whole, painful objects to contemplate, wrecks from whom no further good of any description is to be expected. Leading lives useless to themselves and to others, their best occupation is to recount,
with the garrulity of age and the boastfulness of self-absorption, the exploits of long ago. Many would prefer to see them in happy country-homes, kept by pensions from absolute want; teaching their grandchildren to delight in the country’s glory, and spreading throughout the land, instead of concentrating in one parish, a knowledge of how England can provide in their old age for those among her sons who serve her faithfully in their prime.

GREENWICH OBSERVATORY. See OBSERVA TORIES.

GREGARINIDÆ. This term was applied by Leon Dufour to designate a group of microscopic organisms belonging to the sub-kingdom Protosoa, which have been discovered as parasites in the intestinal canal in various invertebrate animals, especially insects, arachnids and certain chelae polous worms. They seem to have been first observed by Cavolini in the last century, but the earliest systematic notice of them is that of Dufour in 1828, who gave them their name from the groups in which they occurred.

The form of the body varies: it may be cylindrical, oval, fusiform, or threadlike. It is often marked by indentations or strictures corresponding to the spot where an internal septum divides the organism into two or more segments. In some, a process projects from one end of the body, or there may be two lateral processes, and to these prol ogations minute hooks are attached (see d in fig. 1), by which it is supposed these animals attach themselves to the surfaces on which they are generally found. Anatomically, the G. consist of an extensible transparent membrane enclosing a granular mass, in which we observe a nucleus surrounded by a clear space. See CELLS. These organisms are colourless; their locomotive powers seem very limited; and they have neither mouth nor feet.

On carefully watching them under the microscope, we observe two of them to come in contact. The surfaces in contact become flattened, and a cyst or capsule soon forms around them and encloses them (see f and a in fig. 1). Numerous globular vesicles are then produced in the interior, and these become ultimately metamorphosed into peculiar bodies, which are termed pseudo-navicules (a, e, in the fig.). The septum by which the two G. were first divided, finally disappears; the cyst bursts, and the pseudo-navicule escape, and in due time burst also; and thus gives rise to bodies closely resembling amoebae (fig. 2), minute animals belonging to the Rhizopoda (q. v.), which at length develop themselves into young gregarinids. The coalescence or conjugation of the G. is not positively essential to the formation of pseudo-navicules, since they are sometimes seen to occur within the bodies of single animals.

We have followed, as we believe, the best authorities in placing the G. as adult forms of the group of the Protozoa. There is, however, considerable difference of opinion regarding the position they ought to occupy. Nein places them among the infusoria, Leon Dufour, Leslie, Vogt, and others, place them under various divisions of the worms, while some have even held that they are vegetable forms.

It is exceedingly probable that certain minute parasitic organisms, occurring both on and within the bodies of fishes, and to which the term pseudo-sperm has been already applied, are identical with the pseudo-navicules, which we have already described. The forms of several of these pseudosperms are shown in g in the figure.

The G. have been divided into (1) the Mono cystids, when the animals are solitary; and (2) the Zoomycystids, when two animals are conjoined.

Numerous memoirs have lately been written on the Gregarinidae. We may especially refer to Kulliker’s memoir in the Zeit. f. Wiss. Zoologie (1848), and the Lieberkühn’s memoir on their development in the Mémoires Couronnes des Savants Étrangers, published by the Brussels Royal Academy in 1855.

GREGOIRE, HENRI, the most remarkable among the so-called ‘constitutional’ bishops of France, was born of poor parents at Vebo, near Luneville, December 4, 1756. Having received his education from the Jesuits at Nancy, he entered into orders, and for some time held a professorship at the Jesuit College of Pont-à-Mousson. A work of his, published in 1778, on the Amelioration of the Condition of the Jews, attracted considerable notice. It was translated into English, and crowned...
by the Royal Society of Metz. G. soon after his ordination, was appointed curé of Embermoussy, in Lorraine; and at the election for the States-
generals in 1789, he was chosen one of the deputies of the clergy. An ardent democrat in all his views, he attached himself from the first to the Tiers-État party, and acted a prominent part in the subsequent drama; he was one of the chief advisers of the second estate, and as far as it could be used, took a part in the writing of the rest, and supported the Abbé Sieyes in the proposal for constituting the seeders into the National Assembly, of which he became one of the secretaries. From that time forward, G. pursued his course without hesitation. He was one of the most enthusiastic on occasion of the famous session of the night of August 4, in the abolition and renunciation of the privileges of the nobles and clergy. G. carried into every department the stern democracy to which he was devoted, and which he identified with the Christian brotherhood of the gospel. Upon the fundamental doctrine of the Revolution—the 'rights of man'—he sought to inculcate his own advocacy and the end of the negroes. Carrying the same views into questions of church-polity, he was a zealous supporter of the civil constitution of the clergy, was the first of his order to take the oaths, and was elected the first 'secular bishop' of the French church. He was made Choiseul, constitutional Bishop of Paris, having publicly renounced Christianity, a similar renunciation was demanded from G. by the infuriated rabble, he firmly opposed the danger, and refused. Through the latter phases of the Revolution, under the Directory, G. continued to take a part in public affairs; and to his interference are due many of the measures connected with the public organisation of literature and science, which still bear their fruits in the French system of administration. After the 18th Brumaire, he became a member of the Corps Legislatif. His extreme republicanism was highly distasteful to Bonaparte, and it was only after a third attempt that he was appointed minister of the senate. On the conclusion of the truce between France and England, 1797, and Bonaparte, he ceased to exercise ecclesiastical functions, as he could not be induced to give the retractions which the church authorities required. True to his old principles, he continued every step to the establishment of the abso-
lute authority of Napoleon; and, in 1814, he was one of the first to pronounce against the Empire. On the Restoration, he was one of the most earnest in demanding from the king the acceptance of the constitu-
tion. During 'the Hundred Days,' he attracted no notice; but after the return of the king, he was exiled from the senate, and ceased thenceforth to hold any public place. During this enforced retire-
ment, and in the intervals of leisure in his earlier political life, he published several works, literary, religious, political, historical, and polemical, the most voluminous of which are a Cronique Religieuse, in 6 volumes, and a Histoire des Seicts Religieux, also in 6 volumes, the latter is incomplete. When upon his death-bed, an effort was made by the Arch-
bishop of Paris to induce him to express his regret for the uncanonical and schismatical proceedings of his straw life; but he persistently declined to make any retraction. In consequence of his refusal, the archbishop directed that the last rites of the church should be withheld. Notwithstanding this prohibition, the last sacraments were admin-
istered to G. by the Abbé Guillon, and he died May 23, 1831.
GREGORIAN CHANT—GREGORY.

There cannot be a doubt that Pope Gregory greatly improved the church-music at the time, and that the eight tones have always been ascribed to him. That they are of great antiquity is certain, for we find them mentioned in a treatise on choral singing by one Aurelian in the 9th century. The different character of the Gregorian tones depends entirely on the places of the semitones, which in the above example are marked with a —. Several of the tones have various endings, some as many as four, while the second, fifth, and sixth tones have each only one ending. For a full and interesting account of the Gregorian church-music, see N. A. Jansen's Grundregeln des Gregorianischen Kirchengesanges, published by Schott in Mainz, 1846.

GREGORY, the name of a Scotch family remarkably distinguished, like that of the Bernoullis, in the history of science. Its history goes back to the union in marriage of the Rev. John Gregory, minister of Drumoak, Aberdeen-shire, to a daughter of a David Anderson, who is described by Dr Hutton in his Philosophical and Mathematical Dictionary, as 'of Finzaugh, a gentleman who possessed a singular turn for mathematical and mechanical knowledge.' The most distinguished offspring of this marriage was—

James Gregory, born at Aberdeen in November 1638 or 1639. He studied at Marischal College, after leaving which, he betook himself to optical science, in which he made his first discoveries. At the age of 24, he invented the reflecting-telescope known by his name, and which he described in a work, entitled Opticia Promota. In 1664 or 1665, he went to London with a view to the construction of his telescope; but finding the artists he employed wanting in the skill necessary for grinding the metal for the object-speculum, he passed on to the University of Padua, where he devoted himself to study; and in the year 1667, produced his Finae circuli et Hyperbola Quadratura, followed, in 1668, by two other works, Geometriae Pars Universalis, and Exercitatio Geometrica. These works led him into correspondence with the greatest mathematicians of the age—Newton, Huyghens, Wallis, &c. He was immediately on his return to London, elected a Fellow of the Royal Society, and in 1669 he obtained the professorship of mathematics at St. Andrews, a chair which he filled for about six years. Here, in 1672, he produced The Great and New Art of Weighing Vinas, &c., which bore to the work of M. Patrick Mathers, Archdeacon to the University of St Andrews, the object of which was to expose the ignorance of a Professor Sinclair of Glasgow, who had put a slight on one of the St Andrews professors. In 1674, G., who had in the meanwhile married Mary, daughter of Mr George Jamieson, a distinguished painter, was called to Edinburgh to fill the mathematical chair, which he did for little more than a year. In October 1675, when showing the satellites of Jupiter to some of his pupils, he was struck with total blindness, and a few days after died at the age of 36. For a particular list and account of his works and discoveries, see Hutton's Philosophical and Mathematical Dictionary. Dr Hutton describes him as a man of very acute and penetrating genius, possessing an inventive mathematical genius of the first order; somewhat irresistible in temper; but exhibiting one of the most amiable characters of a true philosopher—that of being content with his fortune.

By his marriage with Mary Jamieson, James G. had a son of the same name, James G., M.D., born in 1674, who became professor of medicine in King's College, Aberdeen, where he founded the School of Medicine. This James G. had two sons, James G., M.D. (the second), who succeeded his father in the Aberdeen professorship; and John G., M.D., who merits particular notice. He was born at Aberdeen in 1724, where he received his early education; afterwards he studied medicine at Edinburgh, Leyden, and Paris. After filling in succession the chairs of philosophy and medicine at Aberdeen, he was appointed, in 1766, professor of the practice of medicine in Edinburgh, where he long enjoyed high reputation as a teacher and practising physician, along with the greatest personal popularity. He was the intimate friend of the most eminent men of Edinburgh in its most brilliant period. He died 9th February 1773. Among his works are—Elements of the Practice of Physic, 1772; A Comparative View of the State and Faculties of Man with those of the Animal World, 1765; and A Father's Legacy to his Daughters (published after his death), 1783. In 1783 his works were collected in 4 vols. 12mo, by Mr Tytler (Lord Woodhouselee), who prefaced them by a life of the author. A Life of him was also written by Mr Smellie. His son, Dr James G. (the third), became distinguished as professor of the practice of medicine at Edinburgh, and a leading man in his profession. He was the author of Philosophical and Literary Essays, 2 vols. 8vo, Edin. 1792. The son of this Dr James was the late William G., professor, at one time, of chemistry in King's College, Aberdeen, and who died April 1838, as professor of chemistry in the University of Edinburgh. William G. was well
known by his works on chemistry, and his edition of the organic part of Turner's Elements of Chemistry; the organic part of which was edited by Liebig. He also translated, 1855, Liebig’s Principles of Agricultural Chemistry. Amongst his contributions to chemistry may be noticed his improved processes for the preparation of hydrocyanic and oxalic acids, his memoir on the preparation of morphia, and on the decomposition products of arsic acid, on the spontaneous decomposition of oxalic acid, on the purification of salt, &c.

We have now to revert to the original stock—the family of the Rev. John G. and Jane Anderson. James G., inventor of the telescope, and founder of the Royal Observatory, and his friends, have just followed, had an elder brother of the name of David—a remarkable man, skilled in medicine, philosophy, and mathematics, and known as David G. of Kinardie—the first man in Scotland who kept a thermometer, a circumstance which, according to Dr Hutton, nearly led to his being tried by presbytery as a wizard. This David had three sons, named respectively, David, James, and Charles. The first of these became Savilian professor of astronomy, Oxford, and died early in life. The second, however, there received the early part of his education, which was completed at Edinburgh. He is supposed to have been disposed to mathematical studies, by having been appointed literary executor of his uncle James, through the telescope—more likely it is that he was so appointed because he had already manifested an aptitude for such studies. With the execution, at any rate, his uncle’s mantle descended upon his person. In his 22d year he was appointed professor of mathematics in the University of Edimburgh, and took, as it were, his lectures in this chair, he had the honour of being the first to introduce the Newtonian philosophy into the schools. In 1691, through the friendship of Newton and Flamsteed, he obtained the vacant Savilian professorship of astronomy at Oxford, for which the illustrious Halley was a competitor. Halley, however, soon after obtained the professorship of geometry in the same university, and became a great rival of his, in the market, and on being struck by their beauty, and learning that they came from a pagan land, resolving to devote himself to the conversion of that land to Christianity. He set forth on his journey, but the claustrum of the Romans at his loss led the pope Benedict to come to his aid. Benedict found him, enrolled him in the secular ministry by ordaining him one of the seven Regional Deacons of Rome. Benedict’s successor, Feligius II., sent G. as nuncio to Constantinople, to implore the emperor’s aid against the Lombards. He resided three years in Constantinople, during which time he commenced, and perhaps completed, his great work, the Exposition of Job. On his return to Rome he resumed his place as almoner, and on the death of Pelagius, in a plague which laid waste the city, G. was unanimously called by the clergy, the senate, and the people to succeed him. He used every means, even to a petition to the Emperor Maurice to withhold his consent, to evade the dignity; but he was forced to yield, and was consecrated September 3, 590. Few pontiffs have equaled, hardly one has surpassed, G. as the administrator of the multiplied concerns of the vast charge thus assigned to him. Nothing, says Dean Milman, ‘seems too great, or too insignificant for his earnest personal solicitude; from the most minute point in the ritual, or regulations about the papal farms in the provinces of Constantinople, to the extremity of simony among the clergy of Gaul, negotiations with the armed conquerors of Italy, the revolutions of the Eastern Empire, the title
of Universal Bishop usurped by John of Constantinople (Latin Chirstianity, i. 439). There is no department of ecclesiastical administration in which he has not left marks of his energy and his greatness. To him the Roman Church is indebted for the complete and consistent organisation of her public services and the details of her ritual, for the regulation and systematisation of her sacred chants. The mission to England, which he was not permitted to undertake in person, was intrusted by him, with all the zeal of a personal obligation, to Augustine; and, under his auspices, Britain was brought within the pale of Christian Europe. Under him the Gothic kingdom of Spain, long Arian, was again to the church. N. was his zeal for the reformation of the clergy, and in purifying of the morality of the church, inferior to his armour for its diffusion. His letters, which are numerous and most interesting, are full of evidences of his careful vigilance. On occasion of the threatened invasion of Rome by the Lombards, G. is declared by Milman to have 'exercised the real power by performing the protecting part of a sovereign, and in his general administration, have been in act and in influence, if not as yet in avowed authority, a temporal sovereign.' Against the memory of his administration of Rome a charge was formerly made, that in his zeal against paganism he had caused the burning of the ancient temples and other buildings of the pagan city; but Gibbon confesses that the evidence is 'recent and uncertain,' and, indeed, the only authority to which Gibbon himself refers, Plutarch, simply mentions the charge in order to repudiate it. The same, according to Milman, may be said of the fable of his having burned the Palatine Library in his hatred of pagan literature, which is now rejected. As regards the general government of the church, G. reproaches very strongly the ambitious, with murmurous and legendary narratives, which, however unchristian in their character, are most interesting as illustrating the manners and habits of thought of that age. G., with all his zeal for the diffusion of Christianity, was most gentle in his treatment of heathens and Jews, and he used all his efforts to repress slave-dealing, and to mitigate the severity of slavery. He died March 12, 694.

GREGORY II., by birth a Roman, was elected bishop of that see in 715. His pontificate is specially noticeable as forming an epoch in the progress of the territorial pre-enimine of the Roman see in Italy. The Eastern emperors having almost utterly abandoned the government, and, still more, the defence of Italy, and their domination of the Lombards becoming every year more formidable, the imperial authority in the West sunk into little more than a name; and the tyrannical and barbarous measures by which the Emperor Leo, the Isaurian, assumed and enforced his degrees against image-worship, weakened still more the tie which bound Italy to the Eastern emperors. The natural result of the diminution of the imperial authority in Italy was the growth of that of the pope, to whom the deserted Italian provinces looked, partly as their spiritual counsellor and head, partly as their mediator with the barbarous enemy, partly as the centre of the political federation for self-defence which their very isolation necessitated. G. convened a council in Rome on the subject of the honour due to images, and addressed a very energetic letter to the emperor, protesting against the sacrilegious outrage, and decisively insisting on the importance of defending the Catholic doctrine on image-worship, and warning the emperor that the feelings of his subjects were so completely alienated by his conduct, that it was only the pope's influence which prevented them from throwing off all allegiance. G. has been accused of himself fomenting this disaffection. The contrary, however, is attested, not only by G.'s own letters, but also by Paul the Deacon, in his History of the Lombards (book vi. c. 29); and it is quite certain that the circumstances of himself, and the well-known character of the emperor, would sufficiently explain any degree of disaffection in Italy. At all events, the result of the contest was a most notable aggrandisement of the authority and influence of the pope in Italy. G. II. died in 731.
Alexander II.—Hildebrand continued to exercise the same influence, and by inspiring into their government of the church the great principles to which his life was directed, prepared the way for the full development of his own theory of the pontificate. This was unanimously elected at Rome, without awaiting the imperial authorisation, three days after the death of Alexander II. The German bishops, who feared personal exactions, proposed to make his name a guarantee, endeavoured to prevent the Emperor Henry IV. from assenting to the election; but Henry gave his approval, and the new pope was crowned. July 10, 1073. From the date of his election, the pontificate of G. was one life-long struggle for the assertion of the principles with which he believed the welfare of the church and the regeneration of society itself to be inseparably bound up. Regarding as the great evil of his time the thoroughly secularised condition of the church in a great part of Europe, and especially in Germany and Northern Italy, he directed against this all his efforts. The position occupied by the higher clergy as feudal prepotents, the right of excommunication with the temporalities of benefices claimed by the crown, the consequent dependence of the clergy upon the sovereign, and the temptation to simony (see SIMONY) which it involved, were, in the mind of G., the great obstacle to the progress of the church. G. menaced, and so all of these he regarded investiture (see INVESTITURE) as the fountain and the source. While, therefore, he laboured by every species of enactment, by visitations, by ecclesiastical letters, and by personal exhortations, persistent efforts were made to enforce the observance of all the details of discipline—censures, the residence of the clergy, the instruction of the people—and to repress simony and pluralism; it was against the fundamental abuse of investiture that his main efforts were directed. In the year after his election, he prohibited this practice, under pain of excommunication both for the investor and the invested, and in the following year he actually issued that sentence against several bishops and councellors of the empire. The Emperor Henry IV. (see HENRY IV.), disregarding these menaces, and taking the offending bishops under his protection, G. cited him to Rome, to answer for his conduct. Henry's sole reply was a haughty defiance; and in a diet at Worms in 1076, he formally declared G. deposed from the pontificate. G. was not slow to retaliate by a sentence of excommunication; and this sentence, if removed by absolution in twelve months, by the law of the empire at the time, was involved the forfeiture of all civil rights, and deposition from every civil and political office. Henry's Saxons subjects appealing to this law against him, he was compelled to yield, and, by a humiliating penance, to which he submitted at Canossa, in January 1077, he obtained absolution from the pope in person. This submission, however, was but feigned; and on his subsequent triumph over his rival, Rudolf of Swabia, Henry resumed hostilities with the pope, and in 1090 again declared him deposed, and caused to be appointed in his place the antipope Guibert, Archbishop of Ravenna, under the name of Clement III. As a result of the change of three years, Henry, in the year 1084, took possession of Rome, G. shut himself up in the castle of St. Angelo. Just, however, as G. was on the point of falling into his enemy's hands, the key remarked by his predecessor, the Duke of Apulia, entered the city, set G. free, and compelled Henry to return to Germany; but the wretched condition to which Rome was reduced obliged G. to withdraw first to Montecassino, and then, May 25, 1085, to die an exile. The character of G., VII., and the theory of church-polity which he represents, are differently judged by the different religious schools; but his theory is confessed by all, even those who most strenuously resist it, as the most grand in its conception, and unanswerable in its object. 'The theory of Augustine's city of God,' says Milman, 'no doubt swam before his mind, on which a new Rome was to rise, and rule the world by religion.' In his conception of the constitution of Christian society, the spiritual power was the first and highest element. It was to direct, to command the temporal, and, in a certain sense, to compel its exercise. But the theory is explained by Evelyn, by Gesellin, and other modern Catholics, the arms which it was authorised to use for the purpose of coercion were the arms of the spirit only. It could compel by penalties, but these penalties were only the consequences of the abuse of power and its corruption. In the case of Henry IV., it was annexed to the censures which had been imposed on the emperor, in the form of a papal bull. The temporal crown was forfeited, according to the Swabian code, by the mere fact of the emperor's remaining for twelve months under excommunication without obtaining absolution from the sentence. Moreover, no length of time seems to have been allowed to Henry to apply the remedy, and the whole sentence was made to extend over a period of years. No sentence is doubtless to be regarded as final, or of the lengths to which it has at times extended, the occasion and the object of its exercise. The methods of G. were always such as to command the sympathy of the philosophical student of the history of the middle age. By his firm and unbinding efforts to suppress the unchristian vices which deformed society, and to restrain the tyranny which oppressed the subject as much as it enslaved the church, he taught his age that there was a being on earth whose special duty it was to defend the defenceless, to succour the succourless, to afford a refuge to the widow and orphan, and to be the guardian of the poor. Dean Milman sums up his history of G. as of one who is to be considered not as a man who was, but some great drawbacks, as a benefactor of mankind.—See Milman's Latin Christianity, vol. iii.; Bowdler's Life of Gregory VII. (1840); Von Schilgen's Heldertum als Papst Gregory VII. und sein Zeitalter.

GREGORY XIII., HUGH BECONOPARPANO, was born at Bologna, January 7, 1656. He was educated in his native city, where he held the professorship of law for several years. Having settled at Rome in 1639, he was distinguished by several important employments, and was one of the theologians of the council of Trent, on his return whence, he was created cardinal in 1654, and sent as legate to Spain. On the death of Pius V., G. was elected pope in 1652. Not one among the post-reformation pontiffs has surpassed G. in zeal for the promotion and improvement of education; a large proportion of the colleges in Rome were wholly or in part endowed by him; and his expenditure for educational purposes is said to have exceeded 2,000,000 Roman crowns. The most interesting event of his pontificate, in a scientific point of view, is the correction of the calendar (see CALENDAR), which was the result of long consideration, and was finally made public in 1652. A grievous imputation rests on the memory of G. from the fact of his having ordered a Te Deum in Rome on occasion of the massacre of St. Bartholomew (see St. Bartholomew). It should, however, be said, that this was done on the report of the
GREGORY NAZIANZEN—GREGORY OF NYSSA.

French ambassador, which represented that bloody event, and it was not a deliberate aggression on the part of the Catholics, but simply as the suppression of a baffled Huguenot conspiracy. G. published a valuable edition of the *Decretum Gratian*. With learned notes. He died in 385, in the 83d year of his age.

GREGORY NAZIANZEN—from his erudition in sacred literature he was called *Theologos,* or *Theologus,* because he was the first Bishop of Cæsarea, near Nazianzus, in Cappadocia, not far from Cæsarea. His father, whose name also was Gregory, and who had originally belonged to the heathen sect of Hypsistatics, i.e., Worship of the Most High, but also of the fire, like the Persians, and keepers of the Jewish Sabbath and the law of the purity of meats, had, chiefly at the instigation of his pious wife Nonna, become a convert to Christianity about the time of the great Nicæan Council (325), and four years later was raised to the dignity of Bishop of Nazianzus. Formed to piety by domestic example, G. was at an early age sent, for the purpose of finishing his education, to Cæsarea, in Palestina, where the study of eloquence then flourished. He then visited the schools of Alexandria, and subsequently of Athens, where he met Basil the Great, then also a young student, and became his most intimate friend. At the same time, there studied at Athens, Julian, his disbelieving contemporary, and there doubtless the three often met and had friendly discussions on the subjects of their common studies; although G., even at that time, augured no good for Julian, who exhibited the signs of an unruled and arro, unseemly mind. O., having made brilliant progress in eloquence, philosophy, and sacred literature, returned to Nazianzus, and here first received baptism at the hands of his own father, consecrating to God, at the age of 16. He, then, all his gods, his glory, his health, his tongue, and his talents; and, in order to be still more able to pursue a life of austere devotion, he retired into solitude, and took up his abode with Basil in the desert near the river Irias, in Pontus. (Recalled by his father, G. was ordained priest, and afterwards fled; and being recalled a second time, he returned to Nazianzus, assisted his father in the ministry, and preached to the people. In 371 or 372, St. Basil, who in the meantime had become Bishop of Cæsarea, prevailed upon him to accept the see of Sesseius, a small town in Cappadocia. But he had scarcely taken possession of his new dignity, when, overcome again by his innate repugnance to public life, he retired, a bishop still, and took up his abode near Cappadocia, where he spent all the years of his life, excepting the last 12 years, during which he resided in Antioch. He then went into a monastery at Seleucia, which, however, after the death of the Emperor Valens (378), he was induced to leave, in order to undertake the charge of a small Nicæan congregation in Constantinople, where, until then, Arianism had been undisputed sway. G. was after a short time, when his erudition and eloquence became conspicuous, elected archbishop, upon which the Arians became so exasperated that his very life was in danger. G., although upheld by the Pope Damascus and the Emperor Theodosius, preferred resigning his see voluntarily, 'in order to lay the storm, like another Jonah, alone on the sea, not excited it. He went back to Nazianzus, and took up his solitary abode near Arianaeus, where, after some years of a most ascetic life, he died in 389. His ashes were conveyed to Constantinople, and then to Rome, and finally to Venice, in the Crusades, to Rome, and finally to Venice. His days, with the Latins, the 9th of May. His character and temper, ardent and enthusiastic, but at the same time dreamy and melancholy, hard, but also tender, ambitious and yet humble, all his industry and application to his work, and the brilliancy and elocution of himself and his writings, which mostly serve the great aim of his life—to uphold the integrity of the Nicæan orthodoxy against the heresies of Arius and Apollinaris. The merits of his writings—which vividly portray the instability and vacillation of his life—are very unequal; sometimes not inferior to the sublime flights of poetical genius, and withal of a classical elegance, but at others, a tedious, redundant, pedantic, and heavy with far-fetched similes. Notwithstanding all this, G. may fairly be pronounced one of the first orators, and most accomplished and thoughtful writers of all times. His surviving works consist chiefly of about 53 orations, 242 letters, and 156 poèmes—meditations, descriptions, acrostics, epigrams, &c., to which Tullius (Utrech, 1696) has added 20 more, which he called *Carmina Cypriorum.* Murator published (Paulus, 1709) 229 other unedited epigrams. The first edition of his complete works appeared at Basel in 1550, folio. Another edition appeared in Paris 1609—1611 (2 vols. folio), by Morel, which was reprinted in Paris in 1630; Leijender (Golague), 1650, 1696, and 1717; and another, 1731—1738, but none of these is sufficiently accurate. The last edition, but little improved, under the auspices of the Benedictines, appeared in 2 vols. (Paris, 1769— 1840). His separate works have frequently been edited, and often translated into different tongues.

GREGORY OF ARMINA, commonly called the *Illuminator,* was the apostle of Christianity among the Armenians. Like the majority of the bishops of the primitive church, little is known of his early history. He is said to have been educated at Cæsarea, in Cappadocia, where, at the same time, he was instructed in the Christian religion. He afterwards entered into the service of Tiridates, king of Armenia, by whom he was subjected to severe persecution on account of his refusal to worship idols. Some severe public calamity which succeeded, being looked upon as a proof of divine wrath, the king immediately put himself and his subjects under G.'s instructions. The people were converted in great numbers, and churches immediately erected throughout the country and abroad, after receiving ordination at Cæsarea, returned as metropolitan of Armenia, and baptised his converts. This took place about the beginning of the 4th century. Many authors have given in their works discourse and conversation by G., but the time becomes spurious. The memory of G. is held in great reverence in the Greek, Coptic, Abyssinian, and Armenian churches, and he is one of the saints of the Roman Calendar.

GREGORY OF NYSSA, SAINT, a Greek Church-father, and the younger brother of Basil the Great, born about 322 at Sebaste, devoted himself to an early age to the study of sciences and philosophy, and subsequently married a pious and honourable lady. In consequence of a dream, however, he separated from her, and abjured the world, entered upon the duties of an ecclesiastic, and after a short time, he was induced to leave Rome and enter into his old profane studies, he renounced this 'apostacy' for ever, and in 372 was made Bishop of Nyssa, a city in Cappadocia, in Lesser Armenia, much to the dismay of the Arians, who knew him to be a zealous defender of the Nicene creed. They at once commenced an opposition to him. G. was deposed by the emperor, and compelled to flee. He lived for some years in seclusion, until, at the death of Valens (364), the Crusades, to Rome, and finally to Venice. In 379, he was charged by the council of Antioch, to visit the churches in Arabia and Palæstine, in order to restore them to their pristine orthodoxy and peace, the many years of heresy and dissension that had been going on. On his return, he lived in great contemplation and confusion among the flock of the faithful. In 381 he was
chased by the council of Constantinople to be one of the 'Centres' of faith for the Catholic communion, i.e., an arbiter of orthodoxy for his and other congregations, principally in Pontus. He further assisted at the councils held in that city in 382 and 383, and played so prominent a part in both, that shortly afterwards the honourable title of Metropolitan was unanimously conferred upon him. The last time (383) he was a member of the council at Constantinople in 384; and he seems to have died shortly afterwards. The second Nicene council conferred upon him the pre-eminent title of 'Pater Patrum.'

His writings are extremely numerous. Although not fraught with the glowing eloquence and penetrating acumen of a Gregory Nazianzen, or a Basil, they exhibit a greater depth of poetical feeling and philosophic thought, while, at the same time, they abound in practical teachings and wise counsels for every stage of life. The fanciful, often puerile subtleties and conceits which occur no less frequently, are rather to be put to the account of this time in which he lived, when allegory reigned supreme. On the other hand, G. cannot be praised too highly for having been one of the first who manfully stood out for the ancient Greek—albeit heathen—philosophy. His writings and discourses, written for political purposes, for the vindication of the Arian heresy, for the refutation of the religion of the heathen, and for the conversion of the heathen, were such as to carry the day at the pagan 'camp,' a saying which, however, has been attributed to some other fathers of the early church. His orthodoxy has been questioned in later times; chiefly on account of his strongly condemning as heretical the view that religion was more a matter of the heart and of feeling. The council of Ephesus solemnly and most energetically declared for the soundness of his teaching, refuting the heretics out of his own writings. Of his Christianology—in the main that of Origen—viz, that the Logos had penetrated all parts of the human nature, and thus elevated it to himself, we will treat under this latter head. The LogosLeft the day of St. Gregory, He was born on the 10th of January, the Greeks on the 9th of March. His most celebrated works are a catechetical treatise, a dialogue of the Soul and Resurrection, called 'Macrius,' after his sister (supposed to have been Origen's wife), a work on the Holy Trinity and the Deity of the Holy Ghost, besides a number of homilies. The first complete Latin edition of his writings, comprising dissertations on the Old and New Testament, dogmatical and controversial treatises, discourses, sermons, panegyrics, biographies, letters, &c., appeared at Cologne in 1537, (folio), and was followed by others at Basel (1562 and 1571), and Paris (1573 and 16/3). The first Greek and Latin editions by the Jesuit Gretzer appeared in Paris (1615—1618), in 2 vols., fol., and was reprinted there in 1638. Separate works of G. have been edited repeatedly, but next to none have appeared in any modern translation.

GREGORY OF TOURS—GREGORY THAUMATURGOS

king of Austrasia. Still very young, he was elected to the see of Tours, and he was consecrated by Giles, Archbishop of Rheims. The first years of his episcopacy were a season of great perplexity, owing to the constant contentions of the first Merovingian kings. His courage and firmness, however, were equal to any of the severe tests to which they were exposed, and by openly resisting even royal authority on some points, the young bishop met the hatred of Queen Fredegunda, and the ire of her husband, King Chilperich, who seems to have been a mere tool in her hands. G. was accused of seditious and other treasonable actions, that summoned to the Aicene council of bishops in 580. Here, however, he defended himself with such clearness and vigour, that Chilperich himself, strange to say, from that moment ceased to be his foe, and becoming even his warm admirer and friend, charged him afterwards with many important political missions. This royal partiality, however, does not seem to have prevented G. from occasionally calling the king a Herod and a Nero. No less favourably by the king's successors, Gontram and Childerich II., G. did not fail to influence with the court for the amelioration of the position of the church, and the general condition of his flock. His travels had, apart from their political purpose, a religious value, as the journeys everywhere restoring peace and piety, so much needed in those days in convents and churches, among the clergy and the laity. Of his journey to Rome in 590, the circumstances of which are related with a vividness and reality, a sense of true piety, are called. The pope's wonder at finding G. instead of the imposing man he had expected to behold, a homunculo, or manikin, and of his answer, that 'we all are as God had made us,' we can only say, that according to the pope's answer. As far as G. the name of the 'Father of Frankish History,' although its crudity of style, and indiscriminate mixing up of everything important and otherwise, make it partake much more of the nature of a chronicle than as a work of a history properly so called. G. has been called: A Book of the Glory of the Martyrs; Of the Miracles of St Julian (304); Of the Glory or Miracles of the Confessors; Of the Miracles of St Martin; and a book of the lives of the Fathers, consisting of 23 biographies of Frankish ecclesiastics, and many other minor writings. Much more, however, is generally attributed to G. than is in reality his. The first critical edition of his works, by Runnard, appeared in Paris, 1629, fol.; the latest, by Guadet and Taranne, Paris, 1830 and 1837, with a French translation. Of monographs on G., we may mention De Greg. Tur. Epsic. Vita et Script. by C. G. Kries and Lobei; Gregor von Tours und seine Zeit (Leip. 182, Svo.).

GREGORY THAUMATURGOS (Wonder-worker), originally called THEODORES, SJD, born at Neocassara, in Pontus, between 210 and 215. Sprung from an illustrious and wealthy heathen family, he was educated for a rhetorician or advocate; but an acquaintance which he formed with Origen at Cassara, in Palestine, allured him to the field of sacred science. G. forgot Roman law, applying himself instead, under his new master, with zeal and fervour to the study of the Holy Scriptures.
and of profane philosophy. Several years had thus passed, when Maximin's persecutions forced Origen to leave Caesarea. G. then went to Alexandria, and stayed there for three years (235—238), but, having succeeded, Maximin, Origen returned to Caesarea, and G. went to join him there, and to renew his former studies under him. Most probably it was at that period also that he was baptised, and changed his heathen name of Theodotus to that of his family G. instead of striving for those posts of honour for which he had been destined, retired into solitude; but was so often besought to return and labour for the church, that he allowed himself, from time to time, to be prevailed on.

Installed as bishop at Neocesarea, a wealthy and populous, but utterly unchristian city, G. applied himself to his holy work with the utmost zeal. He wrought, according to ancient testimony, many miracles, such as recalling devils, whom he had frightened out of a heathen temple, at his will, and thereby converting its chief functionary to Christianity; moving a stone, staying a river, killing a Jew by his mere wish, changing a lake—a matter of two brothers—into solid earth, and thus contrived to change the unbelieving population of his see into devout Christians.

During the persecution of Decius, which broke out in 250, G. fled with a great part of his flock, whereas Voss would not be expected to the danger of having either to change their faith, or to die the death of martyrs, and during this flight, he, once when hard pressed by his pursuers, transformed himself and his deanon—the heathen priest whom he had converted by recalling the devils—into trees. In 251, the Emperor Decius died, and G. returned to Neocesarea. He now instituted a general festival for those Christians who had fallen during the persecution, and permitted the faithful to celebrate it with banquets and sports like those which accompanied heathen festivals—a proceeding by which he intended to draw over the pagan multitude to Christianity, but which has been severely blamed, and which, indeed, was fraught with great mischief for the church in later times.

In 264, we find him, together with his brother Authenodorus, at the Council of Antioch, which had been convened for the purpose of condemning the heresies of Paul, Bishop of Samosata, their signatures occurring first in the Acts of the Council. Whether or not G. also took part in the second council (269), necessitated by Paul's refusal to abdicate his see, is uncertain. Of his piety, devotion, truthfulness, and modesty, of his "prophetic and apostolic temper," the best testimony lies in the fact that St Basil, St Maximus, and other great luminaries of the church, call him a second Moses or Paul.

The only genuine works of G. are a panegyric discourse on Origen, which he delivered in public before his return to his native place; the above-mentioned creed; a Metaphysica on Ecclesiastika, often and wrongly attributed to Gregory of Nazianzus, in twelve chapters; and a Canonical Epistle, setting forth the punishments and penances to be undergone by such Christians as had bought bogt from pagan soldiers, a practice very common in those times. Amongst invasions of Goths and Scythians in Asia, principally in Pontus. All other writings shewn under his name are spurious. The first collected edition of his works was published by Cur. Vossius at Mayence in 1604; a more complete edition appeared in Paris, 1622, in folio.

GREIFFENBERG.—GRENADA.

and is famous for its linen manufactures. Pop. 5478.

GREIFFENHAGEN, a town of Prussia, in the province of Pomerania, is situated on the right bank of the Regitz, 15 miles south-east of Stettin. It is partially walled, has two churches, and is the seat of considerable industry. Pop. 6883.

GREIFSWALD, a town of Prussia, in the province of Pomerania, is situated on the Rick, about 3 miles from its mouth, and 20 miles south-east of Stralsund. It was originally a hanse town, but is surrounded by promenades, into which the former ramparts have been converted. Among its houses are several curious brick structures, dating from the 14th and 15th centuries. G. contains, besides other public buildings and institutions, a gymnasium and a university (founded in 1456), attended by about 200 students. The university library contains about 60,000 volumes. Weaving, machine-making, salt-works, and manufactures of paper, tobacco, soap, leather, and oil are carried on, as well as commerce, to some extent. Pop. 13,880.

G. was founded in the 13th c., before the close of which it made one in a Union of Wendish Hanse towns, comprising Stralsund, Rostock, Wesmar, and Lubek. At the peace of Westphalia (1648), the town came into the possession of Sweden; but, together with the whole of Swedish Pomerania, it was ceded to Prussia in 1813.

GREIZ, a town of Central Germany, capital of the principality of Reuss-Greiz, and seat of the sovereign prince, is charmingly situated on the right bank of the White Elster, 49 miles south-south-west of Leipzig. It is well built, is surrounded by walls, and contains three castles, one for winter, another for summer residence, with beautiful gardens and park; the third, which is built on an isolated rock, is used for public offices. The town-house, a handsome specimen of Gothic, was built in 1841. Nearly 3000 hand-loomes are here employed in the manufacture of woollen and half-woollen goods; one factory contains 500 looms. Pop. 7000.

GRENADA, a maritime province of the kingdom of Spain, and one of the subdivisions of the former province of the same name, is bounded on the W. by the provinces of Cordova and Malaga, on the N. by the province of Jaen, and on the E. by that of Almeria, and on the S. by the Mediterranean. Its area is 4574 square miles, and its population in 1857 amounted to 441,917. Its greatest length from north-east to south-west is 107 miles, and its greatest breadth about 70 miles. The surface is mountainous and picturesque in a high degree. It is traversed longitudinally by two principal ranges of mountains, the Sierra Nevada, toward the south of the province, rising in Mulhacen 11,661 feet in height; and that of Las Alpujarras, which stretches along the coast. The chief rivers are the Jucil, the Barbata, the Guadix, and the Guadalfeo. Of these, only the Guadalfeo finds its embouchure in the Mediterranean. The province of G. is for the most part fruitful and well cultivated. The Alpujarras Mountains contain veins of iron, copper, and lead. Gold occurs here, and brimstone-pits are found; there are also numerous lime and mineral springs, ranging from 93° to 113° F. The ancient territory of G., which, besides the modern province of the same name, comprised also those of Almeria and Malaga, formed, after the Arab invasion, an independent Moorish kingdom. For a time, this country was exceedingly wealthy, having developed great agricultural and commercial resources. From the year 1248 the kings of G. were obliged to recognise the supremacy of the kings of Castile. A quarrel, however, which arose...
between the vassal-king of G. and Ferdinand and Isabella in the 15th c., resulted in a war of eleven years' duration, the consequence of which was, that the kingdom of G. was annexed to the Spanish territories in 1505, and the Moorish dominion finally abolished in Spain.

GRENADA, an island of volcanic origin in the British West Indies, is said to be the most beautiful of the Caribbees. With an area of 138 square miles, it contains about 33,000 inhabitants, mostly of African descent. In 1499, the actual numbers were 410 whites, and 32,261 people of colour; and since then considerable importations of coolies have taken place. On the coast are several good harbours; while a central ridge of mountains, here and there presenting an elevation of 3000 feet, possesses various extinct craters, some of which transformed into considerable lakes. The chief towns are St George, St John, St Patrick, St Andrew, and Charlotte-Town. The first of these, which is the seat of government, stands in lat. 13° 2' N., and long. 61° 45' W. The official returns for 1855 furnish the following information. Besides a grammar-school and a normal school, there were 16 common schools. The public revenue amounted to £17,660, 5s. 6d. The imports and exports were respectively represented by £103,165, 5s. 6d. and £183,613, 1s. 10d.; the corresponding results in 1833, virtually the last year of unmitigated slavery, having been £73,946 and £285,643. The difference under both heads is very significant with reference to the condition of the labouring population.—The island was discovered by Columbus on his third voyage in 1498, at which time it was inhabited by Caribs, who were subsequently exterminated by the French, into whose hands G. came about the middle of the 17th century. It finally fell into the possession of the British in 1783.

GREN'ADE, a small shell, about three inches in diameter, of iron or annealed glass, filled with powder, and thrown from the hand. Hurling among dense masses of troops, as those assembled in the ditch of a fortress during an assault, grenades are particularly embarrassing, the splinters inflicting deep wounds and causing great confusion. The discharge is effected by means of a small time-fuze. Grenades are occasionally rolled into the parapet through wooden troughs, into the trench below; there is also a species of hand-gun fired from a trest, called 'musketon,' from which grenades may be projected to a short distance. These missiles are said to have been first used in the year 1594.

GRENANDER, originally a soldier who was employed in throwing hand-grenades, but in modern parlance a member of the first company of every battalion of foot, in which the tallest and finest men of the regiment are placed. This company is usually distinguished from the rest by tall bearskin caps; it holds the place of honour, viz., the right, when in line, and the front when in column of attack.

GRENADIER GUARDS, the first regiment of Foot Guards in the British Household Brigade of Guards, and generally considered the finest corps in the army. It comprises 2697 officers and men, divided into three battalions. The officers of this fashionable corps are usually from the families of the nobility or more distinguished landed gentry. The First Foot Guards, under which name the regiment was originally known, was first raised in 1660; since then it has ever borne an honourable position in all the wars of the country, and especially in the Peninsula, at Waterloo, and in the Crimea.

GRENADINES, a chain of islets in the West Indies, extending between Grenada, on which they are chiefly dependent, and St Vincent, from lat. 12° 30' to 13° N. They vary in size from about 7000 acres downwards. The largest is Carraicou. Much inconvenience is caused by their deficiency in streams and springs, an evil which, of late years, has been increasingly felt, from the injurious destruction of the timber.

GRENELLE, a suburb of Paris (q.v.).

GRENoble (a corruption of the Lat. Grenobulus, or City of Grouse), an important town and strong fortress of France, with double enclosures, capital of the department of Isère, is pleasantly situated on both banks of the river of that name, in a beautiful and fertile district, surrounded by high mountains, and about 56 miles northwest of Lyon. It is divided by the Isère, which is here confined within handsome quays, into two unequal portions: the one, narrow and contracted, and consisting of only two streets; and on the right bank of the river at the foot of a hill, is called Saint Laurent; the other, a much more important quarter, containing all the public buildings, and consisting of spacious and well-lighted streets, on the left bank, is called Bonne. Among the public buildings are the Palais de Justice, with a Gothic oriel, originally the palace of the Dauphin, and the most interesting old building in the town; the Académie Universitaire; the town-hall; the public library, containing 40,960 volumes; and the picture-gallery of which, though the Carthaginian monks have been greatly enriched, the collection has gained a reputation for its manufactures of gloves, liqueurs, perfumes, and silk goods. Pop. (1857) of town with commune 32270; of town only, 25299.—In the vicinity lies the village of Chartreuse, from which the Carthaginian monks derive their name, and where they originated. See Chapillon Figeac, Antiquités de G. (Gren. 1807), and Pitot, Histoire de G. et de ses Environs (Gren. 1829).

GRESHAM, Sir Thomas, founder of the London Royal Exchange, descended from an ancient Norfolk family, was the second son of Sir Richard Gresham, an opulent merchant, elected in 1537 Lord Mayor of London. Born in 1519, he was first apprenticed to his uncle, Sir John Gresham, a wealthy London mercer, and then sent to study at Gonville Hall, now Caius College, Cambridge. In 1543, he was admitted a member of the Merchants' Company. His father, who died in February 1548, had been one of Henry VIII's domestic financial agents; and in 1552, G. was sent to Antwerp, as king's factor there, in consequence of the mismanagement of the person previously in charge. In two years, he paid off a heavy loan, restored the king's credit, and introduced a new system of finance. The principal duty of the royal agent was the negotiation of foreign loans; and during the long period he held the office, he was successfully employed in many most important and difficult money negotiations.
transactions. As he was a Protestant, Queen Mary, on her accession, sent him his dismission; but on presenting a memorial of his past services, he was soon reinstated. By Queen Elizabeth, he was, in 1559, knighted, and appointed for the time, English ambassador at the court of the king of Spain's regent at Brussels. The troubles in the Netherlands compelled him, in 1568, to withdraw finally from Antwerp, to which city he had made more than one visitation on the previous state, in one of which, in 1560, he was thrown from his horse, and rendered lame for life. In 1569, by his advice, the plan of borrowing money from the London merchants, instead of from foreigners, was adopted, to the great advantage of the mercantile body. Having, in 1564, lost his only son, Richard, he resolved upon devoting a portion of his great wealth to the erection of a bourse or exchange, in imitation of the one at Antwerp, for the London merchants, who were wont to meet in the open air—a project which had originated with his father. It was formally opened, in 1570, by Queen Elizabeth in person, on which occasion he dined with the founder, and named it the Royal Exchange. Renowned for his hospitality and liberality, he frequently entertained foreign personages of distinction, and erected a magnificent mansion at Queen's Park, on a site which was visited by Queen Elizabeth. For the endowment of a college in London, he directed by his will that his town-mansion in Bishopsgate Street should be converted into a residence and lecture-rooms for seven professors, to be salaried out of the Royal Exchange revenues. Gresham College was taken down in 1768, and the ground on which it stood—now occupied by the Excise Office—was transferred to government. The lectures are now delivered in a lecture-hall built at the corner of Basinghall and Gresham Streets out of the accumulated fund. The subjects of lecture are divinity, physic, astronomy, geometry, law, rhetoric, and music. G. also provided for the erection and support of eight almshouses, and made many other charitable bequests. He died suddenly, November 21, 1579.

GRETNA GREEN, originally the name of a farmstead in the vicinity of the village of Springfield, in the parish of Grayton, in Dumfriesshire, Scotland, and afterwards the name of the village of Springfield itself, which is situated about a mile and a half north of the north-eastern extremity of the Solway Firth. The village was long the centre of extensive smuggling operations, and more recently it became famous (and infamous) for its irregular marriages. See next article.

GRETNA GREEN MARRIAGES, the name given to marriages of English persons contracted at Gretna Green. This spot being the first convenient halting-place for runaway couples from England, gave the name to this kind of marriage, originally an easy mode of evading the English Marriage Act, which required the consent of parents and guardians, publication of banns, and the presence of a priest—all of which involved considerable publicity and an inconvenient delay, but which were got rid of by the parties passing the English border into Scottish ground. The rule being, that a marriage is valid if contracted according to the law of the place where the parties entered the pact, it took the form for English couples to avail themselves of the mode of contracting marriage allowed by the law of Scotland, which required nothing but a mutual declaration of marriage to be exchanged in presence of witnesses and performed instantly—and it was immaterial whether the parties were minors or not. This declaration generally took place in presence of a blacksmith, who in reality was no more necessary than any other witness, but who gradually assumed an authority which imposed on the English stranger, and thereby profited by the liberality usually dispensed on such auspicious occasions for his tutoring services. The declaration of marriage being exchanged, the partier clandestinely fled at once to England, and their marriage was held ever after to be valid there and all the world over.

These marriages have received much discouragement of late. Not only has the strictness of the English law been increased by allowing marriages to be contracted in England in comparative secrecy before the superintending registrar, without going before a priest, but the Scotch law has also been altered, with a view of checking this evasion of English law. By 19 and 20 Vict. c. 90, no irregular marriage of that kind in Scotland is now valid unless one of the parties had at the date thereof his or her usual place of residence in England, or had lived in Scotland for 21 days next preceding such marriage. The effect of this statute is, therefore, an obstacle to runaway marriages from England so far, that one of the parties must at least have resided in Scotland 21 days. In all other instances, these marriages may yet be resorted to by English parties, provided the intended husband comply with this requisite, which may easily be done; and it is needless to observe that the difficulty of getting in Scotland, he or she will still have no difficulty in eloping with the other party, for the recent statute will be no obstacle in such cases.

GREY, CHARLES, EARL, K.G., head of the government which carried the Reform Bill, was born March 19, 1754, at Fallowden, near Greenside. The Greys are a Northumberland family of great antiquity, celebrated for military achievements, and first ennobled in the time of Edward IV. The first earl was Sir C. Grey, K. B., a distinguished member of the military profession, who held commands in the first American war, and in the war against the French republic. He assisted in the reduction of the West India Islands, and was aide-de-camp to Prince Edward. He was present at the battle of Fontenoy, where he was wounded. Without the knowledge and against the wish of his more celebrated son, he accepted a peerage from Lord Addington's government. His son was sent to Eton, and thence to Cambridge. He then visited the continent; and in his 22d year entered the House of Commons as M.P. for his native county. He became a follower of Mr Fox, and his maiden speech was in opposition to the address of thanks to the king for negotiating the commercial treaty with France. He soon obtained a leading position in the House of Commons, and was one of the managers of the impeachment of Warren Hastings. He assisted Mr Fox in opening the charge respecting Choyte Sing, and took an active part in all the subsequent proceedings. He was also one of the founders of the Society of Friends of the People, the object of which was to obtain a reform of the representation. In 1793, he was selected to present a petition from this society, in which the defects and abuses of the representative system were forcibly exposed. He supported the prayer of the petitioners in an able speech, in which he deplored what was called by Englishmen the constitutional system of 'representation' as distinguished from the modern abuse of 'nomination.' He was outvoted on this occasion, and again in 1797. In 1798, he opposed the proposal for the Irish union, but recommended forty rotten boroughs in Ireland as a means of securing
the independence of Irish members. When the Whig administration of Lord Grenville came into office in 1806, G., now Lord Howick, became First Lord of the Admiralty, and on 25th September, and was succeeded by G. as Secretary of State for Foreign Affairs, and leader of the House of Commons. The cabinet was broken up in 1807, but not before it had carried the abolition of the slave trade, and the Whigs, that he was, by the decease of his father in 1807, removed from the House of Commons, where he might have led the opposition, to the Upper House, where his advice. The measures of peace and amendment found little response. G. and Lord Grenville, as the leaders of the Whig opposition, were more than once desired by the Prince of Wales, after he became Regent, to coalesce with the Tory ministry, but these overtures were firmly rejected. G. actively opposed the bill of Pains and Penalties against Queen Caroline. During the long period in which he remained in opposition, from 1807 to 1812, he gave a strenuous support to the abolition of the Catholic Bill, on Roman Catholic disabilities, and the amelioration of the criminal code. The year 1830 was a period of great political disorder and discontent. The French revolution had shaken the states and more ardent spirits with the idea of resistance to the government. Nightly conspiracies in the agricultural districts alarmed the timid. When parliament met in November, G. gave warning of the approaching agitation, and the adoption of measures of temperate reform. It was in answer to this speech that the Duke of Wellington made his memorable declaration against reform, and expressed his admiration of the existing system of government. The blow to the Duke’s government. Being outvoted on a motion of Sir H. Parnell’s on the Civil List, the cabinet resigned, and William IV., sent for G., who formed a Whig government, of which he was of course prime minister. The Whigs were in good earnest to clear away the gross abuses and nests of corruption which had accumulated during nearly seventy years of Toryism; above all, a great, comprehensive, and searching measure of parliamentary reform. The bill passed both houses, by a large majority of the cabinet, consisting of Lord J. Russell, Lord Durham, Lord Duncan, and Sir J. Graham. The bill was brought into the House of Commons, March 1, 1832, by Lord J. Russell, and passed the nation. It was, however, fiercely opposed in both Houses. General Gасcоуе brought a resolution against reducing the number of M.P.’s. G. thereupon advised the king to dissolve parliament. The bill, the whole bill, and nothing but the bill,” was the watchword at the elections; and when the new parliament met, the bill was carried through the House by large majorities. The second reading was moved by G. in the House of Lords, October 31, 1832. After five nights, the bill was thrown out by 199 votes against 138. The reply of the House of Commons was an immediate vote of confidence in ministers. The king prorogued parliament, in order that, after the bill was rejected, the internal opposition be agitated again introduced. Riots took place at Nottingham, Derby, and Bristol. At Birmingham, 150,000 men threatened to march upon London. The metropolis was in a fever of excitement. A second Reform Bill passed the House of Commons, which also passed a second reading in the House of Lords, the Tories being determined to mutilate it in committee. Lord Lyndhurst moved the postponement of the disfranchising clauses, and the Whigs being beaten, G. resorted to the extreme remedy of demanding from the king a new and large creation of peers. The king refused his consent, and G. resigned. The popular excitement was increased. The king sent for the Duke of Wellington, but Sir Robert Peel refusing to join the Duke in the attempt to form a government, G. again returned to office, armed with the power of creating as many peers as might be necessary to secure the safety of the bill. On the 4th of June, 1832, the Reform Bill passed the House of Lords, and G.’s friends crowded round him to congratulate him on having crowned his long, honourable, and consistent public career by a measure of such immense advantage and importance. G. took office, the principles of peace, retrenchment, and reform. His government, however, lost a good deal of its popularity in England by his deference to the hostility of the Lords, and his attempt to conciliate his opponents by a division of patronage. In Ireland, Mr. Stanley’s quarrels with Mr O’Connell and the Irish Peers also tended to weaken the government. Many important measures were, however, passed—the measure for National Education in Ireland, the Reform Bill for the Irish Church, and the measures for abolishing slavery in the West Indies. In December 1834, the Grey ministry fell to pieces on the Irish Coercion Act. G. retired from the post of First Lord of the Treasury in the autumn of 1835, and was, until his death, one of the most influential men of the entire nation. A more honourable man never existed. A moral dignity stamped his every action, and over his truthfulness no cloud ever passed. He passed the last ten years of his life in comparative retirement, and died at his family mansion, Howick House, July 17, 1845. His personal appearance was stately and dignified, his gestures were animated, and his tones lofty and sonorous. He left eight sons and four daughters to lament the loss of a most revered public servant.

GREY, LADY JANE, an English lady of royal birth and singular misfortunes, was the eldest daughter of Henry Grey, Marquis of Dorset, afterwards Duke of Suffolk, and Lady Frances Brandon. Lady Frances was the daughter of Charles Brandon, Duke of Suffolk, and of Mary, sister of Henry VIII., who had been married to Louis XII. of France, but had become a widow. Lady Jane G. was born at Broadgate, Leicestershire, in November, 1537. Having above average talents, she was furnished with an excellent tutor, Aylmer, afterwards Bishop of London, and under his care, made extraordinary progress in arts and sciences, and particularly in languages, being able to speak and write Latin and Greek, as well as French and Italian. We have the testimony of Roger Ascham, that he found her reading the Phaedra of Plato in Greek, while the rest of the family were engaged in hunting. She also sang and played well, and was versed in other feminine accomplishments.

In 1553, after the fall of Somerset, the Duke of Suffolk and Northumberland, now ruling in the name of the youthful King Edward VI., and foreseeing his speedy death, determined to change the succession to the crown, and secure it to their own families. Lady Jane G., now 16 years old, was therefore married to Lord Guilford Dudley, fourth son of the Duke of Northumberland, and the king, failing in body, and weak in mind, and surrounded by sordid or fanatical advisers, was persuaded to make a deed of settlement, setting aside the right of succession of his sisters Mary and Elizabeth, and Mary Queen of Scots, leaving the crown to Lady Jane, who was innocent of the conspiracy. After the king’s death, her ambitious relatives hailed her as ‘queen.’ Lady Jane at first shrank from honour so treacherously won, but ultimately yielded.
GREY—GREYHOUND.

The Greyhound is the most popular of all dog varieties. The breed is characterized by its long, slender body, smooth coat, and swift running ability. There are variations in coat color and size, but the breed is generally known for its speed and endurance.

Greyhounds have been used for hunting and racing since ancient times. They were first developed in the Middle East and were brought to Europe by the Pharaohs. The breed was later introduced to the British Isles, where it became popular in the 16th century.

Greyhounds are known for their gentle disposition and intelligence. They are often used as companions and are popular in dog shows. The breed is also used in racing events such as the Greyhound Derby.

Greyhounds were brought to Australia in the early 19th century. They were used for hunting and became popular in the popular culture of the time. The breed is still popular in Australia today and is a symbol of the country's sporting heritage. Greyhounds are also used in the sport of hare-coursing.
coursing,' was imported from France, and improved by further importations from Greece, Italy, the north of Africa, and India. The varieties previously in use were rough-haired, and some of them larger and stronger. The Irish G., now almost if not altogether extinct was larger and more powerful, while wolves existed in Ireland, it was used to hunt them. The Italian G. is a very small and delicate variety, of gentle manners, well known as a drawing-room pet. Greyhounds do not, however, generally show the strong attachment to particular persons common in other dogs; and although so long reduced to the service of man, are inferior to many other dogs in the degree of their domestication. Yet the Grecian and Turkish greyhounds have been trained to stop if a stick is thrown among them when in full pursuit of a doubling hare. A whole pack will thus be stopped, and then one, singled out, will pursue the game.

The fleetness of the G. is well illustrated by an anecdote related in Daniel's "Rural Sports," of a brace of greyhounds in Lincolnshire running after a hare a distance of upwards of four miles in twelve minutes—the increase of distance by turns not being reckoned—when the hare changed pace to a walk.

Various etymologies of the name G. have been proposed, th an which none is more probable than that which refers it to the prevalence of a grey colour in the breeds once most common. Another derivation is from Græus, Grecian. The "gazehound," mentioned by old writers, is supposed to be the G., the name being probably given when a pure breed, hunting by sight alone, began to be introduced.

Greywacke (Ger. Grauwacke), a partially translated German word, used as the name of an indurated argillaceous rock, common in, though not confined to, Silurian and Cambrian strata. The great bulk of the Silurian strata of the south of Scotland is composed of this rock.

Grices, in Heraldry, are young wild boars.

Griesbach, Johann Jakob, author of the first critical edition of the New Testament, was born at Butzbach, in Hesse-Darmstadt, January 4, 1743. While G. was still a child, his father was called to St. Peter's Church, in Frankfurt-on-the-Main, where he was also made consistorial councillor. G. accordingly received his first education at the gymnasium of that city, and afterwards studied theology and law. But the law was not then the still predominant; at Halle, where Semler influenced his whole after-life; and at Leipzig, where he became acquainted with Ernius. Having resolved to devote himself specially to the criticism of the New Testament text, which had become a favourite study among theologians, G. undertook a journey to various libraries of Germany and Holland, to London, Oxford, Cambridge, and Paris. On his return, he published his *De Codice Evangelarum Origina* (1771), and commenced lecturing as Privatdocent in Halle. In 1773, he was made extraordinary professor; but in 1776 was called as ordinary professor to Jena, where he continued to teach with great success, and to draw attention to the many honours, till his death on 24th March 1812. The great work with which his name is associated is his critical revision of the New Testament text. Besides pointing out new sources for the discovery of the original reading of the text, G. endeavoured to set on foot a new course of criticism and investigation of the text (Cura in Historiam Textus Epis. Pauli, 1777), and laying down more certain laws of criticism (Symbole Crisiit ad Supplendas & Corrigendas Varias Lecturas N. Test. 2 vols., 1785—1795). G. was the first who dared to print the New Testament text as he had been enabled to determine it by his critical science. The first specimen of the revised text that he published was the Synopta Evangeliorum (2 vols. 1774—1775; 3d ed. 1809). This was followed, in 1775—1777, by an edition of the whole New Testament, which was published again in 1796—1806, and of which a re-issue was begun by D. Schinz in 1827, but has never been completed. The second edition has been twice reprinted in London, first in 1819, and again in 1818; an American edition was published at Boston in 1808. Besides smaller editions, a splendid one in 4to was published by J. J. Schiede at Leipsig in 1803. G. is the author of the *Populari Dogmatik* (1779; 4th ed. 1789), *Commentarius Criticus in Textum N. Test. (2 vols., 1798—1811), and the *Leccepe Academica* (2 vols., 1824—1825, edited by Gabler), are now less known. A very considerable work, in which G. attempted to establish the correctness of the Greek text, has been brought out by T. Marsh, has pronounced G. to be the most consummate critic that ever undertook an edition of the New Testament. The grand feature of G.'s critical system in his threefold division or classification of the New Testament MS's. These divisions he called 'revisions,' or 'codes.' They consisted of—1. The Alexandrine revision; 2. The Latin or Western division; 3. The Byzantine or Eastern revision. The first of these endeavours to show that the "early Fathers," according to their locality, made use of a particular set of MSS, exhibiting certain peculiarities such as justify the above division. G. expressed his decided preference for the Alexandrine revision, both in regard to antiquity and purity; the Byzantine he considered the least trustworthy. Among the most memorable of G.'s triumphs as a critic is his exposure of the interpolation of the well-known passage in defence of the doctrine of the Trinity, John v. 7. The life of G. has been written by Kühn (Jena, 1812), Augusti (Berl. 1812), and by Eichstadt (Jena, 1815).

Griffin (Fr. Griffin, Lat. and Gr. Grýpp), a chimerical creature, which the fancy of the modern has adopted from that of the ancient. The G. is first mentioned by Aristobulus, perhaps about 560 B.C. (see Liddcl and Scott's *Gr. Dic*), though the accounts of Aristobulus seem to be about as fabulous as those of the Griffin. See Smith's *Dicit. of Gr. and Rom. Mythol.,* where monstrous conceptions in general, of which the G. is one, has already been considered under Dragon (q.v.). The G. is variously described and represented, but the shape in which it most frequently appears is that of a man joined to a lion and an eagle, having the body and legs of the former, with the beak and wings of the latter. In this form it appears on antique coins, and as an ornament in classical architecture. Like all other monsters, griffins abound in the 1st. century tales of the Teutonic nation, and the name in various forms, slightly differing from each other (Ger. Grif, Dan. *Grif*, &c.), is to be found in most Teutonic dialects. Whether in the two cases both the name and the notion might not be traceable to a common source, or whether it was through barbarian or classical channels that they found their way into the nomenclature and the practice of heralds, are questions on which we do not pretend to decide. Certain it is, however, that there are few fabulous conceptions with which the science of heraldry is more conversant than the griffin. Nor were they regarded by the patriarchs of that science always as mere creatures of the imagination, for in whole as it may seem, we find Gerard Leugh, a herald of great reputation in the time of Elizabeth, talking of them with entire sincerity as existing animals. 'I think they are great wild beasts,' says he, 'they have a claw of one of their paws, which should shew them to be as big as two lions.'—See Newton's *Display of Heraldry,* p. 126. In the heraldic G.,
the claws of the eagle are usually substituted for the fore-paws of the lion, the creature being represented as in the accompanying woodcut. Gwllim blazon a G. in this attitude 'rampant', alleging that any fierce animal might be so blazoned as well as a lion. But the more appropriate and usual term is 'Segreant' (q. v.). In representing the G., the ears ought not to be omitted, as they indicate the attribute of watchfulness, which, along with strength and swiftness, went to make up the classical conception of his character. See WIVERN.

The name Griffin, in Natural History, is sometimes appropriated, as by Cuvier, to the genus *Gypsastis*, of which the *Lammeroger* (q. v.) is the best known species; whilst in France it is generally bestowed, under the slightly modified form of Grifon, on the *Tenny Vulture* (*Vultur* or *Gyps fulvus*), also called the G. Vulture or Grifon Vulture, a bird which inhabits most of the high mountainous regions of Europe, as well as those of Northern and Central Asia and of the north of Africa. The men of the south of Ireland in 1843, the only one that is known to have ever found its own way to the British Islands. The G. Vulture is more than four feet in length; it is of a yellowish-brown colour, with darker quills and tail; the head and upper part of the neck covered with short white down, the lower part of the neck surrounded with a ruff of long slender white down. Its habits are very much those common to vultures in general.

**Grillparzer, Franz.** An Austrian dramatic poet, was born at Vienna, 15th January 1796, and first attracted the notice of the public in 1816 by a tragedy, entitled *Die Ahnfrau* (The Grandmother). In 1819 appeared *Sappho*, and in 1822 *Das Goldene Vlies* (The Golden Fleece), which, although they had not much success on the stage, were highly admired as literary productions. The most important of his subsequent works are *König Ottokars Glück und Ende* (King Ottokar's Fortune and End, 1825), a tragedy regarded by some as in many respects the most masterly piece; *Melusine of Vienna*, 1833; *Der Meeres und der Liebe Wellen* (The Waves of Love and of the Sea, 1840), founded on the story of Hero and Leander, and remarkable not only for its particular beauties, but also for the unusual delicacy and simplicity of spirit characterising it as a whole; and *Der Traum im Leben* (The Dream of Life, 1840), a richly poetical drama. He has also written some comedies, and several very beautiful lyric poems, which betray a half-suppressed but genuine love of liberty.

**Grilse.** See Salmon.

**Grimm, Jakob Ludwig.** German philologist and antiquary, was born January 4, 1785, at Hanau, in Hesse Cassel. He was educated in classical and legal studies at Marburg, and afterwards visited Paris, where he pursued a variety of studies, and assiduously cultivated his taste for medieval literature. On his return to Germany, he was appointed secretary to the minister of war at Hesse Cassel, and became successively librarian of Wilhelmshöhe, and auditor to the count palatine of Saar. In 1814, he was secretary to the ambassador of the Elector of Hesse, whom he attended at Paris, and at the Congress of Vienna. In 1815, he was appointed a commissioner by the Prussian government to claim the restoration of mutilated manuscripts, which had been removed to Paris by the armies of Napoleon I. In 1830 he received the appointment of professor of German literature, and librarian of the university of Göttingen. In this position he devoted seven years to the study of the language, ancient laws, history, and literature of Germany. He was one of seven professors who protested in 1837 against the abolition of the constitution by the king. He was also one of the most active in the critical edition of the *Grimm Dictionary*. Since 1841 he has been obliged to retire to Cassel. In 1841 he was appointed to Berlin, where, as member of the Academy, he is entitled to give lectures. He sat as a member of the Assembly of Frankfurt in 1848. Through holding numerous offices of a public character, his life has been devoted to philological and antiquarian studies and works, which are mines of erudition, and the results of a wonderful industry combined with an enthusiastic enthusiasm for everything German. His German Grammar, in four volumes, the first volume of which was published in 1819, and the last in 1837, is perhaps the greatest philological work of the age: it may be said to have laid the foundation of the historical investigation of language. It traces the German language through all its dialects. Some idea of its thoroughness may be got from the fact that the vowels and consonants alone occupy 600 pages. His *Deutsch Sprachfrage* (q. v.), *Deutsche Sprachen* (Language), *Deutsche Sprachkunde* (Language), and *Deutsche Sprachwissenschaften* (Linguistics) of the *Deutsche Sprachgruppe* (History of the German Language), and *Ueber die Ursprache der Sprach* (On the Origin of Language), are also works of great importance. In company with his brother Wilhelm, he has published a numerous works on the national character, the best known of which is *Kinder- und Hausmärchen* (Nursery and Fireside Stories). The greatest joint undertaking of the two brothers (now carried on by J. G. alone) is the *Deutsche Worterbuch*, begun in 1852, and not yet (1862) beyond letter F.

**Grimm, Wilhelm Karl.** Brother of the preceding, was born at Hanau, February 24, 1786. He was the companion of his elder brother at the Lyceum of Cassel, and the university of Marburg. In 1814, he joined the Hanover, for which he was appointed secretary of the librarian of Cassel, and on removing to Göttingen, in 1830, was appointed under-librarian and supernumerary professor of philosophy. He joined his brother in the protest against the king of Hanover, shared his exile, with whom he was at one time in prison, and were commonly known as the Brothers Grimm. Wil. G. died December 1859. Among the works of the younger Grimm are—*Translation of Ancient Danish Heroic Poems of the Sixth Century*; *German Heroic Characters*; *Heroic Legends of Germany*, &c.

**Grimmel, Friedrich Melchior, Baron.** An eminent critic of last century, who, during his long residence in Paris, was on terms of intimacy with the most celebrated personages of the day, was born at Giessen. He was secretary of the librarian of Cassel. Having completed his studies, he accompanied the young Count de Schönberg to the university at Leipzig, and afterwards to Paris. Here he became reader to the crown-prince of Saxe-Gotha, but the political situation of that prince was so precarious, and G. was in very straitened circumstances when he became acquainted with Rousseau. The latter introduced him to Diderot, Baron Holbach, Madame d'Épinay, and other persons distinguished by birth and talents, and he soon became a general favourite. His connection with the Encyclopédistes (q. v., and his multifarious achievements and versatility of mind, soon opened to him a brilliant career. He
became secretary to the Duke of Orleans, and now began to write his literary bulletins for several German princes, containing the ablest analysis of all the most important French works. In the composition of these notices he is believed to have been assisted by the Abbé Raynal, one of the most brilliant of the ancients and moderns. In 1776 he was raised by the Duke of Gotha to the rank of baron, and appointed minister-pleni-

potentary at the French court. On the breaking out of the Revolution, he withdrew to Gotha, and in 1786 the Emperor Joseph appointed him his minister-pleni-potentary at Hamburg, a post which he retained till ill-health obliged him to relinquish it. He returned to Gotha, where he died 19th December 1807. His Correspondance Littéraire, Philosophique et Critique, was published after his death, in 16 vols. A supplement to this is the Correspondance inédite de Grimm et Diderot (Paris, 1829). It contains a complete history of French literature from 1753 to 1790, and is remarkable for its brilliant and piquant criticism.

GRIFFON, a small town of Saxony, in the circle of Leipzig, and 18 miles south-east of the town of that name, is attractively situated on a hollow on the left bank of the Mulde. In the middle ages, its importance as a transit point was much greater than at present, and the flourishing manufactures in cloth, flannel, hose, cottons, and linens, for which at an early period of its history this town was noted, have now almost entirely disappeared. Among the public buildings are the royal castle, now used as a court-house, and the ancient town-hall. Pop. 5500, who support themselves by manufactures and agriculture.

GRIMM'S LAW, the name—derived from the discoverer, J. Grimm (q. v.)—given to the principle which regulates the interchange of the mute consonants in the corresponding words of the different Aryan languages. A historical survey of this family of tongues shows the consonants to be independent of each other, and capable of being indefinitely varied. The following table exhibits the transitions that manifest themselves in regard to the Greek, Gothic, and Old High German:

<table>
<thead>
<tr>
<th>Greek</th>
<th>Latin</th>
<th>Sanscrit</th>
<th>Sanscrit Gothic</th>
<th>Old High German</th>
</tr>
</thead>
<tbody>
<tr>
<td>p b f</td>
<td>t d h</td>
<td>k g ch</td>
<td>k g ch</td>
<td>k g ch</td>
</tr>
</tbody>
</table>

There are of course many exceptions, arising from the influence of adjoining letters and other accidental causes. The following are examples of the law:

- puma—pumae—pumae
- pata—pate—pate
- bapi—beapi—beapi
- tymal—tymalum—tymalum
- terrae—tterra—tterra
- pequa—peque—peque

It is in the High German dialects that the action of this principle is most marked. In the Teutonic tongues of the 'low' type, of which English is one, the consonants have remained at the same stage of development they had attained in the Gothic (e.g. Eng. father, foot, bear, three); the Old High German exhibits a third stage; and in modern High German the principle seems still at work, as some stages of development are here expressed by the crystallising effect of written language.

GRIMSBY, GREAT, a parliamentary and muni-

cipal borough, seaport, and market-town of England, in the county of Lincoln, is situated on the right bank of the Humber, 40 miles north-east of the town of Lincoln. It consists of two portions—the older, comprising a number of streets irregularly laid out, is at the head of the harbour; and the newer part, called the 'Marsh,' extends along the east side of the harbour, and is regular and spacious. The parish church, a good specimen of the English pointed style, is an elegant cruciform structure, with a tower containing eight bells rising from the centre. Among its institutions G. has a free grammar-school, a national school, and other educational establishments; a mechanics' institute and a new town-hall. There are here an extensive and commodious suite of docks, opened in March 1862, and spacious enough to receive the largest ships of war; several ship-building yards, mills, and a tanyard and brewery. G., however, is now chiefly famous for its immense fishing trade. In 1861, 1545 vessels of 322,922 tons entered and cleared from the port. The commerce of G. is benefited by its being the terminus of the Great Northern, and of the Manchester, Sheffield, and Lincolnshire Railways. It sends one member to the House of Commons. Pop. in 1861 of the municipal borough, 11,067; of the parliamentary borough, 15,013.

G. was formerly a port of such importance that, in the reign of Edward III., it sent eleven ships to aid that monarch in his expedition against Calais. But the gradual falling off of trade has reduced it to comparative insignificance. Its present prosperity may be said to date from the beginning of this century, when measures were first taken to improve the harbour.

GRINDELWALD, one of the most beautiful of the high Alpine valleys, at a distance of 35 miles from the city of Bern, is about 12 miles long and 4 miles broad. G. owes its celebrity as a resort for travellers to two great glaciers, branches or arms, as it were, of the immense ocean of ice which covers the Bernese Oberland. The village of G., consisting of a number of widely scattered cottages, with about 3500 inhabitants, is about 3600 feet above sea level.

GRINDING, the operation of shaping any hard substance by rubbing away its surface with a rough stone or with a cutting powder. It is similar to filing, and is used in cases where the surface of the material, or for other reasons, filing is inapplicable. Thus cutting-tools and other steel instruments may be filed before hardening and tempering; but after this, if further abrasion is required, they must be ground. Glass houses and metal specula are ground to shape with emery-powder laid upon a metal tool. Ornamental glass is ground into facets or otherwise by means of stones and lap-wheels. Diamonds and other gems are ground or cut with diamond-dust imbedded in soft iron. When large flat surfaces are required, they are obtained by first working two pieces of the substance nearly flat, and then laying one upon the other, and grinding their surfaces together with sand, emery, or other suitable cutting powder. Plate-glass is flattened in this manner; also surfaces of cast iron where accurate fitting is required, the iron surface being either prepared with a planing-machine, or by being ground on a lathe with a slide-rest. Sockets and other bearings which require to be fitted with great accuracy are usually finished by grinding together. For brass and bell metal powdered pumice-stone is best adapted for such purposes, as it is less liable to imbed itself in the metal, and give it a permanent cutting action upon the bearings.

Dry grinding is the term applied to the grinding
of steel with dry grindstones. Its principal applications are in the grinding of the points of needles and fork, the surfaces of gun-barrels, and in finishing steel-plates. This kind of work produces painful irritation in the throat and nostrils of the men and women who follow it; and although the distressing effects have been very much diminished of late by the introduction of currents of air to carry away the particles of steel, and mouth-pieces of damp cloths by which the evil is not entirely obviated; in some breaches, such as gun-barrel grinding, it is still very great. Besides this evil, the stones used for gun-barrel grinding are very large, and revolve with great rapidity, and occasionally, or the stone breaks while revolving, and large pieces are flung off, endangering the lives of the men.

Another kind of grinding, quite different from the above, is that of crushing and rubbing a substance into a powder. This is performed by revolving the substance between rough stones, as in the common flour-mill, or between rollers, either smooth or toothed, according to the degree of fineness required, or by a heavy stone or iron cylinder revolving upon a smooth plate. Colours are ground in small quantities with a muller and slab. The muller is a heavy piece of stone of somewhat conical shape, which rests on its base upon the slab of stone, and is ground upon the hand, and the flour is mixed with a pasty consistence with the required medium of oil or water, and rubbed between the two surfaces until smooth and impalpable. On a larger scale, iron or stone cylinders revolve on a slab in such a manner that they shall not merely roll but shall also rub upon the surface of the slab. A knife or scoop follows one cylinder and precedes the other, scooping the paste into the position required to come fairly under the cylinder which follows it. In the most delicate work, and to a variety of other substances, are ground in this manner.

**GRINDSTONES.** Flat circular stones made to revolve upon an axis, and used for grinding steel, glass, other stones, &c. They are made of sand stone, or sandstone grit, of various degrees of coarseness, according to the purpose for which they are to be used.

It has been found that a disc of soft iron, revolving at great rapidity, will easily cut the hardest steel. In like manner, silicious minerals, such as agate, onyx, chaledony, Jasper, &c, may be rapidly cut to any shape by means of large grindstones revolving very rapidly. This work is carried out very extensively about Oberstein, in the valley of Nahe, near Mayence, from which most of the agates for brooches, &c, are obtained. The edge of the grindstone comes a short distance through the floor of the workshop; the workman lies face downwards on a strong wooden saddle or bed, and by thrusting his feet against a rest, presses the work with great force against the grindstone, which revolves very rapidly towards him.

**GRIPING, or GRIPES.** A popular name for all painful affections of the bowels, whether attended with Constipation (q.v.) or Diarrhœa (q.v.). When pains of this kind are spasmodic, they are termed Colic (q.v.). The action of purgative medicine is often attended by more or less of griping pain, which may be averted in certain cases by the careful choice of the medicine, or by combination of it with Carminatives (q.v.), or with a little opium.

**GRIPPE,** a French name for Influenza (q.v.).

**GRIQUA,** or BASTAARDS, a South African race who have sprung from the intercourse of the Dutch settlers with Hottentots and Bush women, and whose features bear the marks of their mixed origin. They amount in all to about 15,000, and are partly heathen and partly Christians, the latter being, of course, much superior, both morally and physically. They are peopled on the right bank of the Orange River, and possess a thriving settlement called Griqua Town, 530 miles north-east of Cape Town, which is under the care of the London Missionary Society. They are a hardy and uncivilized G. wear little or no dress, but those converted to Christianity are generally well-clad, and some of them are successful agriculturists and cattle-breeder.

**GRISI, GIULIA,** or OHISELDIS, is the heroine of a celebrated medieval tale, which probably had its rise in Italy. A poor girl, who was a charcoal-burner, was raised to be the wife of the Marquis of Saluzzo, who put her humility and obedience to the severest tests. She, however, which she them all triumphantly, and a reconciliation took place. In this legend, the endurance and self-renunciation of the loving woman are represented as carried to the highest pitch. We find the same traditions worked up into a tale, said to be founded on fact, in Boccaccio's Decameron; Pettrarch translated it into Latin in 1373, under the title De Obedientia, et Fide Exarid; and in the 14th c., the story was well known throughout Germany, where it was worked up into 'Der Gries', a large play in Paris; in England, the drama of The Potent Griesil appeared in 1599, and one on the same subject by Hans Sachs in Germany in 1546.

GRIT.—GROINED VAULTING.

St Gall, and the Vorarburg; on the E. by the Tyrol; on the S. by Lombardy; and on the W. by Grison and Ticino. Its area is 2679 square miles; it contains 150 cantons. The Rhine (860), 91,177, of which 89,0 of G. is Catholics. The canton divides itself naturally into three great valley-districts, of which the first and most important lies along the course of the Rhine, which, after passing northward, occupies nearly the whole of the western portion of the canton; and the second, forming the Engadine (q.v.), extends east-north along the course of the Inn. The third valley-district comprises several smaller valleys whose streams run southward, belonging to the basins of the Ticino and the Adda. The whole canton is an assemblage of mountains intersected by narrow valleys. The climate is very varied, in some districts winter reigns for nearly eight months, while some of these valleys, formed in the Italian Alps, are the scene of snows, and the freezing frost plagues the vine. The valleys, wheat, maize, and also the vine, fig. and almond are successfully cultivated. Pastures and forests occupy a large portion of the canton; and cattle, timber, and cheese are the principal exports. The rivers abound in salmon and trout, and the mountains are still the haunt of the bear, wolf, lynx, and wild-cat.

The country was anciently inhabited by the Rhaetii, who are by some connected with the Etruscans (see ETRURIA). It was conquered by the Roman emperor Constantius in the 4th c., and his camp (Caracalla, or, Caux, the present capital) was planted on the Rhine. Chur has been a bishopric since 430 A.D. In the 9th c. the country of the G. was added to the German empire, and remained till 1268 subject to the Swiss cantons. With the decay of the feudal authority it came to be oppressed by a numerous nobility, the ruins of whose castles still crown the heights. Against them the people began, in the end of the 14th c., to form leagues in the different valleys. One of these leagues, formed in 1424, was called the grey league (Ger. der graue bund; in the native language, lia Griaecho), from the grey homespun worn by the unionists, and hence the German and French names of the canton—Graubünden and Grisons. In 1472, these separate unions entered into a general federation, which then formed an alliance with the Swiss cantons. It was not till 1863 that G. was admitted into the Swiss confederation as a canton. The constitution is very complicated, and suffers from the want of centralisation incident to its origin. Of the inhabitants, one-third speak German, and the others dialects derived from Latin. The dialects of the southern valleys are a kind of Italian; the Latin of the Engadine (q.v.) and the Romanesque differ greatly from Italian, but are far from being Latin.

GRIT is a coarse-grained sandstone, the particles of which are more or less angular, and compacted together by a hard siliceous cement. See MILLSTONE GRIT.

GROAT {Dutch, groet, Ger. groschen, Fr. gros, Italian, grosso, Low. Gross-, from the name of the English great, and meaning thick}, a name given in the middle ages to all thick coins, as distinguished from the 'bracteates' (Lat. bractae, a thin plate or leaf), or thin coins of silver or gold-leaf stamped so as to be hollow on one side and raised on the other. Each groat differed greatly in value at different times and in different countries. The silver groat once current in England (introduced by Henry III.) was equal to four pence. The coin—though not the name—has been revived in the modern fourpenny-piece. Groschen are still current in the north of Germany. The silver groschen, or neugroschen of Prussia and the Zollverein, is 1/4th of a thaler, and worth 14d.; the grotte groschen of Hanover = 1/2 thaler = 4l.

GROATS (also locally grit, from the same root as to grate, to rub to powder; allied to Eng. scratch, and Lat. rubo, to scrape), the grain of oats deprived of the integuments. Groats are much used for preparing gruel for invalids, and were formerly also often used in broths and soups like pot-barley. Embden Groats are groats broken into small pieces by crushing.—Concerning the nutritive and other qualities of groats, see MEAL and OATS.

GRODNO, a government of Russia, in the province of Vilna. It is bounded on the N. by the government of Wilna, on the E. by that of Minsk, on the S. by Volynia, and on the W. by Poland and the province of Bialystok. It has an area of 14,592 square miles, and a population of 881,547, of whom the most are Rhaetii, followed by Poles, and a very small part, 369,103, are Russians. Its climate is dry, and the summers are very warm. The general, flat, and belongs in the south-west to the basin of the Vistula, in the north to that of the Niemen, and in the south-east to that of the Dnieper. In the south, extensive morasses occur, although in many marshy land has been already converted into pasture-ground by draining; and in the north are extensive forests, chiefly of pine. The soil is light and sandy (except that of the river-valleys, which is clayey), and is in general fruitful. Rye is the principal agricultural product, the average annual yield being estimated at 2,346,000 English quarters. Barley, flax, hemp, hops, and timber are also extensively raised. The bear, the lynx, and the buffalo are found in the forests. Cattle, sheep, and hogs are largely reared. The chief branches of industry are the manufactures of cloth, hats, paper, and leather, and the principal exports are corn, cattle, wool, leather, hops, honey, and wax.

GRODNO, a town and formerly a portion of Lithuania, is bounded on the N. by the government of Wilna, on the E. by that of Minsk, on the S. by Volynia, and on the W. by Poland and the province of Bialystok. It has an area of 14,592 square miles, and a population of 881,547, of whom the most are Rhaetii, followed by Poles, and a very small part, 369,103, are Russians. GROG, the name applied in the navy to the mixture of rum and water served out as a beverage to the men. Under recent regulations, men who prefer abstaining from grog are allowed to receive money or tea in lieu thereof. Forced potations of six-water grog, consisting of one part rum to six parts of sea-water, are administered occasionally by way of punishment for dirtiness and some other offences. The quaint name of grog is said to be derived from a nickname of Admiral Vernon, who introduced it into the service. Whether rightly or wrongly, he was in the habit of walking the deck in his Old grog cloak; the sailors thence called him Old- Grog, and thence transferred the name to the drink.

GROINED VAULTING is that kind of vaulting in which the vault is not a plain barrel-vault from end to end, but where one vault cuts into another. The angle formed by the intersection is
GROUMB—GROSBEAR.

called the grain. In Roman architecture, the grain was generally left as a plain sharp edge; in Gothic, they were usually protected and strengthened with ribs. See Vaulting.

GROUML (Lothiaspermum), a genus of plants of the natural order Boraginaceae, having a funnel-shaped corolla, stamens shorter than the corolla, and achenes of stony hardness. Probably, on account of the last-mentioned character, extraordinary virtues were formerlycribed to them, particularly to the Common G. (L. officinale), in the cure of stone in the bladder, which, however, were wholly imaginary. The Common G. is a native of dry gravelly places in Europe, Asia, and North America. It has an erect, much-branched stem, broadly lanceolate leaves, and small greenish-yellow flowers.—Corn G. (L. arenaria) with small white flowers, is more plentiful in Britain, and is of equally wide geographic distribution. Two species, natives of the south of Europe, L. tuctorium and L. anchusoides, yield a dye-stuff similar to alkanet, and which passes under that name.

GROUINGEN (anc. Crooinga), the most north-eastern province of the Netherlands, is bounded on the N. by the North Sea, on the E. by Hanover, on the S. by the province of Drente, and on the W. by that of Friesland. It has an area of 896 square miles, and in 1860 its population amounted to 206,122. It is watered by the Hunse, which is navigable for large vessels from the town of Groningen to its mouth in the Lauwer Sea, by other small streams, and by lakes and numerous canals. Its surface is flat, and is protected against the north by dykes. The soil, which is principally alluvium, forms excellent arable land. The north of the province contains the best soil, and is one of the most densely peopled districts of the kingdom. A considerable portion of the land (towards the south-east) is marshy, and is traversed by canals crossed by 18 bridges. The Hunse is here converted into a canal, and is navigable for large vessels, about 600 of which visit the town annually. The great market-place, said to be the largest in Holland, is 662 feet long and 389 feet broad, and contains the beautiful Gothic church of St Martin's, with a noble tower 343 feet high, the highest in Holland. The university, founded in 1614, possesses a library, a botanical garden, and a cabinet of natural history. The port of G. is good; it communicates by means of canals with Dollart Bay on the east, with the Lauwer Sea on the north-west, and with the entrance of the Zuider Zee at Harlingen on the west. There are ship-building yards and paper-mills. Pop. (1859) 35,519.

GROOÈTLÈ EYLANDT (English, Great Island) lies off the western coast of the Gulf of Carpentaria, in North Australia, and is the largest island in that vast inlet, in lat. 14° S., and long. 136° 40' E. Its extreme length and breadth are about 40 miles each. The centre is mountainous, and the shores are dry and barren.

GROS, ANTOINE JEAN, BARON, a French historical painter, was born at Paris on 16th March 1771, studied in the school of David, and first acquired celebrity by his picture of Bonaparte as the victor of Arcola. The latter was so much pleased with the work, that he appointed G. a member of the commission charged with collecting the objects of art which had been ceded to France by the treaty of Tolentino. His first great achievement, however, was the ‘Pestifère de Jaffa’ (The Plague-smitten at Jaffa), which was executed at Versailles in 1804. It excited prodigious enthusiasm, the author being carried in triumph to the salon of the Louvre, where the picture was crowned in his presence. Other important works executed by G. during the Consulate and the Empire are: ‘Bonaparte aux Pyramides’, ‘Le Combat d'Arbelik’, ‘La Bataille de Wagram’, ‘Charles-Quint reçu à Saint-Denis par François Ier’. After the return of the Bourbons, G. painted, among other pictures, ‘Le Depart Nocturne de Louis XVIII., au 20 Mars 1815’, ‘La Duchesse d'Angoulême s’embarquant à Pauillac’, and ‘Charles X. au Camp de Reims’. Besides these, he finished, in 1824, an immense work for the cupola of the church of Saint-Geneviève in Paris, begun in 1811, to which, say his countrymen, ‘there is nothing comparable.’ It is not a fresco, but a painting executed in oil upon a peculiar kind of plaster, representing the four great dynasties of France doing homage to the tutelary genius of the nation. Charles X. was so charmed with the work, that he raised G. to the dignity of a baron, and doubled the sum which the painter had originally stipulated for. The rise of the romantic school bore away from him the tide of popularity, and G. felt the effect of the profound change that was expected to come. In 1835, he committed suicide in a fit of profound chagrin. At all events, his body was drawn out of the Seine near Monceau, 26th June 1835. G’s paintings are all marked by strength of effect, and dramatic movement in the scene; they are, however, deficient in delicacy and sentiment, and exhibit a very ordinary power of imagination.

GROSBEAR (Cocodravus), a genus of birds of the family Fringiliador, distinguished chiefly by the great thickness of the bill, which has also a proportionate strength, and notwithstanding the small size of the birds, is used for breaking the stoves of cherries, olives, etc. The Hawinich (q. v.) and Greenfinch (q. v.) are the British species, nor are there any others in Europe; but some are found in
GROSENHAIN—GROTES

other parts of the world, as the beautiful Evening G. (F. cespitacea) and the Rose-breasted G. (F. Luddoviciana) in North America.

GROSENHAIN, or HAIN, formerly also called Markgrafenhain, is a small manufacturing town of Saxony, situated on the left bank of the Röder, 20 miles north-east of Dresden. It is famous for its woolen and cotton manufactures. Pop. 6000.

GROSSETETE, Robert, a celebrated English prelate of the middle ages, was born at Stradbrock, in Suffolk, in the latter part of the 12th c. He studied at Oxford, and subsequently at Paris. On his return to England, he obtained a great reputation as a divine, and was the first lecturer in the Franciscan school at Oxford. In 1233, he was elected Bishop of Lincoln, and at once commenced in the most vigorous fashion the reformation of abuses in his diocese. The most conspicuous of offensive ecclesiastical sin in G.'s days, was the conduct of the pope (Innocent IV.) in the matter of church appointments. It was common for His Holiness to make grants of vacant benefices in England to his English subjects, and for others to whom, it would appear, never shewed face in this country at all, but contented themselves with drawing the revenues of their office. This was intolerable to a man like G., and he set himself immediately to redress it, incurring, by a temporary suspension from the exercise of his episcopal functions, and a continual menace of excommunication. One of these transactions in the year 1235 has been the subject of much controversy. It is related by the writers that Innocent wrote to G., ordering his nephew, an Italian youth, to be promoted to the first canony that should be vacant in the cathedral of Lincoln, accompanying his injunctions with threats. The bishop was filled with indignation, and at once addressed a letter either to the pope or his agents, in which he declares, that 'if an angel from heaven commanded him to obey a mandate so absurd and sinful, he would not do it,' and compares the nepotism of the pope to the sin of Lucifer and Anti-Christ. Innocent, according to these writers, was violently enraged at his opposition; he excommunicated G., and even appointed a successor to the bishopric, but not before he had addressed a most weighty and menacing epistle to the pope, in which he calls him a 'Prestes.' G. quietly appealed to the tribunal of Christ, and troubling himself no more about the matter, continued to discharge his episcopal functions. The general feeling of the English nation sustained him in the defence of his clerical duties, not by obeying him as if nothing had happened; and at his death, October 9, 1233, Archbishop Boniface conducted the funeral services. But Dr Lingard (ii. p. 992) has shown that the mandate came not from the pope, but from the nuncio; that Innocent, on receiving G.'s reply, not only rescinded the order, but adopted measures for the reform of these abusive appointments; and that the story of his having died under a sentence of excommunication rests on very questionable authority. G. is commonly regarded as one of the reformers before the Reformation. It is assumed that because he quarrelled with the head of the church on a matter of discipline, he must have been a 'Prestes.' But nothing could be further from the fact than such an assumption. He belonged to that class of minds who look at truth not from the side of doctrine, but that of practical utility. He was not afraid to acquiesce in any new doctrine from the Vatican, but a knavish trick was not to be endured, even at the hands of an angel from heaven! It is in the last degree futile, therefore, to claim him as a precursor of men like Luther, or Calvin, or Knox. In politics, he was a constitutionalist, and a friend of Simon de Montfort, heartily interested in the preservation and extension of such liberty as England then enjoyed. His learning was prodigious, almost inspiring awe among his contemporaries. Latin, Greek, Hebrew, French, mathematics, medicine, and music were among his attainments. His knowledge of the Scriptures is also particularly lauded. G. was one of the most voluminous authors that England ever produced. The list of his works, as given by Dr Pegge, of which only a few have been published, occupies 25 closely-printed pages in quarto. For an intelligent estimate of his life and character, see Mr Brewer's Monumenta Franciscana, and the collection of his letters edited by Mr Luard, and published (1862) under the title, Roberti Grossetetani Episcopi quondam Lincolniensis Epitaphii.

GROSSULARIA. C. E. F. a natural order of exogenous plants, containing about 100 known species, all shrubs, natives of temperate climates, and chiefly of the northern hemisphere. They have alternate lobed leaves. The calyx is 4-5-lobed, the tube entirely or in part adherent to the ovary; the petals are very small, alternate with the segments of the calyx; the stamens are inserted between the petals, and inserted into the throat of the calyx; the ovary is one-celled, with two opposite parietal placentae; the fruit is a berry crowned with the remains of the flower, having numerous seeds immersed in pulp, and suspended by long threads; the testa externally gelatinous, adhering firmly to the horny albumen. The most important species of the order are the Goosberry (q. v.) and Currants (q. v.).

GROSSWARDEIN (Magyar, Nagy-Varad), a town of Upper Hungary, in the province of Bihar, is situated in a beautiful plain, on the Sabes Körös ('the rapid Körös'), 38 miles south-east of Debreczin. It is the seat of a Roman Catholic, and of a non-united Greek bishop, and consists of the town of G. proper, and eight suburbs. The town is surrounded by a wall, and was formerly a fortress. The principal buildings are the churches, of which there are 22, including the cathedral, a magnificent edifice. A great trade is carried on here, especially in wine, in cattle-rearing, and in the cultivation of the vine. The town is connected by railway with Vienna. Pop. with the suburbs, 21,300; without the suburbs, 8100. G. was taken and pillaged by the Turks in 1660, and by the Austrians in 1892.

GROTE, George, politician and historian, was born 1794 at Chayhill, Beckenham, Kent. He is of German extraction, his ancestors having settled in London at the beginning of the last century. His grandfather, in conjunction with Mr G. Prescott, founded the London bank still known by their joint names. G. was educated at the Charter House, and entered his father's bank as a clerk when only 16. In the intervals of business, he studied with unremitting industry. In the year 1825, he began to amass materials for a History of Greece. Being, however, heartily and enthusiastically attached to the cause of progress and political freedom, he threw himself into the agitation for the amendment of the representation which ended in the passage of the Bill of 1832. In December of that year, he successfully contested the city of London as a radical reformer, and continued to represent the city until his voluntary retirement in 1841. In parliament he became the champion of both the ballot, and his annual speeches on behalf of secret voting are believed, by the friends of the ballot, to have remained unanswered to this day. After an honourable and consistent parliamentary career, he retired...
GROTESQUE—GROTIUS.

In political life, in order to devote himself to his History of Greece, G. proposed, in his own words, 'to exhaust the free life of collective Helos, and he is allowed on all hands to have nobly accomplished his task. The compliment which he pays to others may safely be applied to himself, and it may be said of his History of Greece (12 vols. Lond. 1846—1856), that 'the poets, historians, orators, and philosophers of Greece have been all rendered both more intelligible and more instructive to the student; and the general picture of the Grecian world may now be conceived with a degree of fidelity which, considering our imperfect materials, is curious to contemplate.' His views of Greek, and especially of Athenian politics, are by some supposed to be unduly tinged by his English notions and feelings, and many will think him less eminent as a political or historical philosopher than as an historian. The style is sometimes complained of as dry and unattractive; but his History, with all its defects, is a noble monument of erudition and genius, and beyond all question the best History of Greece extant. G. has also written some pamphlets on questions of the day, and contributions to the reviews on classical subjects.

GROTESQUE, a style of classical ornament, so called, in the 13th c., from its having been rediscovered in the excavations made in the baths of Titus and other ancient Roman buildings, the Italian word *grutto* applying to any subterranean chamber. This light, fantastic style was much in favour during the Renaissance. It abounds in all its modifications of the ornamental use of the animal, and mingles all the natural kingdoms in the most fanciful and picturesque confusion. The name grotesque thus came by degrees to mean a fanciful combination of natural ideas as applied to ornament. Thus, all the picturesque animal and vegetable *inventions* of the medieval artists are grouped in this style; some of these are very beautiful, and others very picturesque, and, generally, an idea of some value, such as boldness, fierceness, dignity, &c., is expressed. In this mode of application, the grotesque is a valuable quality in art; it is only when it becomes debased, as in the monstrousities of the Renaissance, that its value is lost.

GROTIUS, Hugo, or Dr Groot, was born at Deltt, 10th April 1583. His father, Jan de Groot, was burgomaster of the town, and also curator of the university of Leyden. In his 11th year he entered the university of Leyden, where he enjoyed the advantage of studying under Joseph Scaliger. In his 15th year he took his degree. In the following year he accompanied Olden Barneveldt, the grand-penury, on his embassy to France, where, notwithstanding his extreme youth, his talents and conduct gained him the favour of Henry IV. On his return, he began to practise as a lawyer; and in 1607 was appointed fiscal-general, and in 1613 council-pensionary at Rotterdam. But the disputes between the Remonstrants and their opponents were now at their height in Holland; Olden Barneveldt had the misfortune to be the protector of the former, and G. also supported them by his writings and favour. These religious, or rather theological strifes had, however,
GROTTA DEL CANE—GROUND RENT.

languages, and remarkable for its clear arrangement, vigorous logic, and eloquent style. It is reckoned the best 'apology' for Christianity in modern times.

—Compare Butler, Life of Grotius (London, 1820); De Vries, Huig de Groot en Maria van Reijjdorpere (Amst. 1827); Grooter, Luther and Hugo Grotius (Heidelberg, 1846).

GROTTA DEL CANE, or GROTTO OF THE DOG, is a noted cave near Naples, in the vicinity of Lake Agnano and of Fuzzoli. It is about 10 feet deep, 4 feet wide, and 9 high, and is so full of carbonic acid gas, especially near the floor, that little animals introduced into it soon die, and tapers placed near the ground are extinguished. This cave was known to the ancients, and is described by Pliny. It derives its name from the practice of introducing small dogs, which are soon almost deprived of life by the gas, but recover if quickly plunged into water.

GROTTAGLIE, a town in the south of Italy, province of Taranto, about 12 miles north-east of Taranto. Pop. 7,499. It takes its origin from the 10th c., when the inhabitants of several surrounding villages, that had been lased in ruins by the Longobards and Saracens, sought refuge here, and gave the name of G. to their new dwellings, from the grottoes which had formed the hill at the foot of which the town stands.

GROUND, in Painting, the coating or preparation put on the surface of the panel, board, or canvas on which a picture is to be painted. Artists attach great importance to the colour and texture of the ground, and tending in no small degree to affect the technical quality of the work. In forming an opinion on paintings by old masters, the kind of ground used is always taken into consideration, for in different epochs and schools, particular grounds were used. The works of the Italian school preceding and during the time of Raphael were all painted on white grounds, and almost always on panels, even when the works were large, and many pieces had to be joined. The preparation was composed of gesso, plaster of Paris, or chalk mixed with size, and the ground was of course absorbent. Afterwards, when canvas came to be generally used, the works of the Italian and Spanish schools were generally painted on a red ground, and that of red colour; and when this was not covered by the artist with a thick impasto or body of paint, the picture was apt to become black and heavy, a fault very marked in the works of the school of Lorenzo Ghiberti and of early masters. The works of the Dutch and Flemish masters, which are distinguished for brilliancy and transparency, were painted on light grounds, varying from white to grey, and their practice is generally followed in this country and in the modern schools abroad. The term ground is also applied to different parts of a picture, as the foreground, or portion of the picture on which are placed the figures or objects represented as nearest the spectator; background, the part of the picture, behind or on which it is intended to set off or relieve the head, figure, or group depicted. The portion of a model or carving from which the figures are projected, is styled the ground.

GROUND-ANNUAL, in the Law of Scotland, is a rent not in issue paid by the owner of land to a creditor or to the vendor of the land, and is most respects corresponds to Ground-rent (q.v.) in England, though the parties stand in a converse relation. It also resembles a Rent-charge (q.v.) in England, with a like distinction. Thus, when a vendor sells his land, and instead of taking a sum for the price, prefers a sum by way of a perpetual annuity or rent, he conveys the land in fee to the dispose or purchaser, subject to this ground-annual, which is a burden on the lands for ever after. The vendor or creditor is then called the ground-anualer, and if the ground-annual is not paid, he is entitled as a master remains of the land, i.e., seize all the goods, whether of the owner or his tenants, which are found on the lands, and pay himself, or he may sue the debtor. But he cannot, as a ground-landlord can do in England, point the goods of the debtor's tenants to a greater extent than the current term's rent or arrears due by them.

GROUND DOVE AND GROUND PIGEON are names given to those birds of the family Columbidae which in characters and habits approach most to the ordinary gallinaceous type. They have short and rounded wings, with much inferior power of flight to pigeons in general; their legs are longer, and their feet rather adapted for walking than for grasping. They are little arboreal in their habits, but live mostly on the ground. Many of them run very quickly. They have not in general much brilliancy of plumage, but among them are the beautiful Bronzewing (q.v.) of Australia.

GROUND-IVY (Glechoma hederaecea, united with the genus Creutzia by some) is a creeping or semi-creeping herb, introduced in England, from the Alps, where it is called Creutzia (Glechoma), a plant of the natural order Labiatae, a common native of Britain and other parts of Europe, growing in waste places, plantations, hedges, &c., in a dry soil. It has a creeping stem, kidney-shaped crenate leaves, and axillary blue flowers growing in threes. The flowers have four ascending stamens, two long and two short, a 15-nerved 5-toothed and equal calyx, the anthers before bursting approaching in pairs and forming a cross. A tea prepared from the leaves is in great repute among the poor in many places, and the plant is stimulant, aromatic, and of use in pectoral complaints. The leaves were formerly used in England for clarifying and flavouring ale, which was then called Gill-ale or Gell-ale, from Gill or Gell, an old name of this plant; but this use has been discontinued since the introduction of hops.

GROUND-NUT, a term variously employed, to denote the seed of the Arachis hypogaea (see ARACHIS), and the numerous allied umbelliferous plants, also called EARTH-NUTS (q.v.).

GROUND-RENT, in the Law of England, is the rent which a person, who intends to build upon a piece of ground, pays to the landlord for the use of the ground for a certain specified term, usually 99 years. The usual arrangement between the owner of the freehold of land and a speculating builder, is of this kind. The builder pays a certain annual sum by way of rent to the owner, who is thereafter called the ground-landlord, and then commences to build upon the land. The builder then lets the houses, and in doing so of course includes in the rent which he pays upon each house a proportionate part of this ground-rent, which he himself is bound to pay to the ground-landlord, so that practically the tenant pays the ground-rent, and the landlord, the latter being so called because it issues out of the ground, independently of what is built upon it. Ground-rents often form a safe investment for capital, because the security is good. This security consists in the ground-landlord being able, whenever his ground-rent is in arrear, to distrain all the goods and chattels he finds on the premises, to whomsoever they may belong; and so the holder of a small sum, compared with the furniture of the tenant, he is always sure to recover its full amount. This power of distress exists whether the tenant has paid his rent to his
GROUND SQUIRREL—GROUSE.

We read or not; but if at any time the tenant has been obliged to pay the ground-landlord the ground-rent, which it is the duty of his own landlord in general to pay, he may deduct such sum from the next rent he pays, or, as it is called, may set off the one against the other so far as it will go. Strictly speaking, there are thus two landlords. The ground-landlord is the over-landlord, and has the paramount security; the other landlord is landlord to the tenant who actually occupies, but is himself tenant to the ground-landlord, for he merely holds a lease. He is what is called a mesne landlord. At the end of the 99 years, or whatever other term is fixed upon, the whole of the building becomes the property of the ground-landlord, for the interest of the builder or his assigns then expires by effluxion of time; and as the building is a fixture, and cannot be carried away, it thus falls in to the landlord, and often thereby creates a great accession of wealth.

Ground-rent corresponds to feu in Scotland, with this difference, that the feu-rent in the latter case lasts for ever, there being no definite term fixed for its ceasing.

GROUND SQUIRREL (Tamias), a genus of rodent quadrupeds of the Squirrel family, differing from the true squirrels in the possession of cheek-pouches, in having a more slender body and shorter legs, and in other less important particulars; but most of all in their habits, residing chiefly on the ground, and seldom ascending trees to any considerable height. They are of small size, are all longitudinally striped on the back and sides, are extremely active and restless, and emit a peculiar

made generic distinctions. Several species having these characters are found in the Ganges.

GROUNDSSEL, the common name of those species of Senecio (q.v.) which have small heads of flowers with a substitute of ray or with the ray itself

back. The Common G. (S. vulgaris), one of the most plentiful of weeds in waste and cultivated grounds in Britain and most parts of Europe, is usually destitute of ray. It is a coarse-looking annual, with tufted leaves of a last high, rounded, pinnatifid leaves, and small yellow heads of flowers; flowering at all seasons, even in winter, when the weather is mild; and its seeds, like those of other Compositae, are widely diffused by means of their hairy pappus, being wafted about by the wind. It has a rather disagreeable smell; but birds are very fond of the young buds and leaves, and cage-birds are fed on them. It has a saltish taste, whence its name. Its leaves, beaten into a coarse pulp, and externally applied to the stomach, cause vomiting some hours after their application; it also makes a good poultice for boils and sprains. The other British species are weeds of very similar appearance, but are stronger, have a more disagreeable colour, and are destitute of the touch. In other annual weeds, the groundsel are to be hoed down or pulled as they appear, when the ground is in crop.

GROUP, the combining of several bodies so as to form an agreeable whole. In drawing, one or more groups compose the picture. A bunch of grapes, a cone, or a pyramid have been taken by different artists as the model form of a group.

GROUSE (Tetrao), a genus of gallinaceous birds, which, as defined by Linnæus, included partridges, quails, and all the birds now forming the family Tetraonide, and divided into many genera. The Tetraonide have a very short bill, rather thick, sharp, and a little curved, and very generally a naked red patch over or behind the eye. They have three toes before, and generally one hind toe, placed high on the tarsus, but the hind toe is often very short, and sometimes wanting. Those to which the name G. is popularly given have the legs feathered to the feet, but in the genus Tetrao, as now restricted by ornithologists, the toes are not feathered; in moorowl and ptarmigan, they are completely naked. Their heads have therefore become separated into a distinct genus, Lagopus. Partridges, quails, &c., which have not the tarsi feathered, are regarded as connecting the families Tetraonide and Phasianide, and are sometimes referred to the latter, although they have a distinct family character, and the gener is generally recognised. Some of the Tetraonide are polygamous, and this is the case with all, or almost all, the species of the genus Tetrao, whilst those of Lagopus, so nearly allied to them, pair.—

The genus Tetrao contains the largest birds of the family, exceeded in this respect by almost no other gallinaceous birds. They have a full figure, with much muscular power, the tail is longer than in most of the family, is composed of broad feathers, and generally rounded. The females differ very considerably in plumage from the males, which are often resplendent in black, brown, green, and blue. The species are natives of the northern and temperate parts of Europe, Asia, and those regions in which the Tetraonide in general are most abundant, although some of the family are found in warmer and more southern countries.—The largest species of Tetrao is the Caspia (q.v.), Wood (q.v., or Cook of the Woods (T. urquhaini)); and next to it, among European species, ranks the Blackcock (q.v.), (T. tetra), the only other European species indeed, if the somewhat rare T. hybrida of continental Europe, the Rustlehau of the S-elas

Ground Squirrel.

‘chipping clucking sound, very widely differing from the quacking, chattering cry of the squirrels.’ A well-known species is the WACKER (Chipping Squirrel) (T. Lysteri) of North America, of a brownish-grey colour, striped with black and yellowish white, the belly white. It is much persecuted by boys, with whom the hunting of it is a favourite sport. The fur is used for muffs, tippets, &c. Other species of G. S. are found in America, Asia, and Africa.

GROUNDLING (Rotia tenia), a small fish of the family Cycrinide, found in some of the rivers of England. It is never more than three or four inches long. It receives its name from habitually keeping close to the bottom. It is probably often, the other for the Loach (q.v.), which it much resembles; but, besides its smaller size, it is of a much more compressed form, and is particularly distinguished by a forked spine beneath each eye. These have been

118
GROVES—GRUGRU.

(see Blackcock), regarded as the result of a mere accidental mixture of these two.—The Pinnated G., or Prairie Hen (T. cupido) of North America, is rather smaller than the blackcock; the general colour of the plumage is yellowish-red, with bars and crossings of black; the tail is very short and much rounded. The male has neck tufts of narrow feathers, the largest of which are five inches long, and is still more remarkably adorned with two long tail-plumes on either side, numbering along the sides of the neck for two-thirds of its length, and capable of inflation with air, and when inflated, resembling in bulk, colour, and surface, middle-sized oranges. The female of G. chiefly inhabits dry open districts. Many art whot on sa occasions. The food was at one time common in New Jersey and Pennsylvania, as well as in the western prairies, but has always become rare as a district has become cultivated and populous, notwithstanding laws in some cases enacted for its preservation. It has almost disappeared from the state of Kentucky, where it was at one time so extremely abundant, that children were constantly employed to prevent its depredations in the cultivated fields, and multitudes were shot and trapped merely to be sold away. In the north-eastern parts of the United States it exists, but is not abundant. It congregates in flocks in winter, which break up into smaller parties in spring. The males have many combats at the approach of the breeding season. It is described as a low tooting or booming. They strut, after the manner of turkey-cocks, with wings let down to the ground, and neck-feathers erected. Certain species are found in the wheatfields of America as their scratching-places, seem to be specially appropriated for their displays and combats, and there considerable numbers often meet about drybreak, dispersing again after the sun is up. The Plumage of the Pinnated G. consists of seeds, berries, the buds of trees and bushes, insects, &c. It is highly prized for the table in those parts of America where it is rare. The flesh resembles that of the blackcock.—The Spotted G., or Canadian G. (T. Canadensis), is smaller than the Pinnated G., about equal to the Scottish moorfowl. It inhabits the northern parts of America, and is plentiful near Hudson's Bay. It is chiefly found in forests of pine or fir, feeding mostly on worms, grubs, caterpillars, and seeds of these trees, as well as on their seeds, whence it is often called the Spruce Partridge. From this food the flesh acquires a strong and peculiar flavour in winter. The plumage of the upper parts is mostly brownish-black, transversely barred with brownish-grey; in some parts varying to a rusty orange. The tail is rounded.—The Dusky G. (T. obscurus) is a species almost as large as the capercaillie, a native of the shaly forests of the Rocky Mountains and the banks of the Columbia. The general colour is blackish-brown, the wings lighter. The tail is large and rounded.—The Moorhen (G. v.), or Red G. of Britain, is allied to the ptarmigan rather than to these species, and is called Red Phalarope by some systematic writers, although it is the species to which, in popular language, the name G. is almost exclusively appropriated in Britain. Other species, often popularly called G., are noticed in the articles Basia, Cock of the Plains, Gangha, Sirarbhatts, &c.

GROVES have, among almost all nations, been associated with religious rites, being chosen as suitable places for them, or even planted in order to this use. The pleasantness of groves may have had something to do with this, but probably far less than the sentiments of awe and solemnity naturally excited by the gloom of deep forests. Groves became so intimately associated with the idea of sacrifice and other religious rites, that the plantin, of a grove became itself an act of religion, like the erection of an altar or the building of a temple. Thus, 'Abraham planted a grove in Beersheba, and called there on the name of the Lord, the everlasting God' (Gen. xxi. 33). Afterwards, however, the Jews were forbidden to plant groves near the altar of the Lord (Deut. xvi. 21, 22), because of their association with idolatry, and with the cruel and abominable rites of the nations of Canaan, and of the neighbours of the Jews.

GROWING CORN on a farm, or on land let to a tenant, may be distrained in England by the landlord for rent which is already due and in arrear; that is, the landlord may seize and sell the corn to pay his rent. In Scotland, growing corn may also be sequestrated by the landlord (which means the same thing); but this can be done only for the rent which is current, and which will become due for the same year to which the crop belongs. In England, the landlord can distrain for several years' rent at one time.

GROWLER (Grytes salmoides), a fish of the Perch family, abundant in many of the rivers of North America, as the Connecticut, the Merrimac, the Charles, and the Hudson. It attains a length of two feet. It is of an olive colour, dark on the upper parts, and becoming greyish-white beneath. The G. is much esteemed for the table. It affords good sport to anglers. It receives its name from a sound which it emits. The genus Gryates has small scales and only fine carilike teeth. Another species is found in the Macquarie River, in New Holland.

GRUB, the name commonly given to the larvae of coleopterous insects. See COLEOPTERIA. Some grubs are too well known to farmers and gardeners for the injury they do to the roots of plants, and thus we hear of crops suffering from the grub, but different species are destructive to different kinds of plants. The most important are noticed under their proper names, and reference is made to the more important cultivated plants to those grubs most hurtful to them.

GRUBBER, an agricultural implement which has recently come into very general use, and of which there are many forms or varieties, all, however, essentially the same in their principle as well as in their uses. Some of the forms are called by their inventors Cultivators and Scyrrides. The grubber consists of a framework of cast or wrought iron, in which a long, thin, flat or oval blade, like those of a harrow, but curved, and so placed as to enter the ground somewhat obliquely when the implement moves forward; the whole moving on wheels, by which the depth to which the teeth may penetrate is regulated; it is provided with various mechanical adaptations, enabling the workman somewhat to vary the depth, or to lift the teeth out of the ground partially or altogether, when it may be necessary to clear them of obstructive clods or accumulations of weeds, to turn at the head of a ridge, or to travel to or from the field. The grubber is sometimes used for tearing up cloverfields and stubbles before the plough is used, but more generally in land already ploughed, to stir it afresh, to clear it of weeds, to bring clods to the surface, that they may be broken, &c. A grubber with five teeth gives work for two strong horses.

GRUGRU, the crab or larva of Calandra palmarum (also called Rhynchosorpus palmarum, and Cordylus palmarum), an insect of the weevil family (Rhynchosorpus), inhabiting Guiana and other tropical parts of America. The perfect insect is an inch and a half long. The grub is an ugly inactive-
Guadalajara

Guadalupe—Guadalajara.

creature of a whitish cream colour, as long and as thick as a man's thumb, and lives in the soft and spongy central part of the Cabbage Palm (Euterpe oleracea), on which it feeds. It is extremely fat and oily, and is esteemed a great delicacy, not only by the Indians, but by many of the European colonists and their descendants, particularly the Dutch. It is cooked by roasting, and eaten with bread and butter, after being sprinkled with cayenne pepper. The juice of this fruit is said to be most tempting to epicures. A cabbage palm which has been cut down often becomes in a short time almost filled with grusgrus; but they are usually obtained from the upper part of the stem of growing palms near the crown. A negro is often sent up with a cutlass, to cut them out of the wood.

GRÜNBERG, a town of Prussia, in the province of Silesia, is situated near the northern boundary of the province, on the Golden Lunee, 59 miles north-north-west of the town of Liegnitz. It consists of the town proper, surrounded by a wall, pierced by three gates, and of four important suburbs, and is seated amid vine-clad mountains. G is chiefly known for the wine which is produced in the vicinity. The 700th year of its trade in this commodity was celebrated here in October 1858. In 1858, 50,000 eimers (755,500 gallons) of wine were produced. G. has also an active trade in the manufacture of woollen cloths and tobacco, and in silk-spinning and dyeing. Pop. 10,751.

GRUS AND GRUIDE. See CRANK.

GRUYÈRES, a small decayed town of Switzerland, in the canton of Freiburg, 16 miles south-south-west of the town of that name, is situated about a mile from the left bank of the Saane or Sarine. The town is known chiefly from its giving name to the famous Gruyère cheese, which is made in great quantities in the surrounding district. Pop. about 400.

GRIULUS, a Linean genus of insects of the order Orthoptera, answering to the section Stsaltaria (Lat. leapers) of later entomologists, and containing crickets, grasshoppers, locusts, &c. The genus has been subdivided into many genera, which have been grouped into families; but great confusion exists in the nomenclature, the crickets and their allies being the genus Gryllus, and family Gryllidae of some authors, Acheta and Acheirole of others; grasshoppers being the genus Locusta, Grallidó of some, Locusta and Gryllidó of some, Gryllidó of others; and locusts, in like manner, being Locusta and Locustóide, or Acryllium and Acyri- dide. See CRICKET, GRASSHOPPER, and LOCUST.

The three groups are very closely allied. They are all characterised by the large thighs of the last pair of legs, and great power of leaping. The stridulous sounds which they emit are produced in some—crickets and grasshoppers—by rubbing together the bases of the elytra; in others—locusts—by rubbing the thighs against the elytra. The females generally lay their eggs in the ground.

GRYB-BOO (Antelope melanois or Calustragon melnanus), an animal of the antelope family, a native of South Africa, and common in most parts of Cape Colony. It is about three feet in length, and about a foot and a half in height at the shoulder. The gryb-boo lives in pairs on the plains. It is not very swift, is easily captured, and its flesh is much esteemed.

GUACHARO (Slatornia Caripensis), a remarkable South American bird, of the smaller Ineessures, and tribe Frugivores, generally referred to the family Cyprianulide, but widely differing from the goatsnackers and most of that family, and indeed from the Ineessures generally, in having a strong bill, and being frugivorous. The food of the G. consists of hard and dry fruits. It is about the size of a common fowl; the plumage brownish gray, with small black streaks and dots. The G. is a nocturnal bird, a circumstance very singular among frugivorous birds. It spends the day in deep and dark caverns, where great numbers congregate and make their nests. Humboldt gives a most interesting account, in his Personal Narrative, of a visit to the great Guacharo cavern in the valley of Caripe, near Cumana. This cavern is visited once a year for the sake of the fowl; the young birds, which are slaughtered in great numbers, and their fat melted and stored for use as butter or oil. The clarified fat is half liquid, transparent, inodorous, and will keep for a year without becoming rancid.

GUACHINA'NGO, a small town of Mexico, in the north of the state of Puebla, and 103 miles north-east of the city of Mexico, has a population of 6,000, and is noted for the great quantity of excellent vanilla raised in the vicinity.

GUACHOS, the name given to the country-people who inhabit the Pampas in the states of La Plata, and are engaged in rearing cattle. Although they pride themselves on being whites, they belong chiefly to the Mestizo class, and by their intercourse with Indian women, contribute to approximate the population of the inland provinces to the type of the aboriginal inhabitants, whom they likewise greatly resemble both in their manners and turn of mind.

GUADALAJA'RA, or GUADALAXARA, one of the handsomest towns in Mexico, is the capital of the state of Jalisco, in the Mexican Confederation. It stands on the Rio Grande de Santiago, which, after passing through Lake Chapala, enters the Pacific at San Bias. The population has been estimated at 50,000. As the houses are mostly of one story, the place covers a wide extent of surface. It contains the buildings for the government, a cathedral, a mint, an episcopal palace, an opera, large barracks, a college, and many inferior seminaries. It has well-supplied markets, and extensive manufacture of cotton and earthen-ware.
the churches of San Francesco and San Esteban. G. is the chief town of the fine pastoral and wheat district of the Alcarria. Pop. 6533.

GUADALAJARA, a province of Spain, the most northeasterly of the five modern provinces into which New Castile has been divided. See Castile.

GUADALAVIAR, or TURIA, a river of Spain, has its source near that of the Tagus, in the southwest of Aragon, and after a course of 130 miles, in a generally south-south-east direction, falls into the Mediterranean, at Grao, a mile and a half east of Valencia. The G., in passing through the beautiful gardens of Valencia, is divided, for purposes of irrigation, into eight channels. Its mouth is much silted up.

GUADALQUIVIR (Arab. Wad-al-Kubr, the great river; anc. Batis), the most important river of Spain, for the mass of waters which it conveys to the ocean, and for the extent of its natural navigation; has its origin in the Sierra de Cazorla, near the eastern border of the province of Jaen; flows in a general south-west direction through the provinces of Jaen, Cordova, and Seville, and forms the boundary for about ten miles between the provinces of Huelva and Cadiz, falls into the Atlantic at San Lucar de Barrameda, after a course of about 260 miles. The principal towns upon its banks are Montoro, Cordova, and Seville, to the last of which, about 80 miles above its mouth, the river is navigable. Below Seville it twice divides itself into two branches, forming two islands—the Isla Menor and the Isla Mayor. Its chief affluents are the Guadajos and the Jerte on the left, and the Guadalimar and the Guadiato on the right. The lower course of the G. is sluggish and dreary in the highest degree; the stream itself is turbid and muddy, and eats its way through an alluvial level given up to herds of cattle and to aquatic fowls. There are no villages in this district, which, though favourable to animal and vegetable life, is fatal to man, from the ague and fever caused by the numerous swamps. There is no great trade on the G.; foreign vessels are generally manned at the Isla Menor, and their cargoes sent up to Seville by means of barges.

GUADALUPE, a river of North America, rises in the southern section of the state of Texas, and flows in a south-eastern direction, emptying its waters into Espiritu Santo Bay; after a course estimated at about 475 miles. The general direction of the stream and its capabilities are not yet well known.

GUADALUPE-Y-CALVO, a town of Mexico, in the state of Chihuahua, and 170 miles south-southwest of the town of that name, is situated in a mountainous district, in close vicinity to several important silver mines. Pop. 10,000.

GUADELOULE, one of the Lesser Antilles in the West Indies, and the most important of those which belong to France, lies in lat. 16° N. and long 61° 45' W., and contains 534 square miles, and about 153,000 inhabitants, of whom three-fourths are of a mixed color and inhosannity. In the east, and Basse Terre or Guadeloupe Proper on the west by a strait of about 40 yards in width, which, under the name of Salt River, is navigable for vessels of fifty tons. The nomenclature of the separate islands is apparently out of place, for the two, Basse Terre is the loftier, and Grande Terre is the smaller. Grande Terre, generally low, is of coral formation; Basse Terre, on the contrary, is traversed by volcanic mountains, which culminate in La Soufriere (the Sulphur Mine') to the height of 918 feet. Though this range shows no regular crater, yet it emits, by several orifices, columns of smoke, and even sparks of fire. In addition to these symptoms of subterranean action, may be mentioned a boiling spring and frequent earthquakes. Basse Terre, on the island of its own name, is the chief town, having an indigenous population. G., as dependencies, are the neighbouring islets of Desirade, Marie Galante, Les Saintes, and the north part of St. Martin. In 1856, the exports and the imports respectively amounted to 2857, 500 and to 4204, 186. In 1848, slave trade was abolished by a decree of the French republic. The island was discovered by Columbus in 1493; but it was not before 1635 that it was colonised by the French; and after repeatedly falling into the hands of England, during her wars with France, it was at length permanently ceded to the latter power in 1816.

GUADIANA (anc. Anaes), one of the longest but at the same time the narrowest and poorest in volume of the five great Spanish rivers, rises on the western boundary of Murcia, about 8 miles north-west of the town of Alcaraz. From its source it flows north-west for about 30 miles, after which it disappears among swamps; flows underground in a westward direction for nearly 30 miles; and rises again at Daymiel, after throwing up in its subterraneous course numerous lakes called Los ojos (the eyes) de la Guadiana. From Daymiel it pursues a westward course through La Mancha and the province of Estremadura, until, passing the town of Badajoz, it bends southward, and flows in that direction, forming, for about 35 miles, the boundary between Spain and Portugal. Near the town of Mousaras it enters the Portuguese territory, and flows through the eastern district of the province of Alentejo. Finally, turning eastward, and again forming the international boundary for about 35 miles, it enters the Atlantic below the town of Aymantina. It is about 429 miles in length, and is navigable only for about 35 miles. Its chief affluents are the Iguguela on the right, and the Javalon and Ardila on the left.

GUADUAS, a city of New Granada, is situated in that portion of the republic which belongs to South America. It stands near the east or right bank of the Magdalena, which is the largest river of the country, and is one of the most elevated towns on the globe, being 8700 feet above the level of the sea. It contains about 4000 inhabitants.

GUAICAM, a genus of trees of the natural order Zygophyllaceae, natives of the tropical parts of America, having abruptly pinnate leaves, and axillary flowers on one-flowered stalks, often in small clusters. The flowers have a 5-partite calyx, five petals, ten stamens, and a tapering style; the fruit is a capsule, 5-angled and 5-seeded, or the cells by abortion fewer, one seed in each cell. The trees of this genus are remarkable for the hardness and heaviness of their wood, generally known as Lignum Vitis, but sometimes as Guaiacum Wood, and sometimes as Brazil Wood; as well as for their peculiar resinous products collected from the resinous glandular growth of G., and called Gum Guaiacum. The species to which the commercial Lignum Vitis and Guaiacum are commonly referred, is G. officinale, a native of some of the West India islands, and of the 14 or continental parts of America. This tree sometimes 30 or 40 feet high, with two or three pairs of ovate, obtuse, and perfectly smooth leaflets, pale blue flowers, a furrowed bark, and generally a crooked stem and knotty branches. Dries rapidly; very hard; being inferior to other species, as well as this, supply part of the G. wood and resin of commerce. At present, they are obtained chiefly from Cuba, Jamaica, and St.
GUAN—GUANAPARO.

Dominoes. The wood is imported in billets about three feet long and one foot in diameter, of a greenish-brown colour. This is the colour of the heartwood, the sap-wood is pale yellow. G. wood is remarkable for the direction of its fibres, each layer of which crosses the preceding diagonally; annual rings are scarcely to be observed, and the pith is extremely small. It sinks in water. It is much valued, and used for many purposes, chiefly by turners; ships' blocks, rulers, pestles, and bowls (see BOWIE) are among the articles most commonly made of it. When rubbed or heated, it emits a faint disagreeable aromatic smell; its taste is also pungent and aromatic. Shavings and rasings of the wood are bought by apothecaries for medicinal use. The bark is also used in medicine on the continent of Europe, although not in Britain. The virtues of both wood and bark depend chiefly on the resin which they contain, and which is itself used in powder, pill, and tincture. It is an acrid stimulant, and has been employed with advantage in chronic rheumatism, in chronic skin diseases, in certain cases of scanty and painful menstruation (and hence it is occasionally an effectual remedy in cases of sterility), and in chronic catarrh. It has also been highly praised as a preventive of gout. The resin is an ingredient of the well-known Plummer's Pills. In the 16th and 17th centuries, G. was the remedy most in repute for syphilis. The resin sometimes flows spontaneously from the stem of the G-tree; it is sometimes obtained artificially. It is of a greenish-brown colour, and has a brilliant resinous fracture. It has scarcely any taste, but leaves a burning sensation in the mouth. One of its most striking characteristics is that it is coloured blue by its oxidising agents. It contains guaiacic acid (\(\text{H}_2\text{C}_6\text{H}_4\text{O}_3\)), which closely resembles benzoic acid, and yields, on distillation, certain definite compounds known as guaiacol, pyrogallol, and hydride of guaiacyl.

GUAN, or YACOU (Penelope), a genus of large gallinaceous birds of the family Cracidae. They have a naked skin on the throat capable of being inflated or swollen, and a naked space around each eye. The name G. more particularly belongs to Penelope cristata, a species of which the entire length is about thirty inches. It is a native of the forests of Brazil and Guiana, and has been long domesticated in South America. It has been found to endure the climate of Britain and of Holland so well, that hopes are entertained of its becoming common in the poultry-yards of Europe. Its flesh is much esteemed.

GUANABACOA. See HAVANA.

GUANAHANI, or CAT ISLAND, one of the Bahamas, is generally regarded as Columbus's first discovery in the New World, being presumed to be identical with the San Salvador of the illustrious navigator. Recent criticism, however, appears to have transferred the honour to Watling Island (q. v.), which is about 50 miles to the east-south-east.

GUANAJUATO, or GUANAXUATO, an inland state of Mexico, in lat. between 26° and 22° N., and long. between 99° 40' and 102° 40' W., is bounded on the N. by the states of San Luis Potosi, on the E. by Querétaro, on the S. by Michoacán, and on the W. by Xalisco. It has an area of 12,619 square miles, and a population in 1857 of 729,103. The surface, a portion of the lofty plateau of Anahuac, has an elevation of 6000 feet above sea-level, and is traversed by chains of mountains, among which those of Santa Rosa are porphyritic, and present elevations of 11,400 feet in height. The state is watered by no river of consequence. The soil is fertile; the crops, wheat, potatoes, and frijoles (beans) are the chief grain crops raised; the vine, the chilli ( Capsicum), or red pepper, and the olive, are also largely cultivated. Among the valuable mineral products of the state are silver, iron, lead, and copper, the first in the greatest abundance. The manufactures are woolens, cottons, leather, earthen-ware, and refined sugar. The climate is mild and pure. The population of the state divides itself into three races—25 per cent. of the whole being whites, 39 per cent. Indian, and 36 per cent. mixed.

GUANAJUATO, or SANTA FE DE GUANAJUATO, a city of Mexico, capital of the state of the same name, is irregularly built on an extremely uneven district of hill and valley, in lat. 21° N., and long. 106° 50' W. The streets are steep and tortuous, but the houses are generally well built, and have gaily painted outsides, green being the favourite colour. It contains many fine public buildings, the chief of which are the cathedral, the monasteries (eight in number), the college, the gymnasium, the theatre, and the mint. G. stands in a district in which, within a circuit of five leagues, there are upwards of 100 mines. Pop. (1854) 63,000.

GUANAPARO, a river of Yemania, in South America, rises in the department of Caracari, and, after an easterly course of 230 miles, joins the Portuguesa, which again, through the Apure, sends its tribute to the Orinoco.
GUANARÉ—GUANO.

GUANARÉ, a river of Venezuela, in South America, is an affluent of the Portuguesa. See GUANARO. On its banks are two towns, both of which derive their names from it: Guanaro, an inconsiderable place; and Guanare, a city of 12,000 inhabitants.

GUANCABELICA. See HUANCABELICA.

GUANINE is a yellowish-white, amorphous substance, which derives its name from its being a constituent of guano; it, however, also forms the chief constituent of the excrement of spiders, has been found attached to the scales of fishes, thebek, for example—and seems to be a normal constituent of the mammalian liver and pancreas.

6. belongs to that class of bodies which were formerly called bases, but which, from their combining equally with acids, bases, or salts, are now often termed amides or amide-like compounds.

By oxidation with permanganate of potash, it is converted into urea, oxalic acid, and oxyguanine, a substance of a more highly oxidised form than it is.

With regard to its occurrence in guano, as it has not been found in the recent excrement of seabirds, there is every reason to believe that it is formed by slow oxidation (from atmospheric action) of the uric acid, much as uric acid can be made to yield urea and oxalic acid, and in the pancreas and liver it probably represents one of those transient stages of disintegrated nitrogenous tissue which are finally excreted by the kidneys in the more highly oxidised form of urea.

GUANO (derived from the Peruvian word ahuano, dung) is the excrementitious deposit of certain seabirds, which occurs in immense quantities on certain coasts and islands where the climate is dry and free from rain. Although the use of guano as a manure is comparatively recent in this country and in Europe, its value in agriculture was well known to the Peruvians long before they were visited by the Spaniards. We learn from the Memorias de los Reales de Caracas, de la Vega, published in 1631, that in the times of the Incas no one was allowed, under pain of death, to visit the guano islands during the breeding season, or, under any circumstances, to kill the birds which yield this substance; and that overseers were appointed by the government to take charge of the guano districts, and to assign to each claimant his due share of the produce of the article. Alexander von Humboldt first brought specimens of guano to Europe in 1804, and sent them to Fourier, Quinquini, and Klaproth, the best analytical chemists of the day.

Mr Nesbit, in a useful little pamphlet entitled The History and Properties of the Different Varieties of Natural Guano, remarks that the quality and value of these manures, commercially, depend almost wholly upon the amount of decomposition to which they have been subjected by the action of the atmosphere. The fossil matter of the fish-eating birds, which, by its long accumulation, forms the guano deposits, consists essentially of nitrogenous and phosphatic compounds, the former being chiefly ammonia salts derived from the decomposition of the uric acid and urates which exist in the fresh excrements of these birds. The ammoniacal portion of these deposits, and some of the phosphates, are tolerably soluble in water, and are readily washed away by rain. The late Professor Johnston remarked, that 'a single day of English rain would dissolve out and carry away into the sea a considerable portion of one of the largest accumulations, and that a single year of English weather would cause many of them entirely to disappear.' In dry climates, where very little rainfall occurs, as in some parts of Bolivia and Peru, on the western coast of South America, the dung deposited suffers very little from the action of the atmosphere, and retains nearly the whole of its soluble nitrogenous and phosphatic compounds. Guano in some regions where rain falls freely, lose a great part of their soluble constituents, but remain rich in their less soluble constituents—the phosphates of lime and magnesia. Mr Nesbit divides guano according to their composition, into three classes: 1. Those which have suffered little by atmospheric action, and which retain nearly the whole of their original constituents, such as the Angamos and Peruvian guanos. 2. Those which have lost a considerable portion of their soluble constituents, such as the Ichaboe, Bolivian, and Chilian guanos. 3. Those which have lost nearly all their ammonia, and contain but little more than the earthy phosphates of the animal deposit. Many of these are largely contaminated with sand; and, in the third class, we place the various African guanos (excepting that from Ichaboe, West Indian guano, Kooria Mooria (islands off the coast of Arabia) guano, Sombrero guano, Patagonian guano, Shark's Bay guano (from Australia), &c.

Most of the so-called Peruvian guano is obtained from the Chinchas Islands, which are three in number, and are situated about 12 miles off the coast of Peru, between 13 and 14 degrees north, a few miles from these islands is from 5 to 8 miles in circumference, and consists of granite covered with guano, in some places to a height of 200 feet, in successive horizontal strata, varying in thickness from three inches to a foot, and in colour from a light to a dark brown. Sometimes, however, we come on a vertical surface of upwards of 100 feet of a perfectly uniform appearance. If Humboldt's statement is correct, that 'during 300 years the coast-birds have deposited guano only a few lines in thickness,' the extreme age of the lower strata becomes at once obvious.

The following table represents the mean of 78 samples of Peruvian guanos, analysed by Mr Way:

GUANO.

The nitrogen in these analyses is calculated as ammonia for the purpose of comparison. In reality, it exists in various forms of combination—viz., as uric acid, urea occasionally, urate, oxalate, hydrochlorate, phosphate, &c., of ammonia, other urates, guanine (q. v.), and undefined nitrogenous compounds. Hence, as may be inferred, a complete analysis of guano is a work of very considerable labour; but as its agricultural value depends mainly on the amount of ammonia, nitrate, and insoluble phosphates, and alkaline salts, which it contains, such analyses as those we have given are sufficient for practical purposes, and they are easily made.

As good Peruvian guano sells at about £13 per ton, there is a strong inducement to adulterate it.umber, powdered stones, various earths, partially decomposed saw-dust, and other substances, are used for this purpose, and specimens have been sold containing mere traces of the genuine article. Hence it is expedient that large purchasers should either send a sample to a good chemist for analysis, or should cork up and retain a small quantity in a bottle for analyses, provided the crops to which he has applied his guano do not answer reasonable expectation. A chemist is attached to most agricultural societies and clubs, who performs such analyses for a moderate fee. The numerous analyses of Professor Anderson, the chemist to the Highland Society, and of other chemists, afford a very valuable test in checking the sale of adulterated guano in Scotland. The farmer can, however, readily apply the following simple tests, which are sufficient not only for the detection of any considerable amount of adulteration, but will also serve to distinguish the naturally good from the naturally inferior guanos.

1. Test by Drying.—If the guano, as is generally the case with the Peruvian and Chili varieties, is a uniform powder, weigh out two ounces, spread it on a flat plate, and dry it in a dry and moderately warm room. What it may then have lost in weight must be esteemed superfluous water. Many sorts of guano are so moist as to lose 20 or 25 per cent. of their weight by this gentle drying. If a very small quantity be applied without loss in a dry and uniformly warm room, then a mere weighing may be sufficient to detect any difference in weight, and it may be ascertained whether the guano is genuine or not. If, on the contrary, after gentle drying, it is found that there has been a loss of less than 10 per cent., it is likely to be genuine; but if it has lost more than 10 per cent., it is adulterated.

2. Test by Combustion.—Pour half an ounce of the guano into an iron ladle, such as is used for casting bullets, and place it upon red-hot coals, until nothing but a white or grayish ash is left, which must be well washed with water. The best sorts of Peruvian guano do not yield more than 30 or 33 per cent. of ash, while inferior varieties, such as Patagonian, Chili, and African guano, leave a residue of 60, or even 80 per cent.; and those which are intentionally adulterated, may leave a still larger residue. Genuine guano of all kinds yields a white or gray ash; and a yellow or redish ash indicates the adulteration with earthy matter, sand, &c.

This test is based upon the fact that the most important ingredients, viz., the nitrogenous compounds, become volatilised, and escape, when subjected to a sufficient amount of heat. The difference of colour of the vapours evolved in the process, according to the degree of the first or third rate guano, must also be noticed. The vapours from the better kinds have a pungent smell like spirits of hartshorn, with a peculiar piquancy somewhat resembling that of rich old decayed cheese; while the air rising from inferior varieties smell like angel-horn-shavings or hair.

3. The Lime test affords a ready means of roughly determining the relative quantities of ammonia in different specimens of guano. Put a teaspoonful of each kind of guano, and an equal quantity of slaked lime, into a wine-glass; then add two or three teaspoonfuls of water, and mix the substances together with a glass rod. Lime being a stronger base than ammonia, liberates the latter from the ammonia salts contained in the guano; and the better the guano is, the stronger will be the pungent ammoniacal odour which escapes from the mixture. The slaked lime should be preserved in a dry and well-corked bottle, so as to exclude the air.

4. The Hot-water test affords a simple means of determining the goodness of guano. We may either boil half an ounce of dried guano in five or six ounces of water, and filter the solution while hot, or we may place one guano on a spirit-lamp, and continue to pour boiling water over it, until the drops that come through the filter cease to yield any residue when heated to dryness on a glass slip held over the spirit-lamp. As a general rule, the larger the quantity of guano that is dissolved in hot water, the more ammonia salts does it contain, and the better it is. In the best or Peruvian guano, the insoluble residue ranges from 50 to 50 per cent., while in the inferior varieties it may amount to 80 or 90 per cent.

5. The Acid test serves to detect the chalk which occurs in the Kooria Mooria guano, and is used as an adulteration for other varieties. Mix the powdered guano with a little water, and add a little hydrochloric acid or strong vinegar. If chalk is present, effervescence from the liberation of carbonic acid occurs.

6. The Weight affords the easiest test for the purity of guano. According to Professor Anderson, a bushel of pure Peruvian guano should not weigh more than from 56 to 60 lbs.; but according to most authorities it should weigh almost exactly 70 lbs. If heavier than 73 lbs., it is adulterated with clay, marl, &c., or the guano is impure, and should be rejected.

There has been much discussion regarding the relative values of the fertilising ingredients of guano. Professor Anderson, at a meeting of the Highland Society, gave the following figures as indicating, according to the authority named, the value, per ton, of the most important ingredients in guano:

<table>
<thead>
<tr>
<th>Ingredient</th>
<th>Value, £ per ton</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ammonia</td>
<td>7.00</td>
</tr>
<tr>
<td>Phosphates</td>
<td>8.00</td>
</tr>
<tr>
<td>Potash</td>
<td>6.00</td>
</tr>
<tr>
<td>Organic matters</td>
<td>1.00</td>
</tr>
</tbody>
</table>

From these tables we can calculate the money-value of any guano that has been analysed in reference to the above constituents. We give the following example (using Nesbit's numbers) of the money-value of 100 tons of Peruvian guano:

<table>
<thead>
<tr>
<th>Ingredient</th>
<th>Value per Ton</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moisture</td>
<td>15.10</td>
</tr>
<tr>
<td>Ammonia</td>
<td>16.60</td>
</tr>
<tr>
<td>Other organic matter</td>
<td>3.75</td>
</tr>
<tr>
<td>Insoluble phosphates of lime</td>
<td>10.13</td>
</tr>
<tr>
<td>Potash</td>
<td>1.76</td>
</tr>
<tr>
<td>Organic matters</td>
<td>1.60</td>
</tr>
<tr>
<td>Alkaline salts</td>
<td>1.07</td>
</tr>
<tr>
<td>Nitrate</td>
<td>3.99</td>
</tr>
</tbody>
</table>

Hence, as 100 tons of this guano contain ingredients worth £1345, the value of one ton is £13.45.
GUANTA—GUARANTY.

If the value of a manure be calculated, as is done by Boussingault and other chemists, according to the amount of nitrogen which it contains, one ton of good Peruvian guano is equal to 33½ tons of farmyard manure, 20 tons of horse-dung, 384 tons of cow-dung, 224 tons of pig-dung, or 14½ tons of human excrement.

When we consider what guano is, viz., that it is the most or less decayed excrement of fish-eating birds, it consists essentially of the ash constituents of the flesh of fish, together with ammonia salts—we need not wonder that its application to the land as a manure should so largely increase its productiveness. 'for guano,' says Liebig, 'contains not only the mineral elements which a soil must possess to produce corn, but also in the ammonia an indispensable element of food which serves to quicken their action, and to shorten the time required for their assimilation. On many fields, the ammonia in the guano may, if the weather prove propitious, possibly effect the assimilation of double the ordinary quantity of these mineral constituents, and thus render the amount of produce yielded in one year equal to what would have been otherwise obtained in two years by these mineral matters alone.'

The introduction of guano into this country as a manure is comparatively recent. In 1840, only 20 casks of it were imported. In 1841, the Earl of Derby—then Lord Stanley—spoke strongly in its recommendation at the Liverpool meeting of the Royal Agricultural Society of England; and from that time it has come rapidly into use, as may be seen from the following table of imports:

<table>

As we know the chemical composition of natural guano, an artificial guano may be readily compounded by the admixture, in due proportions, of its constituents. The following mixture, recommended by the late Professor Johnston, forms one of the best imitations of guano, 132 lbs. of its being equal in power to 1 cwt. of good Peruvian guano: Mix 78 lbs. of bone-dust, 25 lbs. of sulphate of ammonia, 11 lbs. of pearl-ash, 25 lbs. of common salt, and 2 lbs. of dry sulphate of soda. All these materials, excepting the bone-ash, may be procured from any druggist.

Guano is largely used for all the cultivated crops on the farm. Being a high-priced, but concentrated and powerful fertiliser, in ordinary farm-management it is applied with more economical results to some crops than to others. On grasses proper, it is sown broadcast in the early part of spring, when vegetation begins to start. At this time the roots take it up, and prevent it from being washed out of the soil. Clover, on the same principles, being a deep-rooted plant, is supposed by some to be best dressed with it in autumn, before vegetation is stopped for the season. The roots store up the active principles of the manure till spring; and the plants are in a far more powerful state at the summer growth. From two to three cwts. of guano per acre is the common allowance for grasses intended to be cut for hay, but the Italian variety of ryegrass will sometimes bear a large quantity, and is only to be bound by the results. Guano is rather too soluble to be applied to early autumn sow wheat. It both stimulates the plant too much before winter, and is apt to be partially washed out of the soil with the winter rains. In moist springs, when there are abundance of rains to wash it in, guano forms an admirable top-dressing for winter wheat. For spring sow wheat, and summer sow wheat, no manure has a more powerful influence. The closer that it is put to seed, the better. The common dressing is from two to three cwts. to the acre for cereals kept in winter that require this quantity. The most the stronger the land is, the larger the quantity that can be applied with a prospect of yielding a profit. The same principle should be observed in its use for the turnip crop. As much as from four to six cwts. may sometimes be beneficially applied to early sown turnips on deep and able soils, while two to three cwts., when farmyard manure is given, will in general prove the most economical quantity. Guano is not to produce too much heat when it is applied in large quantities to late sown turnips, and to prevent the formation of bulbs. In such circumstances, phosphoric manures will often yield better crops at less expense. When guano is applied to beans or potatoes, they should be also dressed with farmyard manure. Guano does not possess the power of sustaining the healthy growth of these plants on most soils without something else in addition.

GUANTA. See Huanta.

GUAPI, a river of South America, rises in Bolivia, and joins the Mamore on its way to the Amazon, after a winding course of 550 miles.

GUAPORÉ, a river of South America, rises in Brazil, and, after a course of 400 miles, unites with the Mamore to form the Madeira, an affluent of the Amazon.

GUARANA BREAD is a kind of food prepared by the savages of Brazil from the seeds of a plant supposed to belong to the genus Paulinia (natural order Sapindaceae), and which has been called P. sordida. It is in round or oblong cakes, which are regarded in all parts of Brazil as very efficacious in the cure of many disorders, and which contain, besides other substances, some of them nutritious, a considerable quantity of a substance supposed to be identical with theine or caffeine. The Brazilians pound the Guarana Bread in water, sweeten it, and use it as a stomachic and febrifuge. It is also reputed aphrodisiac.—The genus Paulinia contains several species remarkable for their extremely poisonous properties.

GUARANTY, or GUARANTEE, is a contract by which one person binds himself to pay a debt or do some act in case of the failure of some other person, whose debt or duty it is to do the thing guaranteed. The person so binding himself is generally called the surety in England, while the person who is primarily liable is called the principal. Thus, where A borrows money, and B joins a party in a bill of exchange or a bond to secure the loan, B is a surety. Where B guarantees that certain goods which are supplied to A shall be paid for, he is more usually styled a guarantor rather than a surety, but the liability is the same.

Such a contract must be in writing, for the Statute of Frauds (29 Charles II. c. 3) required that no action should be brought whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person, unless the agreement or promise be in writing signed by the person so to be charged. Where a memorandum or note thereof should be by writing and signed by the party to be charged therewith, or some other person by him lawfully authorised. So that a surety can only be held liable by some writing signed by his agent. And Lord Tenterden's Act (9 Geo. IV. c. 14, s. 6) enacted the same thing as to persons
making representations as to the character, ability, or dealings of another, with intent that the latter may obtain credit. In order to bind the surety, there must also be no deceit or misrepresentation used as to the nature of the risk or as to the state of the accounts. If a guaranty is given to a firm, it is not binding after a change in the firm, unless the parties expressly stipulate to the contrary. If the creditor is the principal, or even give time, by way of indulgence to him, the surety is released, for he is thereby put to a disadvantage. In general, the creditor can sue either the principal or the surety for the debt at his option. If the surety is obliged to pay the debt of his principal, he can sue the principal for the money so paid, and is entitled to have all the securities assigned to him, so as to enable him to do so more effectually.

In Scotland, the law is substantially the same as regards principal and surety, or, as they are there called, principal and cautioner; but there are some minor differences, though many of the differences which formerly existed between the laws of the two countries were swept away by the statutes 19 and 20 Vict. c. 97, and 19 and 20 Vict. c. 60. The chief differences now are, that in Scotland it is not necessary to prove any consideration for the contract, though the contract is not by deed; that liability of the sureties is seven years, whereas in England it continues generally six years—and that the discharge of the surety can be proved only by the writ or oath of the creditor, whereas in England it can be proved by oral evidence. See Paterson's Comp. of E. and S. Laws.

GUARDAFUI, CAPE (anc. Aromatum Promontorius), the most eastern point of the African continent, and the extremity of an immense promontory stretching seaward in an east-north-east direction, and washed on the north-west by the Gulf of Aden and on the south-east by the Indian Ocean. The cape is in lat. 11° 50' N., long. 51° 20' E.

GUARDIA GRETLÉ, a small and unimportant town of Naples in the delegation of Abruzzo Citeriori, 12 miles south-south-east of Chieti. Pop. 6190.

GUARDIAN, in English Law, is the legal representative and custodian of infants, i.e., persons under the age of 21, and various species are distinguished. Guardian by nature is rather a popular than a legal term, especially when used in reference to a father or mother, who are often called guardians in general. In its technical sense, it is confined to an ancestor who is said to be guardian of his heir-apparent. Guardian for nurture is the name given to a father, or, after his death, to the mother, who, as such, has the custody and control of children until the age of 14. Guardian in socage is the term anciently given to the next of blood who had the legal custody of the person as well as estate of the heir to lands which descended in socage or freehold, until the heir attains the age of 14. A father may, by deed or will, appoint a guardian to his child. If he do not, the lord canceller will do so; but practically, this is only done when the child is entitled to property. When a guardian is appointed by the Court of Chancery, the infant is called a ward of court, and requires the sanction of the guardian for most purposes, and requires the permission of the Court of Chancery to marry, or rather, if the infant marries without such permission, those who assist him to such a contempt of court may be punished. A guardian ad litem is a person (usually the father, if alive) appointed by the Court of Chancery for the purpose of carrying on a suit in the name of an infant. In general, the power of a guardian extends to the person as well as the property of the infant; but in the case of guardians appointed by the Court of Chancery, their powers are under the strict control of that court.

The guardian of a Lunatic (q. v.) is usually called a committee. In Scotland, the word 'guardian' is sometimes used in reference to lunatics, but seldom applied, except in a popular sense, to those who have the custody and care of children. In corresponding cases in Scotland, the custody of a child under 12, if female, or 14, if male, belongs to her or his Tutor (q. v.) ; and from those ages to 21, the child has no legal guardian, being sui iuris, but the care of the child's property belongs to a Curator (q. v.).

Guardian of the poor, is in English parochial law an important functionary, being a person elected by a parish or union of parishes to manage the affairs of the poor. The ancient officers of the parish who attended to the affairs of the poor were called overseers; but by statutes, most of which are recent, it has been thought better to have a larger body of persons elected by the ratepayers of the parish to discharge most of these duties. Hence, many of the larger parishes are, either by a special statute or by order of the Poor-law Board, put under a board of guardians, and all poor-law unions are managed by guardians also. The ratepayers, in voting, have one vote for each £50 of rent they pay, but in no case are allowed more than six votes. The guardians have the management of the workhouse, and the maintenance, clothing, and relief of the poor, and in the regulations must comply with the orders of the Poor-law Board, a central authority, whose head is a member of parliament. Their duties are entirely regulated by these orders and by statutes. The officer of guardian is compulsory, but may be refused, if notice is given during the election.

In Scotland, the corresponding duties are discharged by the Parochial Board (q. v.), which is subject to the general Board of Supervision. See also Poor.

GUARDS are in all armies the élite of the troops, and usually those most heavily armed. In the British service, the Guards constitute, in time of peace, the garrison of London, and the guard of the sovereign at Windsor. The Guards compose what is called the Household Brigade, and include in cavalry the 1st and 2d Life Guards, and the

Royal Horse Guardsman (1742).
GUARDSHIP—GUATEMALA.

Equal Horse Guards (Blue); and in infantry, the Grenadier Guards, the Coldstream Guards, and the Scots Fusiliers Guards. These distinguished corps comprise 1314 cavalry in three regiments, and 437 infantry in seven battalions. In the officers of the regiments of Foot Guards hold higher army rank than that they bear regimentally—that is, engra rank with lieutenants of other regiments, lieutenants with lieutenants-colonels; and on exchanging into the line, they are thus enabled to exchange into the higher positions, a circumstance which often places officers of comparatively short service over veterans of the line, and causes, perhaps, more heartburning than any other anomaly among our regulations. As may be supposed, almost every officer in the Guards either purchases, or is ready to purchase, his commissions. The price, as fixed by regulation, greatly exceeds that in other regiments, and the fancy prices actually paid are often far in excess of regulation.

GUARDSHIP, the ship-of-war in charge of a port. She generally acts also as a depot for seamen raised there until appropriated to other vessels, and her captain is responsible for the safety and proper preservation of the men of the warship. It may be paid out of commission in the harbour. The superintendent of a dock-yard, if a flag-officer, carries his flag at the mast-head of the guardship; if he be only a captain, the guardship is usually under his nominal command, although the actual duties are carried on by the commander or next senior officer.

GUADE, a genus of tropical American trees of the natural order Meliaceae, of some of which the bark is used as an emetic and purgative. G. Guadua Dinoidea, originally named after the islands of the West Indies; the bark smelling so strongly of musk, that it may be used as a perfume.

GUARIN, Giovanni Battista, a popular and elegant poet, was born at Ferrara in 1557. At the termination of his studies in the universities of Padua, Padua, and Ferrara, he was appointed to the chair of literature in the latter, and soon after, the publication of some sonnets obtained for him great popularity as a poet. At the age of 30, he accepted service in the army, and was intrusted by Duke Alfonso II. with various diplomatic missions of delicacy and importance. Differences between him and the duke induced him to withdraw from the court of Ferrara about the year 1590. He resided for a time at Mantua, Florence, and Urbino, he returned to his native Ferrara, and discharged one final public mission, that of congratulating Pope Paul V. on his election to the tiara. He died in 1612 at Venice, whither he had been summoned to attend a lawsuit. An insatiable sensitivity, joined to an exaggerated estimate of his personal dignity, neutralized many qualities both brilliant and solid, which seemed to fit G. exactly for a poet's career. To these defects, in part, may be attributed the frequent mortifications which tracked him through life. As a poet, he is remarkable for refined grace of language and sweetness of sentiment, while his defects are occasional artificiality, a too constant recurrence of antithetical imagery, and an affected dullying with his ideas. His chief and most popular work, Il Pastor Fido (The Faithful Swain), is regarded in Italy as a standard of elegant pastoral composition, and obtained a highmeasure of popularity on its appearance. The writer designed it as a tragi-comic pastoral; its first dramatic representation was in honour of the nuptials of the Duke of Savoy and Catherine of Austria, 1585. It subsequently ran through forty editions during G.'s life, and was translated into almost all the modern languages. Tasso and G. have been frequently compared; the two poets were literary friends and reciprocal admirers, although rivals in love. G.'s most varied writings, including satires, sonnets, elegies, odes, and political treatises, were published at Ferrara in 1737, 4 vols. 4to.—See Storia della Letteratura Italiana del Tirabolco.

GUARINO (Lat. Tarinus), a learned Italian, born at Verona, 1570, went to Constantinople in 1588 to learn Greek under Chrysodromus. After his return, he taught in Verona, Padua, and Bologna, was tutor to Prince Lionello of Ferrara, acted as interpreter at the council of Ferrara, and died in 1640. He performed great services for the revival of classical studies; translated the first ten books of Strabo, and a portion of Plutarch; commented on Cicero, Persius, Juvenal, Martial, and Aristotle; and wrote a Compendium Grammaticae Graecae, which was printed at Ferrara in 1569.—Compare Rosmini, Vita e Disciplina di Guarino (3 vols. Brescia, 1805—1806).

GUATEMALA, the name of two cities in Central America.—1. Guatemala (Old) stands at the foot of Volcan d'Agua, in lat. 14° 30' N., and long. 90° 45' W. One of the natural capitals of the world, it was twice destroyed, first in 1614, by an eruption, and again in 1773, by an earthquake. Though, after the second disaster, it was supplanted by its modern namesake, yet it was, to a certain extent, rebuilt. It is seated on a high, arid, rocky plain, and many of its ancient buildings, more especially a cathedral and a palace, remain entire.—2. Guatemala (New), capital of the republic of the same name, is situated in a rich and spacious table-land, at an elevation of 4961 feet above the sea, in lat. 14° 37' N., and long. 90° 30' W. It is 24 miles to the east-north-east of the original capital, and contains 60,000 inhabitants. The people manufacture muslins, cotton-yarn, plate, artificial flowers, and beautiful embroidery, carrying on at the same time a prosperous trade in the agricultural productions of the neighbourhood. The place is well supplied with water by an aqueduct.

GUATEMALA, nominally a republic, but really an oligarchic state of Central America, terminates this division of the new continent towards the north-west, being washed at once by the Caribbean Sea and the Pacific Ocean. It stretches in N. lat. from about 14 to 17°, and in W. long. from 89° to 94°, containing 43,000 square miles, and 970,450 inhabitants. The surface presents great variety, mountains and valleys, plains and table-lands. The different levels, ranging from the sea-shore to an elevation of 5000 feet, have each its own climate and temperature. The country is subject to earthquakes, and abounds in active volcanoes. Being nearly as populous as all the other states of Central America put together, Q. popularly gave name, in the early days of independence, to the confederation which they temporarily formed; and, from the same pre-eminence, it had given name, under the Spanish domination, to a still more extensive region. The present ruler is Rafael Carrera, a revolutionist, who bears the title of Captain-general, and who in 1854 was made president for life, with power to name his successor. His government is 'reactionary, i.e., it is carried on in the interest of a absolute aristocracy and a debased, priestly religion; he has recalled the banished Jesuits, re-established the convents, reimposed the censorship of the press, and done his utmost to destroy every vestige of such 'liberalism' as the country manifested at the achievement of its independence. To extract a few particulars from official
GUAVA—GUBBIO.

Returns for 1858, the imports and the exports respectively amounted, in dollars, to 1,224,836 and 1,553,926—the trade with Great Britain, partly direct and partly through Belzue, comprising two-thirds of the former, and nearly three-fourths of the latter: while, taken in order of value, the articles imported were cottons, silks, woollens, hardware, ironmongery, linens, and jewellery; and the articles exported were cochineal, indigo, sugar, hides, country manufactures, sarsaparilla, and mahogany. The exportation of cochineal alone was 2,012,425 lbs., in quantity, while in estimated worth it far more than doubled all the other productions.

GUAVA (Psidium), a genus of trees and shrubs of the natural order Myrtaceae, mostly natives of tropical America, and some of them yielding fine and much valued fruits. They have opposite entire, or almost entire leaves, a 3—5-lobed calyx, 4—5 petals, and a 1—5-celled berry with many-seeded cells.—The Common G. or White G. (P. pyrifera) is a low tree of 7—20 feet, with numerous branches, obtuse smooth leaves 2—3 inches long, and fragrant white flowers on solitary axillary stalks. It is said to be a native both of the East and West Indies and is now much cultivated in both. It is not improbable, however, that it was introduced into the East Indies from America, but it has now become fully naturalised. Sir James E. Tennent says, it is to be seen in the jungle around every cottage in Ceylon. It has long been occasionally grown as a stove-plant in Britain. The fruit is larger than a hen's egg, roundish or oblong, smooth, yellow; the rind thin and brittle; the pulp firm, full of bony seeds, flesh-coloured, aromatic, and sweet. The jelly or preserve made from it is highly esteemed, and is now regularly imported into Britain from the West Indies and South America. The rind is stewed with milk, and is also made into marmalade. This fruit is rather astringent than laxative. G. linds, boiled with barley and liquorice, make a useful astringent drink in diarrhcea.—The Red G. (P. pinnatum), also now common in the East as well as in the West Indies, produces a beautiful fruit, with red flesh, but not nearly so agreeable as the white guava. It is very acid.—The CHINA G. (P. catleyanum), a native of China, produces fruit readily in vineyards in Britain. It is a larger tree than the other. The fruit is round, about the size of a walnut, of a fine claret colour, growing in the axis of the leaves; the pulp purplish red next the skin, becoming paler towards the centre, and there white, soft, subacid, and of a very agreeable flavour. It makes an excellent preserve. It succeeds in the open air in the south of France.—On some of the mountains of Brazil grows a dwarf species of G., called Marangaba (P. pyriformis), a shrub 1—2 feet high, with fruits about the size of a gooseberry, much sought after on account of its delicious flavour, resembling that of the strawberry.—The BASTARD G. of the West Indies is a species of Eugenia (q.v.).

GUAXICO. See OJACO.

GUAYAQUIL, a term of various application in Ecuador, South America, indicated by a title which, a bay, a department, and a city.—1. The river is the only stream on the western coast of South America which can, without qualification, be said to be navigable for going vessels. It is navigable for vessels of 400 tons for 220 miles above Guayaquil to the Pacific Ocean. Its mouth is 1,438 feet wide. Each vessel of this tonnage easily clears the bar, 300 yards wide, in three hours. The depth of water is at least 15 feet. It is strewed with breakers for about 30 miles, forming a very dangerous passage. The river is nearly 230 miles in length, and is navigable throughout its entire course for steamers of 500 tons. The coast is very level from Guayaquil to the Pacific. 2. The city of Guayaquil, the capital of the department of Guayas, is situated on the bank of the Guayas River, at the mouth of the river, about 6° north of the Equator, and 85° 40' west of the meridian of Greenwich. It is the chief town of the Department of Guayas, a province of the Republic of Ecuador, and the capital of the department. It is situated on the left bank of the Guayas River, in the south of the department. The town is built on a peninsula which is separated from the mainland by a channel of water about 200 feet wide. The town is about 4 miles long, and is about 1 mile wide. It is surrounded by hills, and is about 100 feet above sea-level. The climate is warm and pleasant, and the air is very healthy. The town is the seat of a cathedral, a bishop's palace, and a hospital. The population of the town is about 10,000. The town is the seat of a university, a college of law, and a college of medicine. The town is the seat of a mint, and is the centre of a large trade. It is the seat of a bank, and is the centre of a large trade. It is the seat of a mint, and is the centre of a large trade. It is the seat of a bank, and is the centre of a large trade. It is the seat of a mint, and is the centre of a large trade. It is the seat of a bank, and is the centre of a large trade.

GUAYRA, La, the principal seaport of Venezuela, in South America, stands on an open roadstead of the Caribbean Sea, in lat. 10° 36' N., and long. 67° W. It has a population of 6000, and carries on an extensive trade. In 1857, 230 vessels of 37,535 tons entered and cleared at the port; while the cargoes respectively were estimated at £586,436 and £474,324. More than one-half of the tonnage, and nearly one-fourth of the trade, were British. The imports, in value, were cottons (more than £160,000); sugar (more than £150,000), wood, wines, spirits, groceries, soap, &c., metals, flour, and linens; and the exports, according to a similar arrangement, were coca, straw-hats, timber, bark, hides, orchilla, tobacco, sarsaparilla, canes, India rubber, and coffee.

GUDBRO (anc. Ilupium), the chief town of a district of the same name in Central Italy, is beautifully situated on the south-western declivity of the Apenines, in the district of Urbino, and about 27 miles south of the city of the name. Pop. 8000. It contains several fine public edifices of
importance. On the most elevated point of the city, where the ancient fortress stood, is the ducal palace, so called from having been erected and inhabited by the Dukes of Urbino, who also governed Gubbio. The municipal palace is a noble old pile of building, erected in 1522 by Matteo di Gianluca, a native architect. In the palaces Brancalone and Beni are valuable pictures, collections of Etruscan and other antiquities. G. possesses several fine churches, and some excellent public establishments for sanitary and educational purposes. The most important ancient remains are the ruins of a theatre, supposed to have been destroyed by the Longobards, a temple of Mars, and an Etruscan sepulchre of great antiquity. At a short distance from G. are the ruins of the famous temple of Jupiter Apenninus; and here, in 1444, were discovered the famous Enguina Tables (q.v.).

GUBEN, a manufacturing town and river-port of Prussia, in the province of Brandenburg, is charmingly situated on the Neisse—the banks of which are here planted with vines— at its confluence with the Lubet, 23 miles south-south-east of Frankfurt. Except its gymnasium, it has no notable buildings. The principal manufactures are woollen goods and tobacco. The shipping-trade of the Neisse is of some importance; ship-building is also carried on. On the neighbouring heights, fruit-trees and vines are cultivated. The red wine produced here is esteemed one of the finest grown in the eastern portion of the kingdom. Pop. 13,517.

GUDGEON (Gobio), a genus of fishes of the family Cyprinidae, having a short dorsal fin, a short anal fin, and strong serrated rays within, the body covered with rather large scales, and barbules at the angles of the mouth. The Common G. (G. G. fluviatilis) is abundant in many of the rivers of England, particularly in such as have gravelly bottoms, and occasional pools and rapids. It seldom exceeds eight inches in length; the depth is not one-fifth of the length. The tail is forked. The eye is placed high up on the side of the head. The upper parts are olive brown, spotted with black; the under parts white. Gudgeons swim in shoals. They feed on worms, molluscs, and other small animals, and are extremely ready to bite at a bait, which is commonly a small piece of a red worm. Great numbers are often taken even by young anglers, and the readiness with which the G. is lured has become proverbial. The G. is much esteemed for the table. Many are taken with casting-nets in shallow water, and kept in well-boat till wanted. Fishmongers also keep them in tanks, constantly supplied with fresh cold water. They thrive well in ponds supplied with fresh water by brooks.

The G. is usually one of the first objects of the juvenile angler's ambition; and with a crooked pin and thread, with a fragment of a worm for bait, the angler often imbibes his first love of the art while catching his first gudgeon. The G. is very easily captured. Swimming in large shoals at the bottom, it rushes with incessant to the latest census, they were held up to general detestation is best shown by the position assigned them in most popular Mohammedan tales as sorcerers and criminals. At this present moment, there are, according to the very latest native information, about 8000 Gubres scattered over the vast dominions of their ancestors, chiefly in Yezd and twenty-four surrounding villages. There are a few at Teheran, a few at Isphahan, at Shiraz, and some at Bak, near the great napitna mountain, but all plunged in the depths of ignorance, and, with very few exceptions, of poverty. They have a high reputation for honour, probity, obedience to the law, chastity, and perseverance. Many species have been divided after various migrations—which are told at length in the Kium-i-Sanjij, written by Behram (1599 A.D.)—reached India, where they are now settled under the name of Parsees, chiefly in Bombay, where, according to the best calculations, the population of 110,544, or 20 per cent. of the whole population. See Parsees.

GUELDER ROSE, or GUELDER ROSE, a cultivated variety of the Water-Elder (Viburnum Opulus—see Viburnum), in which the flowers are
all barren, and instead of forming flat cymes, as in the wild plant, form much larger globose corymbs. It is sometimes called the Snow-ball Tree. When abounding in flowers, it is a very ornamental shrub, and is therefore often planted.

GUELDERLAND. See GELDERLAND.

GUELPHIC ORDER, an order of knighthood for Hanover, instituted by George IV., when Prince Regent, on the 12th August 1815. It is both a military and civil order, unlimited in number, and consisted originally of three classes—Knights Grand Cross, Knights Commanders, and Knights of Honour. To which the revised statutes of 1841 have added another class of simple members. The Grand Mastership is vested in the crown of Hanover. The badge of the order is a gold cross, surrounded by the Hanoverian crown—between each division of the cross is a lion passant gardant. In the centre is the horse courant of Hanover, surrounded by a blue circle, and the motto, Nec aspera terrae.

GUELPHS AND GIBELLINES, the names of two great parties, the conflict of which may almost be said to have swept the whole of Germany from the 11th till the 14th century. The origin of these names was formerly the subject of much speculation; but antiquarians are now agreed in tracing them respectively to the two families, Wolf, which, in the 12th c., were at the head of two rival parties in the German empire, and whose feuds came to be identified historically with the respective principles for which these parties contended. The actual origin of the names is commonly fixed at the great battle of Weinsberg, in Swabia, 1140 A.D., in which the two rival claimants for the empire, Conrad of Hohenstaufen, Duke of Franconia, and Henry the Lion, of the House of Wolf, Duke of Saxony, rallied their followers by the respective war cries, 'Hie Waihlingen!' 'Hie Wolf!' but it is certain that the names were in use from an earlier date, although, probably, rather as representing the family feud, than the political principles which the two families afterwards severally supported. As the chief theatre of the conflict of these parties was Italy, the original names took the Italian form of Ghibellini and Guelph. The former may, in general, be described as the supporters of the imperial authority in Italy, the latter, as the opponents of the emperors; and as the opposition to imperial authority in Italy arose from two distinct parties, which, for the most part, made common cause with each other—from the church, which asserted its own spiritual independence, and from the minor principalities and free cities, which maintained their provincial or municipal rights and liberties—the history of the struggle is involved in much confusion, and is variously related, and its merits variously appreciated, according to the point of view from which it is regarded. To the churchman, it is the struggle of the church against the state; to the friend of popular principles, it is the conflict of liberty against absolutism and centralisation. The same individual—as, for example, the poet Dante—is found to change sides in the struggle. For the most part, however, the interests of the church in Italy and Germany conflicted. His works, although regarded, as Publicans as excessive in degree, must be confessed to have fallen in with the claims of political and personal freedom. Five great crises in the strife of the Guelphs and Ghibellines occurred, and are commonly noted by historians: under Henry IV., in 1055; under Henry the Proud, in 1127; under Henry the Lion, in 1140; under Frederic Barbarossa, in 1189; and in the pontificate of the great champion of churchmanship, Innocent III. The cities of Northern Italy were divided between the two parties—Florence, Bologna, Milan, and other cities, as a general rule, taking the side of the Guelphs; while Pisa, Verona, and Arezzo, were Ghibelline. The great Italian families, in like manner, took opposite sides; but the policy of each family frequently varied from one generation to another. In general, it may be said that the nobles of the more northern provinces of Italy inclined to the Ghibelline side, while the church, the central and southern provinces, were Guelph. By degrees, however, especially after the downfall of the preponderance of the German emperors in Italy, the contest ceased to be a strife of principles, and degenerated into a mere struggle of rival factions; availing themselves of the prestige of ancient names and traditional or hereditary prejudices. Even in 1272, Gregory X. could, with truth reproach the Italians with their sanguinary anunnusions for the sake of what were to the Italian nation only the means of a political purpose.

GUERRA, or GERRARA, a town of Algeria, in the district of the Beni-M'zab, stands on the left bank of a river called the Zughir or Zegerin, in lat. 32° 45', long. 7° E., and about 40 miles north-east of Ghardaia. It is a walled town, has three gates, and is a favourite commercial rendezvous for all the neighbouring tribes, who frequent this place for the purchase or disposal of horses, asses, sheep, ivory, gold-dust, ostrich feathers, cotton, silk, cutlery, &c. The market of G. is supplied chiefly from Tunis and Algiers. The pop. is about 12,000.

GUERCINO, the squint-eyed, properly Gian-francesco Barbieri, a celebrated master of the Bolognese school of painting, was born in 1590 at Cento, a pretty town not far from Bologna.

GUERCINO. The word is thought to have been given to him by his father, who, it is said, squinted. It is generally explained by sketching with the roughest materials on the house-door a Virgin so full of artistic promise, that his father, in spite of the straitened circumstances of the family, took immediate measures for training the boy's talents, by securing for him the best tuition in drawing which the place afforded. In 1616 he opened an academy at Cento, to which pupils flocked from all quarters. From 1619 to 1623 he visited different cities of Italy, particularly Rome and Venice, to improve himself by the study of the works of other eminent painters. In 1642 he went to live at Bologna, where he died in 1666. Some of the early paintings of G. bear perceptible traces of his admiration of Caravaggio's style, both in their powerful effects of deep colouring and strong fidelity to nature, while they much surpass those of the great realist in dignity and refinement of tone. They are deficient, however, in accuracy of design. His works, although regarded, as Publicans as excessive in degree, must be confessed to have fallen in with the claims of political and personal freedom. Five great crises in the strife of the Guelfs and Ghibellines occurred, and are commonly noted by historians: under Henry IV., in 1055; under Henry the Proud, in 1127; under Henry the Lion, in 1140; under Frederic Barbarossa, in 1189; and in the pontificate of the great champion of churchmanship, Innocent III. The
of interest to those who visit the place. The church of Cento also contains several fine works of this master, who had an intense love for his birth-place.

GUERICKE, ORTO VON, a celebrated physicist, was born at Magdeburg, in Prussian Saxony, 29th November 1602. His personal history contains nothing of interest. As a natural philosopher, he is chiefly known by his discoveries regarding the nature and effects of air. The experiments of Galileo and Pascal on the weight of air led G. to attempt the creation of a vacuum. His first experiment was made by filling a stout barrel with air and then pumping out the water; but it was found that no sooner was a vacuum produced in the barrel than the air forced its way through. He now took a globe of copper, with an opening at the bottom into which a pump was fitted, provided with a stopcock, and to his astonishment found that the pump extracted the air quite as well as the water; then, on opening the cock, the air was heard rushing in with a whistling noise. This, the first air-pump, was invented about 1650. G.'s invention soon became famous, and in 1654 he was summoned to the presence of the Emperor Ferdinand III. of Germany. He went to Ratisbon, at which time he made the famous experiment commonly known as the Magdeburg Hemispheres (q.v.). He died at Hamburg, 11th May 1686.

GUERIN, PIERRE NARCISE, BARON, one of the most eminent historical painters of the French classic school, was born at Paris, 13th May 1774, and first attracted notice by his 'Pepys rapporté à Rome' (1796). Some of his pieces are regarded as master-pieces of the French classic school. The few portraits executed by G. are admirable. Among the latter may be mentioned two portraits of Henri de la Roche-Jacqueline stoning an intrenchment. In 1829 he was raised to the rank of baron, and died at Rome, 16th July 1833. Purity of design, dignity of style, taste in grouping, and harmony of all the parts which mark the classic school of painters is as visible in him as in others.

GUERITE, a small loopholed turret in the wall of a fortress, from which a sentry may command a view and fire over the ditch.

GUERNSEY, the second in size of the Channel Islands (q.v.), is situated in lat. between 49° 24' and 49° 39' N., and in long. between 2° 33' and 2° 41' W.; is distant 69 miles south-east from Start Point, in the south of Devonshire—the nearest point of the English coast—and about 46 miles south-west from Cherbourg, in France. Its length is 9 miles, its greatest breadth about 6, and its circumference 31 miles. In 1861 it had a population of 29,846. The coast is of difficult approach, owing to the number of rocks and the rapidity of currents around the island. The northern part of the island is flat, the southern more elevated, but intersected by deep valleys and gorges, and with a lofty and abrupt coast. St Peter's, on the south-east coast of the island, is the only town. For particulars about the climate, soil, productions, trade, &c., see JERSEY.

GUERRAZZI, F. D., a patriotic Italian statesman and brilliant writer, was born at Leghorn in 1801, and, educated for the legal profession, won a great reputation among his countrymen by his political writings, which are said to have exercised an immense influence on contemporary Italian events by their exciting strain of patriotic enthusiasm and abhorrence of despotism. G.'s 'own words and acts were a bright beacon in those times of doubt and battle.' On the eve of the definite breach between the people and the Grand Duke of Tuscany, in 1849, G. was induced to accept office in the ministry. On the flight of the Grand Duke, he was proclaimed member of the provisional government, and subsequently dictator. During this crisis of the state he energetically refused his adhesion to the substitution of republicanism for monarchy; discouraged the annexation of Tuscany to any other state; and, in fact, presented the strictest autonomy as the return of the Grand Ducal rule, when he was immediately seized and imprisoned on the grounds of having neglected due measures of repression when the revolution first gathered strength during his ministry. His defence, entitled Apologia della vita Politica di F. D. Guerrazzi, or 'Justification of the Political Career of F. D. Guerrazzi,' is a masterpiece. After an imprisonment of three years, he was condemned for life to the galleys, but was subsequently permitted to select Corsica as the refuge of his perpetual banishment. Late events have restored G. to liberty and action.

GUERRILLAS (diminutive of Sp. guerrero, war, literally 'petty' or 'partisan war,' or 'partisan warriors'), the name given in Spain to the armed bands composed of peasants and shepherds, who, on occasion of foreign invasion or civil wars, carry on an irregular warfare on their own account. From 1808 to 1814 they were regularly organised against the French, and being favoured by the character of the country, were successful on many occasions, especially at the commencement of the wars under Emperador, the Pastor Merino, Mina, and other leaders. The country itself suffered from the guerrillas, who revenged political treachery, or even the bare suspicion of it, by fearful devastations. Many of them, particularly Mina's band, joined Wellington, and after having undergone a course of discipline, rendered signal service as regular troops. In the recent civil wars of Spain, the guerrillas, especially those of the Basque provinces, acted a prominent part on the Carlist side.

GUESCLIN, BERTRAND DU, COUNT OF Longueville, Constable of France, the most eminent French general of the 14th c., was born of an ancient family in the district of Rennes, sometime between 1314 and 1320. As a boy, he was remarkably droll, and could never be taught either to read or write, but exhibited a passion for military exercises. In his 17th year he bore away the prize at a tournament at Rennes, and from this time was always successful in such encounters. In the contests between Charles de Blois and Jean de Montfort for the dukedom of Brittany, he took part with the former. After King John had been taken prisoner by the Black Prince at the battle of Poitiers, in 1356, G. rendered important services to the Dauphin, afterwards Charles V. He took Melun and several other fortified towns, freed the Seine from the English, and on Charles's accession to the throne, in 1364, was created governor of Pontorson. In May of the same year he gained the battle of Cocherel, and was rewarded by the title of Count of Longueville and Marshal of Normandy. On the 29th September he was defeated and taken prisoner by the English, under Sir John of Pontoise, at the battle of Auron, but liberated on payment of a ransom of 100,000 livres, paid by the king, the pope, and several other princes. He now supported Henry, Count of Trastamare, against Pedro the
Crusii, king of Castile, but was defeated and taken prisoner by the Black Prince. Being again ransomed on payment of a large sum, to which even the enemy contributed from feelings of respect, G. repaired theodest, and in 1369 defeated and slew Pedro, and placed the crown of Castile on the head of Henry of Trastamara. As an acknowledgment of his services, Henry created G. Count of Burgos, Duke of Molina, and Constable of Castile. He was, however, soon deposed by Charles III., who at that time had pressed by the English, and raised by that monarch to the dignity of Constable of France. In the year 1370, G. opened his campaigns against the English, and in a short time the whole of their possessions were in the hands of the French, with the exception of a few fortified towns. While assisting his friend Sancerre in the siege of Châteauneuf de Randon, in Languedoc, G. was taken ill, and died July 5, 1380. Charles V. caused him to be interred with great pomp beside his own burial-vault at St Denys.—Compare Guyard de Berville, Histoire de Bertrand du Guesclin (2 vols., Paris, 1767).

GUGLIELMI, PETRO, a celebrated musician and composer, was born at Massa di Carrara in 1530. His father, who was Maestro di Cappella in the ducal chapel of Modena, he acquired the elements of music. His first opera, composed at the age of 28, was performed at Turin, and was greeted with enthusiasm. Previous to settling out on a continental tour he visited the chief cities of Italy, and was everywhere successful. After a residence of some months at Dresden, Vienna, and various other towns, G. passed over to London, where he remained five years, assiduously engaged in composition. At the close of his return home to Naples he condescended to the double prestige of great fame and wealth. In 1793, Pope Pius VI. appointed him Maestro di Cappella at St Peter's, and from that time his official duties seem completely to have engrossed him. He died at Rome in 1804. The characteristics of his style are pre-eminently simplicity, purity, and precision, and these qualities he inextorably demanded from the exponents of his inspiration—Sing my music and not mine! His best known operas are:—La Clemenza di Tito; Artaserse; La Didone; Enea e Lucrezia; La Morte di Ol涧erone; Debra e Sierca; and the comic operas La Virtuosa di Mergellina; I due Genii; La Serse Immuratora; La Pastorella; Nullo Buon Principe; and Belus Preseitore.

GUIANA, British (Fr. Guyane, Sp. Guayana, Port. Guiana), a section of the extensive tract forming the northern-eastern portion of South America, lying between 8° 40' N. and 3° 30' S., and between the meridians of 50° and 68° W. The greatest length of this tract, from Cape North to the confluence of the river Xie with the river Negro, is calculated at 1900 miles; its greatest breadth, between Punta Barima, at the embouchure of the river Orinoco, and the confluence of the river Negro with the river Amazon, at 710 miles. It is at present politically divided into Venezuelan, British, Dutch, French, and Brazilian Guiana. The name G. is usually supposed to have been applied by the Dutch to the whole country from the name of a small river Water on the left bank of the Negro, on which stands a small town, called Guayana Vieja.

The limits of the British possessions have never very accurately been determined. If we adopt the idea of Sir Robert Schomburgk, the latest authority upon the subject, and assume the natural indications to be the proper guide to the geographical boundaries, we shall include all the regions drained by the waters falling into the river Essequibo; and taking the river Corentyn as the acknowledged line of demarcation between British and Dutch G., we arrive at an area of 76,000 square miles, a territory much larger than England and Wales. If, on the other hand, we consider the Dutch and Brazilians governments respectively as to be admitted, the British portion will be reduced to something above 12,000 miles, and become the smallest of the European colonies in this region.

The British territory consists of an alluvial flat, composed of a blue clay impregnated with marine salts, and mixed with decayed vegetable matter, which, in its decomposed state, forms a rich and highly productive soil. The inland depth of this fertile coast varies from ten to four feet, where it is bounded by a range of sand-hills, varying in height from 30 to 120 feet. In the fifth parallel N. lat. occurs a chain of mountains composed of granite, quartz, and trappean rocks, with various modifications, and it has been conjectured that it was the ancient boundary of the Atlantic Ocean. A peculiar feature of the interior is the savannas extending between the rivers Demerara and Corentyn, and the river Berbice closely approximating the sea-shore. There is another series of such savannas further inland, and the geological structure of the region indicates that it was once the bed of an inland lake, which, by some great elemental disturbance, burst its barriers, and directed its waters a passage to the Atlantic. This supposition may throw light upon the origin of the White Sea and the city of the gold-bespinkled Manoa, which inclined the ardour of the chivalric Ralegh and led him to the pursuit of the discoveries by which his name has been immortalised.

The fluvial system of British G. consists mainly of four great and seven smaller streams, the whole of the first named and six of the latter pouring their waters directly into the Atlantic. The four great rivers are the Essequibo (q. v.), the Demerara (q. v.), the Berbice (q. v.), and the Corentyn (q. v.). The smaller streams are the Pomeroon, the Mura, and the Wai-ini, between the Berbice and Essequibo; the Mahinaca, the Mahalicona, and the Atany, between the Demerara and the Berbice; and the Canje, which joins the latter immediately before it falls into the ocean. In addition to the foregoing, there are numerous creeks of considerable size, formed by the surplus waters of the savannas behind the sea-coast.

All these streams are continually bringing down quantities of detritus; the coast outline is consequently undergoing perpetual changes: in one place the drainage of the estuaries is blocked up by banks of drift mud; in another, incessant exertion is required to repel the encroachments of the sea.

Climate.—The climate of G. is genial and equable, and for a tropical country comparatively healthy. The thermometer ranges from 90° to 75° F., the mean temperature being 81° 22" F. The barometric pressure—highest, 30°05" inches; lowest, 29°74" mean, 29°916.

History.—Whether Christopher Columbus himself ever actually landed on the shores of G. seems not to be positively ascertained. It is, however, certain that the Spaniards must have settled in the neighbourhood of the 16th, and perhaps as early as in 1566, when the Dutch began to establish themselves on the banks of the Pomeroon and other rivers, they were speedily driven out by the Spaniards, nor was it until the latter succeeded in obtaining a footing on the river Essequibo. During the 17th and the early part of the 18th centuries, the Dutch were frequently harassed by incursions of the French and by internal insurrections: three distinct colonies were constituted, until, in 1793.
GUYANA.

Those of Essequibo and Demerara were united. Berbice remained a separate colony until 1831, when the three were constituted into the colony of British Guiana, consisting of the counties of Demerara, Essequibo, and Berbice.

Towards the close of the 18th c., the feelings of the inhabitants had become strongly influenced by a desire to place themselves under British sovereignty, and in 1796 effect was given to that desire by the act of the Hollanders under Major-general Whyte. At the peace of Amiens, in 1802, however, the colonies were restored to the then 'Bavarian republic,' to be again surrendered to Great Britain in 1803, which was finally confirmed at the peace of Amiens.

Government.—The political constitution of the colony has undergone but little modification since its affairs were administered by the Dutch. It retains peculiarities which distinguish it from that of any other colonial dependency: the principal variations introduced have been the division of the colony into electoral districts; a new definition of the qualification for holding the electoral franchise; and open instead of secret voting. The electors return members of two distinct bodies; one is termed the 'college of electors,' seven in number, who hold office for life, unless they quit the colony; the special function of this body will be to nominate by lot, from among the numbers of candidates put forward by the other body, one or more to be termed the 'college of financial representatives,' and consists of six members. The legislative body comprises ten members, five of whom, including the governor, who personally presides over its deliberations, are nominated by the crown, and hold office under it, the remaining five are chosen as vacancies occur by the existing members of the court from a double nomination sent up by the college of electors before described. Once in each year, what is called the 'combined court' holds a session for the purpose of agreeing upon the annual expenditure, and determining the nature and amount of the taxes to be levied. This court, which is also presided over by the governor in person, consists of the court of policy 'combined' with the college of financial representatives, and its legislative functions are confined to passing the annual tax ordinance. Practically, in the legislative body, or court of policy, the governor is able to carry any measure he desires, possessing, as he constitutionally does, a double vote; but it is hardly necessary to add that this power has been very sparingly resorted to, and the same may be said of the power of vetoing any proposition brought forward either in that or the combined court, should he deem it objectionable. The direct responsibility of the governor to the crown for any and all of his acts, has been found in practice an ampler safeguard against any abuse of these large prerogative powers. Another privilege reserved to the governor is that of originating all money votes; and while the majority in the combined court may reduce, they are prohibited from increasing the amount of any item of the public expenditure as annually settled.

The judicial system of the colony continued until a comparatively recent period, to be as it was established by the Dutch. The British claimed the right of trying cases of the civil and criminal tribunals on the basis of the administration of justice in civil matters. Trial by jury in such cases, at the option of either party, was introduced in 1844; and in criminal cases, the trial by jury was established by law in 1846, and the English criminal code was adopted as the law of the colony.

Besides the supreme and inferior courts, presided over by judges, there are police and stipendiary magistrates in each town and district, with the ordinary powers of summary jurisdiction; a jail in each county, and a penal settlement for the more heinous classes of criminals, situated on the banks of the river Massaruni, about 70 miles from Georgetown. The stipendiary police consists of about 300 men, and there is a strong body of rural constables throughout the colony, consisting usually of the most trustworthy men on the estates, and in the villages, without distinction of race.

There are but two towns, properly so called, in the colony—George Town (q. v.) and New Amsterdam (q. v.).

The cultivated portion of the colony is confined to the sea-coast, and to a short distance up each of the rivers Berbice and Demerara. The many estates laid out by the Dutch in the shape of a parallelogram as nearly as circumstances would permit, and the staples were sugar, and its contingent products rum and molasses, cotton and coffee. In 1747, two schooners sufficed to carry to Europe the crop of 559 half-hogsheads of sugar; in 1762, the culture of cotton and coffee commenced. Immediately after the conquest by the British in 1796, a great impetus appears to have been given to agricultural operations; since that period the fluctuations, arising no doubt from various causes at different times, have been considerable, of which some idea may be perhaps arrived at by glancing at the gradual decrease of the numbers of slaves holding land in 1831, upon which there were altogether 322, there are now not more than 169. Cotton and coffee have entirely ceased to be exported; the former is not cultivated at all, the latter to a very trifling extent. All available resources have been concentrated upon the production of sugar and rum; molasses have much diminished in quantity, owing to the improvement in the manufacture of sugar. By the introduction of improved machinery, and an accession of labour by means of immigration, the produce of this colony has been increased from 50 to 100 per cent. The timber-trade has also assumed a vastness of proportion never dreamed of in years gone by, and for this the colony is mainly indebted to the interest excited in its natural resources, by the Great Exhibitions at London in 1851, and Paris in 1855.

The settled population of the colony has been ascertained by the recent census (April 8, 1861), to amount to 147,767, exclusive of the aborigines, the troops in garrison, and the seamen afloat. As the increase of about 20,000 since 1851, is more than accounted for by the net results of immigration during that period, it seems to follow that the native or Creole population has rather receded than advanced, a circumstance which, especially as it is believed to be borne out by the experience of some of the smaller West India insular colonies where immigration has had little or no influence, is matter of serious concern. It is, however, to be remembered, that in the interval the colony has been visited by epidemic cholera and small-pox, both extensively fatal, especially to the aged and the young.

The population is of a singularly diversified character; the aboriginal Indians, many of whose tribes are rapidly becoming extinct, are supposed to number from 7000 to 10,000, within the limits of the colony. The British, the native or Creole population, the British and Dutch, are, in the main, of a mixed race; the immigrants from Madeira, from the East Indies, and from China, crowned by a sprinkling of Europeans, chiefly British, French, and Dutch. The total number of the immigrants of all races introduced from 1835 to 1860 inclusive, is 89,438. On the 30th June 1861, there were 27,000 under indenture on the several estates.

For ecclesiastical purposes, the colony is divided into 17 parishes, of which seven belong exclusively
GUIANA.

to the Church of Scotland, and eight exclusively to the Church of England, while the two in which the position was taken, have a minister of each church appointed to them. The ministers of both churches, with those of the Roman Catholic Church and the Wesleyan Church, are maintained by salaries from the public chest, secured by law for a term of years. There are also independent missionaries scattered throughout the colony, who are supported exclusively by the voluntary contributions of their flocks. The expenditure for the maintenance of school-houses, salaries of teachers, and of an Inspector, and incidental expenses, may be quoted for 1861, at £12,000 sterling.

The actual position of this important dependency, as contrasted with what it was twelve years ago, may be described as one of advancing prosperity; but until a still more ample supply of available labour induces a greater influx of capital, it cannot be asserted that its condition is positively safe and satisfactory. Like the other sugar-producing colonies of Great Britain, it has had to struggle against great difficulties—partly, at least, arising from imperial legislation; it has still to contend with fiscal burdens in the shape of a scale of duties increasing in amount in proportion to the superior quality of the colonial article manufactured, thus operating as a discouragement to its production, and with an expensive system of recruiting the deficient labour-market from distant regions.

The revenue for 1861 was £87,462; the expenditure, £87,462; the balance, £87,462. This was enacted, by way of compensation to the shareholders, that the negroes should work gratuitously as apprentices to their former owners for a period of 12 years.

The Dutch, who were the first European settlers in Guiana, organised trading stations on the coast as early as the year 1580, from which period till 1790, when Demerara and Essequibo fell into the hands of the English, they retained possession of most of Guiana. The present limits of Dutch Guiana were settled by the Congress of Vienna.

GUIANA, FRENCH, includes the districts lying between 2° and 6° N. lat. and 51° and 54° W. long., and is bounded on the N. by the Atlantic; on the W., by the Maron, river, which separates it from Dutch Guiana; and by the little known districts lying beyond the Rio Branco; and on the S. and E. by the river Oyapock and the range of the Tumucumaque mountains, which separate it from the Guiana and Brazilian territories. The area, the best French authorities (Block, &c.), is 18,000 square leagues, but the boundary-line of French Guiana is not well defined, and is at the present time (August 1862) in dispute between the French and Dutch governments. Pop. (1858) 21,440.

In addition to the continental districts, French Guiana comprises several islands in the immediate vicinity of the coast, the principal of which are Cayenne, in which is situated the capital of the same name, Le Grand Comtéble, and Le Petit Comtéble. The country is divided into high-lands and low-lands, the former of which commence at the first cataracts of the rivers, and gradually increase in height towards the central districts, which they traverse in a granitic mountain-range, which nowhere exceeds an elevation of 1000 feet. The low alluvial lands, which extend from the cataracts to the Atlantic, are at present mostly covered with vast forests, but the soil is well adapted to the cultivation both of, grain of every kind, and all the products of tropical vegetation. Among the 20 navigable streams or rivers, the principal are the Maron, lying to the west, and the Oyapock to the east of Cayenne, the navigation of which is rendered difficult from the numerous cataracts and rapids with which they are obstructed. The overflowing of the rivers gives rise at various points in lower French Guiana to swamps or marshy lakes, which are covered with forests of mango-trees and palms, while in other parts lakes are formed, the
most extensive of which are those of Mapecucu, Macari, and Mapa.

French G. has a rainy season, which lasts with short interruptions from November to June; and the heat is less oppressive than in most places in the West Indies, in consequence of the influence of the trade-winds, which bring with them the temperate moisture of the Atlantic. The thermometer rises to 70°

The chief products and exports are choice woods for ornamental purposes, rice, maize, coffee, cacao, sugar, cotton, nutmeg, cloves, and pepper.

French G. or Cayenne, which was first occupied by France in 1604, is now divided into 14 communes comprised under the two cantons or districts of Cayenne and Sinnamary, and placed under the command of a governor assisted by a privy-council. The French budget for 1858 stood charged with the sum of 131,360 francs for ordinary expenses of government in Guiana, and 2,000,000 francs for the penal settlements at Cayenne. The administration of justice is centered in the tribunal of the Imperial Court at Cayenne, the chief town of the province, and is under the jurisdiction of a president, assisted by counsel, auditors, and notaries. There are 9 free elementary schools in the colony, giving instruction to 1100 children, which are under the supervision of the Bishop of the Roman Catholic Church, of which the majority of the population are members, although various forms of faith are tolerated, and supported at the charge of the state.

In accordance with an imperial decree of 1854, Guiana has been made the principal seat of the penal settlements of the mother-country, which are maintained at Cayenne at the national charge. All persons sentenced to 8 years' hard labour, are confined, on the expiration of their sentence, to reside for the remainder of their lives in the colony, unless when specially pardoned by the emperor, in which case they are seldom allowed to return to France. Grants of lands, with the restitution of civil rights, may be recorded by the local authorities as a remuneration for good conduct; but the discipline is in all cases severe, and the labour heavy and continuous. The mortality among the prisoners is believed to be very great, but the French government has endeavoured to conclude the death-rate of G. in its otherwise very full tables of mortality.

GUIANA BARK, FRENCH, the bark of Portlandia hecandra, also called Couteria speciosa, a tree of the natural order Cinnonaceae, with opposite oval leaves, and corymb of very large purple flowers, found in Guiana. This tree is esteemed a very powerful febrifuge, and the value of the widely known medicine, called Warburton's Fever Drops, is believed to depend mainly upon it.

GUICCIARDINI, Francesco, an Italian statesman and historian, was born of noble parentage at Florence in 1492. The combined studies of law and literature engrossed his earliest attention, and were cultivated with such signal success, that before he reached the age of 23, he was elected professor of law by the Signoria of Florence, and acquired, at the same time, a reputation of great skill as a legal practitioner. His knowledge of international law, and tact in the conduct of public affairs, caused him to be selected in 1512, by the Signoria, as ambassador to the court of Ferdinand, king of Aragon. During a period of two years, he discharged his diplomatic duties with consummate ability. On his return to Florence, he was received with every mark of public approval, and in 1523 was despatched by the republic to receive at Cortona Pope Clement VII. during the interregnum of the Pope, and afterwards to convey the money only of the land of Bologna. On the accession of Paul III., G. resigned all his dignities, and after 18 years of papal service, returned to Florence, where Alexander de' Medici had just been thrust on the citizens as their sovereign by Charles V. On the assassination of Alexander, G. promoted materially the elevation of Cosmo de' Medici; but meeting with no special favour from that prince, he withdrew from Florence to his villa at Arceti, where he commenced his famous work, La Storia dell'Unità. He died in 1540, before its completion. In 1561, 21 years after his death, the first sixteen books of his history were published, and three years later, four additional books appeared. The work is considered a standard of classical historical writing, independent of its value as a minute and faithful record of the period it embraces, from 1490 to 1534. A magnificent Italian edition was published at Freyberg 1775—1776, 4 vols. 8vo, in accordance with the manuscripts deposited in the Magliabechi library at Florence, and another at Pisa, 1819, ten volumes 8vo, edited by Rosini. Recently (1857—1858), there has appeared at Florence Opere istoriche di Francesco Guicciardini, in 6 vols. 8vo, and discourses on the Florentine Institutions, in the form of dialogue, recovered from the manuscripts in the family archives.

GUIDES, in military affairs, are usually persons drawn from the country in which an army is encamped or lodged. A body of invalids is collected at head-quarters, to enable one or more to be sent with every detachment of troops which leaves the camp. A guide should be quick of eye, experienced in the topography of the country, and, above all, faithful. As, however, guides must on most occasions be drawn from the midst of a hostile population, and have probably only a pecuniary interest in serving well, their conduct is always watched with the utmost jealousy, being generally awarded as the punishment for the least departure from trustworthiness. Any treason or incompetence on the part of a guide might involve the most disastrous consequences to a whole expedition. In the French army, considerable number of the officers and infantry bear the name, but the name only, of 'guides.' They were first formed in 1744, as a small company of messengers on active service. The number was gradually increased until the time of Napoleon I., who formed them into a guard 100,000 strong.

GUIDO, Alessandro, an Italian poet, was born at Pavia in 1560. Literature and poetry engrossed his earliest attention, and to the taste and ability of his first pieces, he owed the notice of the Duke of Pavia, whose favour he further secured by the talent he evinced in setting his verses to fine spirited airs of his own composition. In 1685, with the sanction of the duke, he set out to Rome, where his kind patron assigned him apartments in the Farnese palace. He was fortunate enough to obtain the friendship of Christina, queen of Sweden, and composed, at her desire, the pastoral drama of Eutimone, the princess, intending to be his humble labourer in the work. He died at Rome in 1717. The dramas of G. fail in sweetness and affectation, but are interesting and elevated in sentiment. As a lyrical poet, G. ranks very high.

GUIDO ARETINO, so called from his birthplace, Arezzo, was a monk of the Benedictine order, and flourished about the year 1091. The exact date of his birth or death is known. He has the
re-orientare

with the intuitive foresight of genius, he instantly, we are told, comprehended the fitness of these sounds to form a new and perfect system of solfeggio, and forthwith proceeded to mature and systematise this idea. On introducing his new theory into practice among the youthful choristers of the monastery, the experiment proved entirely successful. The fame of G.'s musical invention drew upon him the attention of the pope (John XX.), who invited him to Rome. G. repaired thither, and obtained a very gratifying reception. The pope himself found pleasure in becoming a student of the new system, under the guidance of its founder and teacher. Ill health, however, compelled G. to return to the pure and bracing climate of his birthplace, and, re-entering the monastery of Pomposa, he there tranquilly ended his days. G. has left some interesting writings, explanatory of his musical doctrines, viz., the Micrologus; and the Argumentum Novi Cantusickeni.

GUIDO RENI, a celebrated painter of the Bolognese school, was born at Bologna in 1575, and first attained conspicuous strength of Caravaggio's creations, but subsequently followed the more refined and ideal school of the Caracci, previous to finally striking out a style for himself. His works are of extremely numerous, and the power and purity that reflect a sentiment of fervent spiritualism, more characteristic of the devotion of the early Bolognese school, than of the later spirit infused by the Caracci, the founders of the modern standard of Bolognese art. G. was unhappily an infatuated gambler, and with the view of replenishing his often-squandered finances, produced with extreme rapidity many inferior works undeserving his name. He died in 1642. Amongst his best productions are, 'The Crucifixion,' a magnificent work in the Vatican Museum; the 'Crucifixion,' in the church of St Lorenzo, in Lucina, Rome; and the famous 'Portrait of Beatrice Cenci,' one of the most interesting paintings in Rome. The ' Aurora' of G., on the roof of one of the halls of the Rospigliosi Palace, is a fresco of world-wide fame, and is considered the greatest of his works.

GUIDON—The standard borne by regiments of light cavalry; it is broad at one end, nearly pointed at the other, and usually of silk.

GUiENNE, the name of one of the 22 provinces into which France, previous to the Revolution, was divided. It comprehended the territory now formed by the departments of Gironde, Lot, Dordogne, Aveyron and portions of Tarn-et-Garonne, and Lot-et-Garonne, and formed with Gascony (q.v.), what was originally the country of Aquitania, of which name G. is a corruption. Its earlier history is described under Aquitania (q.v.).

GUIGNES, JOSEPH DE, born at Poitiers, 19th October 1721, acquired a great reputation as an orientalist, at a time when the acquisition of Eastern languages was a matter of no small difficulty. Chiefly on account of his thorough knowledge of Chinese, he was appointed interpreter for oriental

languages in the Bibliothèque du Roi. G. died at Paris, 29th March 1800. His great work, L'Histoire Générale des Langues Orientales, published at the expense of his family, and of Tartsæ, who contributed to the new edition, the Bibliothèque Orientale of D'Herbelot (1777—1779).—His son CHRISTEN-LOUIS-JOSEPH, born at Paris, August 25, 1759, was also a very distinguished oriental scholar, and published a Chinese Dictionary (Paris, 1815), by the orders of Napoleon I. He died at Paris, March 9, 1845.

GUILLAUMIN, a genius of shrubs of the natural order Lepinsmites, sub-order Ceanthepnia, having purple flowers and remarkable fibres of their seeds, the coating of which is so silicious that they are said even to strike fire with flint. The seeds are used for beads and for children's marbles. G. Bondoc is the best known species, and is of very wide distribution, although, like the rest of the species, growing only in the warm parts of the world. It is called the Bondoc, and the Nickor Tree, and its seeds, which are often thrown shore on the coasts of Scotland and Ireland, are called Malouca Beans. The cotyledons are very bitter, and are much used in India for the cure of intermittent fevers.

GUILDFORD, a market-town, and parliamentary and municipal borough of England, capital of the county of Surrey, is situated in a depression in the North Downs, on the navigable river Wey, 30 miles south-west of London. Here the Reading and Reigate Branch of the South-Eastern Railway crosses the Direct Portsmouth line. The town consists mainly of one street, running along the steep east side of the Wey, crossed here by an old bridge of four arches, and is distinguished by a remarkable air of order and cleanliness. Its streets are rich in quaint old gables, overlooking panoramic views, flanked by tall and long latticed windows. The chief buildings are the castle, a fine ruin, in the early Norman style; Archbishop Abbot's hospital, in which reside a master, 12 brothers, and 8 sisters; the church of the Holy Trinity, with several memorable monuments; St Mary's, an interesting specimen of the Transition style, and one of the oldest and most remarkable churches in the county; the Grammar School founded by Edward VI.; the town-hall; and the corn-market. G., at an early period the seat of considerable cloth manufactures, is now chiefly famous for its grain market, the 'Surrey wheats' being deservedly celebrated. It has paper, powder, and corn-mills; brewhouses, brickfields, ironworks, and two woolen manufactories. It also sends two members to the House of Commons. Pop. (1861) 8922.

This ancient town is first mentioned by name in the will of one of its citizens, Robert G., 1250, bequeathing the manor of Ethelwold to his nephew. In the time of the Conqueror, the town and manor were included among the demesnes of the kings of England. Henry II., John, and Henry III. frequently resided here.

GUILDHALL, an important public building in London, which may be regarded as the town-hall, and is the place of assembly of several courts, as the Court of Common Council, the Court of Aldermen, the Chamberlain's Court, &c., and a police-
GUILDS—GUILLEMOT.

court presided over by one of the aldermen. The Guildhall of London was formerly situated in Aldershambury. The original building was erected in 1181, but was almost wholly destroyed by the Great Fire of 1666. In 1789 the Guildhall was rebuilt in its present form. The hall proper is 163 feet in length, 48 in breadth, and 55 in height. It has been famous for centuries for the magnificence of its civic state. The alderman, in a Guildhall, where it was for this purpose was in 1500 A.D., when Sir John Shaw, goldsmith, who had been knighted on the field of Bosworth, gave here the first lord-mayor's feast. These feasts had formerly been held at Queen's Hall.

GUILDS (Sax. gildan, to pay). Guilds were originally associations of the inhabitants of particular towns, for promoting the common interests of the fraternity. They are said to be of Saxon origin, but unquestionably similar institutions existed at a very early period among the southern nations of Europe, where they were known by the name of Confraternities. In England, guilds were in use during the Saxon rule, and several records are preserved of the existence of these institutions. A guild is a society of trade, of which the object of the latter was the advancement of the commercial interests of the fraternity. In order to the establishment of a guild, religious as well as secular, it was necessary that it should receive the sanction of the sovereign; and in the reign of Henry II. several guilds were subjected to heavy fines, as having been established without that authority. In London, there were a large number of religious guilds. In the reign of Richard II., a guild to the honour of St. George the martyr, consisting of an alderman, master, brothers, and sisters, was established in Norwich; and here, it may be observed in passing, that the term alderman was a name for a chief citizen of the city. The title was extended to an officer of a burgh on the extension of guilds, as noticed below. It having been an orderly virtuous society for the space of thirty years from its erection, King Henry V. confirmed it by letter-patent under the Great Seal, made it perpetual, and granted it certain privileges and immunities (Madox, Firma Burgi). In like manner, guilds were formed in Bristol, Exeter, and other large towns. These guilds, through the munificence of individuals, by degrees amassed considerable wealth. By Henry VIII. the property and revenues of these religious guilds were seized and perpetually vested in the crown.

The most important branch of this subject is that of the secular guilds, or, as they were styled in the south of Europe, confraternities. These institutions were the germ of the modern burghs or municipal corporations. They consisted originally of the members of some particular trade, united for the purposes of mutual assistance in sickness, and for maintaining the interests of the trade. Thus we have the guild of goldsmiths, of weavers, of wrightsmen, of patten-makers, of spectacle-makers, &c., the names of which are preserved to the present day. Every trade had its separate guild, of which it was necessary that a man should be a member before he was allowed to practise the particular craft. As trade increased in importance, the influence and power of the guilds increased in proportion, until at length the towns or united guilds claimed from the sovereign special rights and privileges—quod habeant gildam mercatorum. The town of Southampton received a charter confirming such privileges as early as Henry II. Liverpool was made a gilda mercatoria by Henry III. In the reign of Henry VI., the title used was communia perpetua or corporata, which phrase has continued to be used in the modern corporations. This mode of conferring privileges has been borrowed from the continent, where, under the title of communities, the towns at a very early period obtained charters declaring their independence, and bestowing on them extensive privileges—See Robertson's Charles V., and Maddox, Firma Burgi.

The exclusive privileges of English and Scottish guilds or corporations are now abolished, as being contrary to public policy; and these associations exist only for mutual beneficial purposes. Thus, in various boroughs in England, a custom had long prevailed, and by-laws had been made, to the effect that no person, not being free of the borough or of certain of the guilds, should promise for merchandise, or exercise certain trades within the borough; but since 1835, when the Municipal Corporation Reform Act (5 and 6 Will. IV. c. 76, s. 14) passed, every lawful occupation is free, notwithstanding as such persons as are members of the exclusive privilege of trading in Scotch burghs was abolished by the statute 9 and 10 Vict. 17. For the functions of the Dean of Guild in Scotch burghs, see DEAN OR GUILD.

GUILLEMOT (Uria), a genus of web-footed birds, of the group Brachyptera (q.v.) or Divers, and included by Linnaeus in the genus Colymbus (see DIVER), but now more generally ranked among the Alcidae (see AUK) than among the Colymbidae (q.v.). The bill is moderately long, straight, and pointed, as in Colymbus, but rather more compressed, and covered with feathers as far as the nostrils; the feet, as in the other Alcidae, are three-toed, having no hind-toe, and entirely webbed. The legs are placed very far back, and are very short, the tibia scarcely appearing beneath the abdomen, so that they are ill adapted for walking, and the posture of the bird on land is erect, even when hatching its eggs. The tail is moderately broad, and is tipped with white, and is moved with great frequency in flight, which, however, the guillemots are able to sustain remarkably well, in consequence of the abundant provision made for aeration of the blood by their very large air-cavities. On the same account, they usually float very high in the water, though, when danger approaches, they can sink their bodies under water, till the head, neck, and upper part of the back are alone visible. They excel in diving, and use their wings for progression under water, where they seek their food, which consists chiefly of small fishes and crustaceans. They are seldom seen in the seas of warm latitudes, but are extremely abundant in those of the arctic regions and the colder parts of the temperate zone, particularly in the neighbourhood of rocky coasts. The Common G., or Foolish G. (U. trolle), is abundant on many parts of the British coasts, breeding even on those of the south of England, although a warm summer may cause the winter. It abounds in all the arctic regions. Its winter migrations extend as far south as the Mediterranean, and in America to New York. It is called Foolish G., from its often suffering itself to be taken by the hand rather than leave the cliffs on which it breeds, and where prodigious numbers may be seen stationed close together on the ledges of rock. The parent birds are said to carry their young on their backs from the high ledges to the
and remarkably large, being more than three inches long. If the egg is destroyed or taken away, another is laid in its stead. The egg is esteemed a delicacy, but the flesh of the bird is coarse. The skin with the feathers is used for clothing in some northern regions. Young birds and eggs are among the objects in pursuit of which the rock-fowlers of the northern coasts scale or descend the most tremendous precipices. Great numbers of the eggs are exported from the coasts of Newfoundland and Labrador.—The Black G. (U. gyra) is a smaller species, about 14 inches long; the plumage entirely black in summer, except a large white patch on each wing; but in winter, the under parts are white; the young are mottled or spotted. It is not common on the southern coasts of Britain, but breeds on many of the Scottish islands. It is plentiful in the arctic regions, and is as common in America as in the Old World. It has been called the Greenland Dove. It lays three eggs, often on the bare rock; but if the situation is damp, it piles up for them a curious nest of pebbles.—Other species are enumerated among British birds, but are rare. Several species are peculiar to the northern parts of the Pacific Ocean.

GUILLOCHE, an architectural ornament of Greek origin. It consists of two or more bands or ribbons, crossing and recrossing one another in a regularly repeating pattern. Some of these are simple (see fig.), and some very complicated.

GUILLOTINE, the instrument of decapitation introduced during the French Revolution by the Convention, and named after its supposed inventor, Joseph Ignace Guillotin, a physician (born 1738—died May 26, 1814), who, however, it is ascertained, was only the person who first proposed its adoption. It is composed of two upright posts, grooved on the inside, and connected at the top by a cross beam. In these grooves, a sharp iron blade, placed obliquely, descends by its own weight on the neck of the victim, who is bound to a board laid below. The speed and certainty with which this machine separates the head from the trunk, gives it a great superiority over the axe or sword. The invention of machines of this kind is ascribed to the Persians. In Italy, from the 13th c., it was the privilege of the nobles to be put to death by a machine of this kind, which was called Mancina. Couradin of Swabia was executed by such a machine at Naples, in 1268. An instrument resembling the guillotine was likewise employed in Germany during the middle ages. During the 17th, and till late in the 18th c., a machine called the Maiden, which differed but slightly from the guillotine, was employed in Scotland for the purpose of decapitation. That such an apparatus was known and used in France at an earlier period, is proved by the execution of the Duc de Montmorncy, who is described as having been executed by a falling axe at Toulon, in 1632. The Dutch, too, in the 18th c., employed a decapitating machine in executing slaves in their colonies.

GUILLINDEX, an ancient instrument of the Inquisitions employed in the 17th and 18th centuries. It consisted of a board, or platform, mounted on wheels, and upon which the prisoner was placed, standing on his head. The board was then placed obliquely over a sharp axe, the sharp edge of which cut the victim's neck, when the board was suddenly dropped. This instrument is still employed by the Inquisitions in some countries, as Iceland, Turkey, and Constantiople.

GUIMARÃES, one of the most ancient, picturesque, memorable, and beautifully situated towns of Portugal, in the province of Entre Douro e Minho, stands within an amphitheatre of hills covered with the most luxuriant foliage, between the D'Ave and the Ave, 12 miles south-east of Braga. Its narrow streets, its broad red balconies and verandas, its walls, part of which are now in the centre of the town, and are surmounted by pointed parapets, and its remains of ancient architecture...
and, on however, largely though now Coast, particularly southward «8 Cape (q.v.). As from its greatest neighbourhood the Western dried manufacture and he Ticinity structure, cathedral, Among 14th town, teen the town, more divided Negro, the celebrated as 120°, to the Great Indigo, commodity cases and most commencement, its being in former Dahomey, in it, being in it, are held appointed. the epoch of the commodity, the name of Ottawa, or the name of Angola. Cape, British Guiana, to the east, and its west, Brazil, and the south, Brazil, and the south, the waterless desert which stretches away as far as the Great Orange River, while, towards the north, it is held sometimes to comprise Sene-gambia, and sometimes to exclude it—the common boundary being very loosely observed. With its greatest length of shore-line, it extends from the neighbourhood of the Senegal to the vicinity of Cape Negro, the stream being in lat. 16° N. and long. 16° 33' W., and the headland in lat. 15° 41' S., and about long. 11° 40' E.; and by the equator, which thus intersects it, it is divided into Upper or Northern, and Lower or Southern Guinea. In its African relations, this vast region, reckoning from the coast-line, extends from the coast of Angela, Ashantee, Dahomey, Benin, Biafra, Loango, Congo, Angola, and Benguella, connecting with the Atlantic even more distant territories by means of its rivers, more especially by the Senegal, the Gambia, the Niger, the Old Calabar, the Zaire or Congo, and the Coanza. But it is in its European relations that G. is best known to the world. It was first discovered by the Portuguese in 1487, while creeping southward in quest of a passage to India, and they have retained possession of the coasts of the whole of Lower G., the chief states of which are Loango (q.v.), Congo (q.v.), Angola (q.v.), and Benguela (q.v.). The Dutch, French, and English also established various settlements, or rather factories, particularly in Upper G., the coast of which is now divided into Grain Coast, Ivory Coast, Gold Coast, and Slave Coast. In addition to the articles of traffic designated by this nomenclature, the soil yields indigo, pepper, cotton, sugar, and palm-oil. The staple commodity has been, and perhaps continues to be, human flesh; and, in fact, G., with reference to the epoch of its discovery, became, from the commencement, the involuntary partner of America. Recently, however, this nefarious pursuit has been abandoned by almost every Christian state; nay, further, though the profits of the piracy are found too largely to neutralise its perils, yet counteracting agencies of more or less efficacy are now at work on the spot. To say nothing of such systematic organisations as the British Sierra Leone (see Free Town and Sierra Leone) and the American Liberia (see Liberia and Monrovia), almost every settlement is in some degree a centre of beneficent effort on the part alike of political authorities and of religious associations. To cite as instances the Cape Coast and the Gambia—the former containing 20 Wesleyan chapels, and as many Wesleyan schools; and the latter, according to the official report of the governor, has, for its main object, 'to diffuse freely and fully, far and wide, agriculture, commerce, civilisation, religion, peace, and good-will among the surrounding tribes, countries, and nations.'

GUINEA, GULF OF, a portion of the Atlantic Ocean, washes that remarkable bend of Western Africa, which, reckoning from the north, runs first nearly on a parallel, and then nearly in a meridian. It may be regarded as stretching from Cape Palmas, in lat. 4° 22' N., and long. 7° 44' W., to Cape Lopez, about lat. 1° S., and in long. 8° 35' E. At its north-east extremity is the delta of the Niger, between the Bight of Benin on the north-west, and the Bight of Biafra on the south-east. Of its east shore, reckoning from the north, are the islands of Fernando Po, Prince, and St. Thomas.

GUINEA, a gold coin formerly current in Britain, derived its name from the fact that the gold from which the first specimens were coined was brought from the Guinea-coast in West Africa, and, for the same reason, it originally bore the impression of an elephant. It was first coined during the reign of Charles II., in 1664, and continued in common use till 1817, when it was superseded by the

Guinea of Charles II.

Sovereign (q.v.). Its value varied considerably at different periods, but was latterly fixed at twenty-one shillings. It is still customary in Great Britain to estimate professional fees, honoraria of all kinds, complimentary subscriptions, prices of pictures, &c. in guineas; to give a physician three sovereigns and three shillings, rather than three sovereigns alone, or even three sovereigns and five shillings, is supposed to make the transaction differ from a mere mercantile one, and thus veils the cordiality which is fancied to attach to pounds, shillings, and pence.

GUINEA CORN, a name sometimes given to Durra (q.v.); sometimes to another cereal grass, Pennicillaria upicata or Pennisetum typhoides, very extensively cultivated in Central Africa, and to some extent also in India, where it is called Bajre. It is of the tribe Pasicse, and may be regarded as one of the millets. It is a grass with a spike-like cylindrical panicle.

GUINEA FOWL, or PINTADO (Nymius), a genus of gallinaceous birds of the family Phasianidae, having a short, strong bill, the upper mandible vaulted, a warty membrane at the base of the bill, and a wattle hanging down on each side, the head and upper part of the neck generally naked, the forehead surmounted either with a callous or a featherly crest; the back much elevated and arched, the tail short. The species are all natives of Africa and Madagascar. The best known is the common G. P., or Pintado (N. Melanops), with naked head, and callous casque, and slate-coloured plumage, everywhere speckled with round white spots of various sizes. It is common in Guinea, and apparently through all the regions thence to the neighbourhood of the Cape of Good Hope; it is found also in more northern parts of Africa, and

189
GUINEA GRASS—GUINEA-WORM.

was known to the ancient Romans, by whom it was called *Moleagris* and *Gallina Numidica*. Its flesh was highly prized by them. In a wild state, the G. F. is generally seen in large flocks. It is not so polygamous as many of the gallinaceous birds, and even in a state of domestication, exhibits the inclination to pair. It is now common in the poultry-yards of most parts of Europe, although it is more adapted to warm than to cold climates, and in Jamaica, has been completely naturalised, so as to be destructive to crops, and to be shot like other game. In Britain, the young trouble the farmers some to rear, but the high price borne in the market by the birds and their eggs, compensates those who keep guinea fowls for profit. The eggs are small, and have a thick strong shell, but are particularly esteemed. Guinea fowls, however, are troublesome in a poultry-yard, from the disposition of the males to attack and tyrannise over other poultry. The G. F. has a peculiar harsh and querulous cry, which it emits with great frequency. There is a white variety of Guinea fowl.

GUINEA GRASS (*Panicum maximum*), a grass of the same genus with Millet (*q. v.*), a native of the west of Africa, but now naturalised, and extensively cultivated in the West Indies and southern states of America. It does not perish even in the winters of Britain, but is not luxuriant and productive, as in warmer climates. Its height, in favourable moist situations, is from 5 to 10 feet; in dry grounds, it is smaller; it has a much-branched and spreading panicle, long flat leaves, and a somewhat creeping root. In countries favourable to its growth, it is very valuable as food for cattle.

—Other species of the same genus are among the most useful pasture and forage grasses of tropical countries.

GUINEA PEPPER, a name which has been variously applied to the seeds or dried fruit of several very different plants, agreeing in their pungent character, and in being the produce of the west of Africa. The name Malaguetia (Malaghetia, Meleagquette, &c.) Pepper is generally to be regarded as equivalent with Guinea Pepper, and is at present a frequent designation of *Grains of Paradise* (*q. v.*); but the capsul-, or dry berries of *Capsicum frutescens* (see Capsicum) are commonly sold by druggists under the name Guinea Pepper; whilst both the names Guinea Pepper and Malaguetia Pepper have been applied to the dried fruit of *Cubeba Clusii* (see Cubeb), and to the seeds of *Habellia* (or *Nylophia*) *Ethiopica*, a shrub of the natural order Annonaceae. This last was at one time a considerable article of export from Guinea, and was sometimes called Ethiopian Pepper. It is now seldom even heard of. It is an aromatic and not extremely pungent condiment.—There is great difficulty in determining which of these kinds is meant in many instances in which the term Guinea Pepper or Malaguetia Pepper is employed by the older writers; yet, from the importance of the trade in this article, the name *Grain Coast* was given to a great tract of land in the Big Bend of the Senegal, and to it the establishment of the settlements of Grand Bassa and Cape Palmas is due. Up to the close of the 18th c., Guinea Pepper continued in request, when the peppers of the East drove it from the market.

GUINEA-PIG. See Cavy.

GUINEA-WORM, known also as *Filaria Medinensis*, or *F. Dracunculus*, is a parasitic animal that seems to have been known from the earliest times. It is described in his *Symposium* (*Table-talk*), quotes a passage from the geographer and philosopher Agatharchides of Cnidus, who lived in the second century before our era, which seems clearly to refer to this worm; and it has been argued with great plausibility that the "fiery serpents" which attacked the Israelites in the desert were in reality Guinea or Medina worms.

The serpents on account of the "fiery serpents" was propounded by Bartholin in his Commentary, and Küchenmeister, one of our highest authorities on parasitic animals, addsuce the following arguments in its support. The Hebrew words which in our version are translated "fiery serpents" are *Nechaachim Seraphim*; the former word is correctly translated "serpents"; while *seraphim*, derived from the word *seraph*, can signify nothing more than *is qui constrainit*; and it is dear that a species of animal is referred to which is distinguished by the inflammability of its bite, or generally by the inflammation which its presence causes. "That in ancient times the Filaria (or Guinea-worm) was regarded amongst the serpents on account of its snake-like form, is proved at once by the Greek name *drakonion* (Lat. *dracunculus*), a species of snake which had something fabulous and inexplicable about it. The inflammatory pain and swelling which occurred with the breaking out of the worm are certainly very well expressed by *seraphim*; while the mortality amongst the Israelites is easily explained by their ignorance of the treatment, and the dangerous symptoms occurring in consequence of the breaking of the worm, which, according to some authors, may be immediately fatal. Only in the last portion of the way through the desert of Sin towards Mount Hor, but especially on the way from Horeb to Beth, for which journey they required several months, did the Israelites come into the true district of the Medina-worm—namely, the central and eastern portion of Arabia Petraea. This entire march they would undoubtedly have passed over within the period of incubation of this worm (two months to one year). Here the Filaria (or Guinea-worms) first broke up, with violent inflammatory pains. Thus, then, the Israelites contracted these worms which are still indigenous in Arabia Petraea; and this worm-province may consequently

Young *Filaria Medinensis*:

A, individual coil up, as seen in the body of its parent; B, the same unraveled in a drop of water; a, the head; b, the commencement of the tail and the anus. (From Moquin-Tandon's *Medical Zoology*; the magnifying power not given.)
be of importance and interest to geographers in the determination of the course of travel in the fourteenth
year of the Israelites' wanderings. (On Parasites,
vol. i. pp. 392—393.)

Our knowledge of the natural history of this worm is very imperfect, and we are only acquainted
with it from the examination of a single specimen,
which was described by M. Robert in his "Parasites du

This worm is indigenous only in certain hot
countries, and its geographical distribution is regu-
lated by laws into which we have no insight.

Küchenmeister mentions the following places as
being especially frequent: Nubia, Gaboon, and
southern districts of the Congo. It has been intro-
duced into certain parts of America by negro slaves.

The disorder occasioned by these worms frequently
becomes an epidemic in years of heavy rain, and
especially in marshy districts. It appears also
be to be connected with the season, being especially
prevalent in the East Indies during the rainy
season, and in Upper Egypt shortly after the
regular inundation of the Nile.

The mode of production of this parasite in the
human body is not known with certainty. The
probability is, that the young animals, while still
very minute, penetrate the skin, although by what
mechanism they can effect their lodgment, we do
not know. Carter relates a case which strongly
supports this view. Fifty children in a school at
Bombay went to bathe in a pond, and 21 of
them were attacked by the Guinea-worm; some of
them having four or five worms. Moreover, it
is well known that negroes, who are in the habit
of entering the water more frequently than the
whites, and generally have their feet naked, are far
more liable to be attacked than Europeans. The
part of the body in which the worm usually mani-
est itself also accords with this view. McGregor
states that, in 172 cases, it occurred 124 times in
the feet, 33 times in the legs, 11 times in the
thighs, twice in the hands, and twice elsewhere.

Having gained an entrance into the body, the
Guinea-worm takes a considerable time to be
developed. This period varies from two months
to a year or even two years. The presence of the
worm often produces no annoyance for a consider-
able time after it has been detected; at other times,
it gives rise to emaciation, and possibly even death
from exhaustion. As a general rule, the vesicles
caused by the inflammation excited by the presence
of the worm open spontaneously in a few days,
and two or three inches of the anterior end of the
animal come forth. This end is gently pulled, and
coiled round a little roll of linen or a small stick,
and this is fastened over the wound with sticking-
plaster and a compress. The extraction is repeated
twice a day by rotating the substance round
which the worm is twisted, and the operation is
often not completed in less than two, three, or
more months. From the most ancient times, the
mention of the rearing of the worm is marked by
dangerous accident. It undoubtedly gives rise to
violent swelling, fever, and sleeplessness; and if we
are to trust the statements of some of the older
observers, shortening and deformities of the legs,
languor of the flesh, mortification, and death (some-
times even sudden death) must be reckoned amongst
the probable consequences of breaking the worm.

Although the ordinary seat of this worm is the
subcutaneous cellular tissue, it has been found in
the tongue, in the layers of the mesentery behind the
liver, and under the conjunctiva of the eye.

Small Pilaris of a different species have occasion-
ally been found in the lens of the human eye.

GUINEGATE, BATTLE of, or, more familiarly, the
Battle of the Spurs, was fought near Chalons-sur-
Meuse, not far from Tonnay, in the province of
Hainaut, Belgium, 16th August 1513, between the
English, under Henry VIII., assisted by a considerable
body of troops headed by the Emperor Maximilian,
and the French, under the Duke of Guise. The
latter were defeated. The battle received its
familiar designation from the circumstance of the
French knights having made better use of their
spurs than their lances.

GUINGAMP, a town of France, in the depart-
ment of Côtes-du-Nord, is situated in an
extensive plain, on the Trieux, in the midst of pleasing
scenery, 20 miles west-north-west of St Brieuc. It
was formerly the capital of the duchy of Penthièvre,
and was surrounded by walls, part of which still remain.
The site of the castle of the dukes of Penthièvre is
now planted with trees, and serves as a prom-
enade. G. has a college, a thread-factory, and
several tanneries. Pop. 6424.

GUIPU SCOA, the smallest, but the most densely
peopled of the Basque provinces (q. v.).

GUISCARD, Robert, Duke of Apulia and Cala-
bria, the sixth in order of seniority of the twelve
sons of Tancred de Hauteville, was born in the
year 1015. Tancred's estates in Lower Normandy
being insufficient to support such a numerous
family, his three eldest sons, William, Dagobert,
and Humphrey, determined to seek their fortunes
in the wars of Italy. By good-fortune, courage,
and wiles, William gained possession of Apulia;
and Robert, desirous of sharing his brothers' for-
tunes, followed them to Italy with a small band of
adventurers. Here he distinguished himself so
highly in various battles, that, after the death of
William and Humphrey, he was proclaimed Count of
Apulia. G. next conquered Calabria, in the pos-
session of which he was confirmed by Pope Nicholas
II., who, but a short time before, had excommun-
cated him on account of his many acts of violence.
G., from motives of gratitude, bound himself to pay
an annual tribute to the Romans; but his
superiority still claimed by the papal see over
Naples dates from this period. G. now despatched
his youngest brother Roger, at the head of 300
warriors, to conquer Sicily, the possession of which
had been promised to him. Roger, at the head
of 1000, took Messina, and in the following year
the two brothers defeated the Saracens at Enna. Roger
eventually conquered the whole island, and became

141
first Count of Sicily. Meanwhile, Robert gradually gained possession of the towns that still remained in the hands of the Saracens, among others, Salerno and Bari, and thus established what was till 1860 the kingdom of Naples. He would have carried his victorious standard in other directions, had he not been excommunicated by Gregory VII, on account of his inroad into Beneventum. Having become involved in the affairs of Greece by the marriage of his daughter Helena with Constantine Ducas, son of Michael VII, he allowed Bohemund to undertake the conquest of Corfu, while he himself hastened to Durazzo, and before the walls of that city gained a brilliant victory over the Greek emperor, Alexius Comnenus. He now marched through Epirus to Thessalonica, and had nearly reached Constantinople, when he received information that the Emperor Henry IV, had made an inroad into Italy. He immediately hastened back, after intrusting the chief command to Bohemond, compelled Henry to retreat, and liberated the pope, who was besieged in the castle of St Angelo. He then returned to Epirus, defeated the Greeks in several engagements, took possession of some islands, and returned to Italy. After advancing a second time to Constantinople, when he died at Cephalonia, 17th July 1085. His remains were buried at Venosa; his sons Bohemond and Roger inherited his possessions: the former received Tarento; the latter, Apulia. Guiscard was not only a hero and a conqueror, but a patron of the arts and sciences.—Compare Guittier d'Arc, Histoire des Conquêtes des Normands en Italie, en Sicile, et en Grèce (Paris, 1839).

1151, the name of a branch of the ducal family of Lorraine, distinguished in the history of France and Europe during two centuries. It derives its name from the little town of Guise, in the department of Aisne (situated on the Oise). The following are its most remarkable members:

CLAUDE OF LORRAINE, first Duke of Guise, Peer of France, Grand Huntsman, Count d'Amale, Marquis of Mayenne and Elbeuf, Baron of Joinville, &c., was the fifth son of René I., Duke of Lorraine, and Marguerite de Bourbon, and was born at Moncontour, October 1, 1496. He left Lorraine on account of a quarrel with his elder brother, accompanied Francis I. to Italy, and received twenty-two wounds at the battle of Marignan, 1515. Eight years later, he drove the Emperor Charles V. from Flanders, in 1523. In 1542 he fought under the Duke of Orleans. He was favoured by the king, for his valour and talent. He married Antoinette of Bourbon, by whom he had twelve children, of whom eight were sons. His daughter Mary was the wife of James V. of Scotland, and mother of Mary, Queen of Scots. He is reported to have died of poison, April 1550.

FRANCOIS OF LORRAINE, second Duke of G., son of the preceding, was born February 17, 1519. As a general, he acquired European renown. He distinguished himself at Montmedy (1542), Landrecies (1543), St. Dizier (1544), Boulogne (1548), and attracted the attention of France by his defence of Noyon. After two months in Flanders, V., was driven out after firing 11,000 balls, and losing 30,000 men, was obliged to raise the siege (1553). He added to his reputation at Reutti (1554), and in 1556 took command of the expedition against Naples. This expedition did not succeed, the king having been made lieutenant-general of France, retrieved his reputation by taking Calais, Guines, and Ham, which were in possession of the English, and were considered impregnable. His military successes were ended by the peace of 1559. His niece, Mary Stuart, being the wife of Francis II., he became the highest power in the state, and the head of the Catholic party. The death of the king and a strong party against him, drove him from the court, but he was soon recalled, to take the command against the Huguenots, who had taken several important towns, and were committing great ravages. He defeated them, and entered into negotiations for peace. The Maréchal St Andre was killed, the Prince of Condé and the Constable taken prisoners. G., the greatest of his name, was assassinated before Orleans, February 24, 1563. He had a taste for literature, and his writings, written by himself, have much historic interest.

HENRI I. OF LORRAINE, third Duke of G., was born December 31, 1550. The death of his father placed him at the head of the Catholic party. Ambition and revenge both Jim promised him action. At the age of 16, he distinguished himself in fighting against the Turks in Hungary. Three years later, he fought with the Huguenots at Jarnac (March 1569) and Moncontour (October 1569), and in the same year forced Condé to raise the siege of Poitiers. He aspired to the hand of Marguerite of Valois, but, to appease the anger of the king, married Catherine of Clèves, 1570. Disgusted with his wife, he married the favourite of the king; he retired, but returned, and was engaged in the massacre of St Bartholomew, August 24, 1572, in which he saw the dead body of Coligny thrown from a window into the courtyard at his feet. In 1573, fighting with the Huguenots, he was wounded in the face, whence he received the name of Balafré (scarred), a designation borne also by his father from a similar circumstance. He formed the famous League—ostensibly for the defence of the church, really to raise himself to the throne of Charlemagne. The king coquetted with both parties. G. conquered Henri of Navarre, but the king refused him entrance to Paris. The people rose in his favour, and he might have been king, but he negotiated, and promised all the powers which he demanded, but the king caused him to be massacred in the palace, and is said to have kicked his lifeless body. His brother the cardinal was also killed. Their bodies were burned, and the ashes scattered to the winds, December 23, 1558.

HENRI II. OF LORRAINE, fifth Duke of G., was born April 4, 1614. He was destined for the church, and at the age of twelve possessed twelve monasteries or abbeys; at fifteen, he was Archbishop of Reims, but on the death of his elder brother he quitted a calling he detested, and succeeded to the dukedom. Handsome, chivalric, brave, he was a true specimen of the ancient paladin, and celebrated for his numerous gallantries. Loved by Anne de Gonzague, princess of Mantua, he capriciously abandoned her, joined the party of the Comte de Soissons, and married the widow of the Comte de Bossut. Having joined the league against Richelieu, he was condemned by the parliament of Paris to capital punishment, but took refuge in Germany. On the death of Louis XIII., he returned to France, disguised with his wife, whose fortune he had spent, and proposed to marry Madeleine de Pons, one of the queen's maids of honour. He fought in the campaigns of 1644 and 1645 as a volunteer, and then repaired to Rome to get a divorce, which he obtained. Hearing that the French were again at war against Spain, under Massanetello, he set off for that city, in the true spirit of knight errantry, to conquer a kingdom with his sword for the princess he still hoped to gain. Passing in for a felucca through the Spanish troops, G. entered Naples in December 1647 and was received with the utmost enthusiasm; but his gallantries, the envy of the nobles, and jealousy of France, caused
him to be betrayed, in April 1849, to the Spaniards, and he was carried a prisoner to Spain. Demanded by Condé, he was set at liberty in 1852, and joined, with Condé, the enemies of the court and of Mazarin at Bordeaux. Two months later, he had betrayed his allies, and was at Paris with the king, but misfortune still followed him, and he found that his mistress, for whom he had endured so much, was false, and that with his own esquire. Finding himself an object of ridicule at Paris, he attempted to return to Naples, but was caught; returned to Paris, was made grand chamberlain, there directed the magnificent fêtes of Louis XIV., and died without children in 1664.

**GUITA R.** A musical stringed instrument, somewhat like the lute, particularly well adapted for accompanying the human voice, and much esteemed in Spain and Italy. It has six strings, tuned as follows:

```
\[ \text{F} - \text{E} - \text{D} - \text{B} - \text{G} - \text{E} \]
```

and the sound is produced by the fingers of the right hand twitching the strings, while the fingers of the left hand make the notes of the music on the finger-board, which has frets across it like the lyre. The three highest strings of the guitar are always of gut, and the three lowest are of silk spun over with silvered wire. The greatest virtuosi on the guitar were Giuliani, Sor, Zocchi, Stoll, and Hertatsky.

**GUIZOT, FRANÇOIS PIERRE GUILLAUME,** a French statesman and historian, was born at Nîmes, October 4, 1787. His parents were Protestants; his father, who was an advocate, perished on the scaffold, April 8, 1794, and his mother soon afterwards went, with her two sons, to Geneva, where G. received his education. In 1805, he went to Paris, and devoted himself to literature. His first work, the *Nouveau Dictionnaire Universel des Synonymes de la Langue Française* (2 vols.; 4th ed. Paris 1848), appeared in 1809; the introduction reveals a very methodical mind. The next seven years were spent in laborious literary activity. After the second Restoration, he became general secretary to the Ministry of the Interior, afterwards to the Ministry of Justice. On the retirement of Barbe-Marbois, G. tendered his resignation, and was first appointed *maitre des requêtes*, afterwards councillor of state. G. contributed to the dissolution of the *Chambre Introuvable*, by writing a memorial which was placed in the hands of Louis XVIII. by Decazes. The latter committed to him the general direction of the administration of the commonwealths and départements (1819). His writings from 1820 to 1822 are entitled *Du Gouvernement de la France depuis la Restauration et du Ministère Actuel* (1821); *Histoire des Origines du Gouvernement Royal*. Containing his lectures at the Sorbonne (where he held the position of lecturer on history) of 1820—1822 (new ed. 1852). Government forbade his lectures in 1824, and, G. again betook himself to literature. In conjunction with several other men of letters, he published the important *Collection des Mémoires relatifs à l’Histoire de France, depuis la Fondation de la Monarchie jusqu’au 13ème Siècle* (31 vols., Paris 1825—1833); and the *Collection des Mémoires relatifs à l’Histoire de la Révolution d’Angleterre* (26 vols., Paris 1823). He likewise edited several works of other authors, with introductions, annotations, and additions, such as Letourneur’s translation of Shakspeare (12 vols., Paris 1821), Hallam’s *History of England*, and Mably’s *Observations sur l’Histoire de France*, followed by the *Essais sur l’Histoire de France*. In addition to all these, he published his *Histoire de la Révolution d’Angleterre* (2 vols., Paris 1827); and the *Revue Française*. In the following year, the Martignac ministry granted him permission to resume his course of lectures on history. These were attended by a large and enthusiastic audience, and rise to several historical works of great value, published under the collective title of *Cours d’Histoire Moderne* (1828—1830); among others, the *Histoire de la Civilisation française depuis la Révolution de l’Empire Romain jusqu’à la Révolution Française* (5 vols., Paris, 1829—1830; 5th ed. 1845), and the *Histoire Générale de la Civilisation en Europe*, &c., which serves as an introduction to the former work. On the 1st March 1826 he again took his place in the council of state, and in January 1830 was elected by the town of Lisieux, which he continued to represent in the chamber.

After the July revolution, G. became successively Minister of Public Instruction and Minister of the Interior, an office which he held, with two interruptions, till 1836. In this capacity he did much for the improvement of educational institutions, particularly the middle schools. On the issue of the dorsal of the Eastern disturbances in the beginning of the year 1840, under Soult’s administration, G. was sent as ambassador to London. After Soult’s retirement, in September 1847, he became the official leader of the cabinet, which maintained its ground, as the organ of Louis Philippe’s policy, till the February revolution of 1848, and by its conduct both in home and foreign affairs, did much to bring constitutional government into disrepute, and to hasten the overthrow of the Orleans monarchy. As a statesman, G. in carrying out his systematic and repressive line of policy, proved himself stiff, one-sided, and latterly obdurate; from these qualities, as well as from his cold and disagreeable manner, he has always been unpopular to the last degree with the nation. As a man of rectitude and austere morals, he never enriched himself at the public cost; but nevertheless, from political motives, he allowed others to do so during his administration, in the most flagrant manner. After having effected his escape from Paris, he retired to London, where he was received with great respect. In April 1849, he published a circular *Guizot à ses amis*, in which he offered his services to the electors of France, but ineffectually. In the following November, he returned to Paris, where he continued to labour in conjunction with the heads of the monarchical
parties. After a short visit to Louis Philippe in England in June 1850, he came forward in Paris as the main promoter of the fusion, and wrote likewise in the Assemblee Nationale. The coup d'état of 2 December put an end to this career; and G. returned to England. His services in the cause of literature and science are acknowledged by all parties. By founding the Comités Historiques, by bringing about the publication of important historical documents, and by his own writings and lectures, he has done much to extend a taste for historical studies in France. In 1837 he was intrusted with the government of the United States with the task of writing a history of Washington. His work, published under the title Vie, Correspondance, et Écrits de Washington (2 vols., Paris 1839—1840), procured him the honour of having his portrait placed in the Chamber of Representatives at Washington. Since the February revolution, G. has published several political treatises, more or less important, some of which at least are very interesting to Englishmen, such as Révolution d'Angleterre, and Monk, Chute de la Monarchie. He has likewise written Méditations et Études Morales sur la Religion, la Philosophie, &c. (1852); Corrélle et son Temps (1852); Shakespeare et son Temps (1892). Recently (1858) appeared a work of great political interest and value, entitled Les temps pour servir de base à l'Histoire de mon Temps. His latest publication is a strange one for a Protestant, viz., a defence of the temporal power of the pope (1861). G. has been twice married; both his wives (the first of whom died in 1827, and the second in 1833) were accomplished women, and not unknown in literature.—His son, Maurice Guillaume, has shown by his Ménandre, Etude Historique sur la Comédie et la Société Grecques (1855), that he is not destitute of his father's genius.

GUIZOTIA. See RAM-TIL.

GIJERA'T, or GUZERAT, a walled town of the Punjab, in lat. 32° 38' N. and long. 74° E., stands on the right side of the Chenab, about 8 miles from the stream. It is a place of some military and political importance, being on the great route between Attok and Lahore. Here, on 21st February 1849, a Sikh army of 60,000 men was utterly defeated by a British force, decidedly inferior in number of numbers.

GULDEN. See FLORIN.

GULES (Fr. guenval, the mouth and throat, hence red. Other origins are given, such as the Persian ghul, a rose or rose colour, which seems more probable than the Hebrew galude, a piece of red cloth, from which MacKenzie derives it; it being scarcely likely that it came from a Semitic source), the term by which the colour red is known in heraldry. In engraving, it is marked by perpendicular lines traced from the top of the shield to the bottom. See Heraldry. It is supposed to indicate valour, magnanimity, and the like, and is regarded as the most honourable heraldic colour.

GULF STREAM AND OCEAN-CURRENTS.

The most important and best known of the great ocean-currents derives its name from the Gulf of Mexico, of which it flows, being seen by a Florida on the one side, and Cuba and the Bahamas Islands and shools on the other. With a breadth of about 50 miles in its narrowest portion, it has a velocity of nearly five miles an hour, and the descending currents produce an immense torrent. This great ocean-river flows in a north-easterly direction along the American coast, gradually widening its current and diminishing in velocity, until it reaches the island and Banks of Newfoundland, when it sweeps across the Atlantic, and divides into two portions, one of which turns eastward toward the Azores and coast of Morocco, while the other laves the shores of the British Islands and Norway, and can be perceived on the southern border of Iceland and Spitzbergen.

The waters of the Gulf Stream are of a deep indigo blue, with boundaries sharply defined against the light green of the seas through which it passes in its early course. It abounds with masses of sea-water, torn from the coral reefs of the strait through which it passes when it has its greatest power and velocity; while in its warm current may be seen myriads of fish and of animalcule. As this great stream pours out of the Gulf of Mexico, it has a warth of 86° F., which is several degrees higher than that of the ocean at the equator. This heat it so far retains that it only falls to 75° off the coast of Labrador; while the British Islands and north-western coasts of Europe, at a distance of 4000 miles from the Gulf, are bathed with waters heated under a tropical sun. In mid-winter, off the inclement coasts of America, between Cape Hatteras and Newfoundland, ships beaten back from the ports of England and France, are sometimes loaded down with ice and in danger of foundering, turn their prows to the east, and seek relief and comfort in the Gulf Stream. A bank of fog rising like a wall, caused by the condensation of warm moist atmosphere, next the ground, seizes the edge of the stream. The colour of the water suddenly changes from green to blue, the climate from winter to summer; and this change is so sudden, that a ship crossing the line, two thermometers, dropped at the same instant from her bow and stern, will shew a difference of 30° of temperature.

The great differences of temperature between the western shores of Europe and the eastern shores of America have been attributed, too largely, perhaps, to the influence of the Gulf Stream. There is no doubt that such an immense body of heated water in the north-eastern Atlantic must raise the temperature of the atmosphere, and thereby produce a condensation of tropical sunshine by sea is due, to a certain extent, Ireland's perpetual green, the soft moist climate of England and Scotland, and the fact that the harbours of the western coast of Norway up to 70° of latitude are open, and it only much farther north, is a sheet of ice. England, clothed in perennial verdure, and Scotland, where the grass grows during eleven months of the year, are in the same latitude as the freezing and bare coast of Labrador. Norwegian in opposite Greenland; and Lisbon, where frost is scarcely known, is in the same latitude as Washington, where the Potomac river, a mile in breadth, sometimes freezes over in a single night. But the whole of this difference is not to be ascribed to the Gulf Stream. The Great Sahara is like an immense furnace, from which hot winds sweep over Europe. All Africa warms our southern breezes. The Mediterranean, exposed to no cold currents from the Arctic regions, bearing bergs and fields of ice, is a constant receiver and distributor of heat, and modifies the temperature of adjacent regions. North America, on the contrary, is exposed along its eastern coast to the current known as the Polar Sea, running inside and counter to the Gulf Stream, and coming loaded with ice from the northern regions; and while the continent narrows, it grows colder; the sea, on the other hand, gets warmer, and the cold north-westers, the prevailing winds during the wintry season.

The effect of the Gulf Stream upon temperature has been nowhere more strikingly observed than in
high northern latitudes. When the northern branch which flows toward Iceland meets the arctic current, it raises the temperature of the atmosphere 17 °F. When the thermometer stands at 32° in the arctic current, it rises to 49° in passing into this branch of the Gulf Stream. Iceland is exposed to the arctic current on its northern and eastern shores, and is washed by the Gulf Stream on its southern and western. While the thermometer stands at 35° in the western aspect of Iceland, it rises to 50° or 51° on the south-western, making a difference of 18°. Similar, though less striking, differences are observed in the temperature of the eastern and western coasts of Scotland.

In treating of the cause or causes of the Gulf Stream, we must take a general view of ocean-currents. Respecting the causes of these, there have been many fanciful speculations. Some attribute them to the motion of the earth, but we can find no force connected with the rotation of the earth on its axis to move a great body of water from its equatorium. The solid and fluid portions of the planet move together with the same momentum, and it is the cause in the Ison Sea, that the Gulf Stream, produced by centrifugal force, that force being uniform in its action, there is no reason for their return toward the polar regions. It cannot be said that the internal heat of the earth, or hidden volcanoes, act as a cause in the arctic regions. A portion of the ocean, the water is found to be of uniform temperature, and there is little reason to believe that important currents are produced by the rising of hot springs to the surface of the earth.

All the parts of the Gulf Stream and of all ocean-currents may be accounted for by two principal causes—viz., the action of winds and evaporation. The currents of the Red Sea and the Mediterra-
nean may be accounted for by evaporation. More water passes into vapour than is supplied by all the great rivers of Europe and Africa emptying into the latter sea. This waste is supplied by a strong current from the Atlantic through the Strait of Gibraltar. But the evaporation of so much sea-water must leave the remainder heavy with saline matter in solution, and this water, of a high specific gravity, is supposed to form an under-current which pours outward through the same strait into the Atlantic. Similar causes in the Ison Sea produce similar effects. Evaporation in the tropical regions of the great oceans must also produce compensating currents from the temperate and polar seas, by means of which icebergs float into warm latitudes, and are melted by the sun's rays. This is abundantly the case, and that by this means alone a circulation is established. The arctic and antarctic currents are in this manner partly accounted for; but the tropical currents, and those which flow from warm to colder regions, and distribute tropic heats to high temperate and polar regions, require another agency.

The great cause of such ocean-currents and of the Gulf Stream is believed to be the winds perpetually blowing from east to west over the tropical seas. The effect of strong winds in driving the waters before them and heaping them up, is familiar to all who have watched gales of several days' duration on our sea-coasts. Such a gale from the north-west has driven the German Ocean, and in such a case strong currents would be found setting into the Baltic and through the Strait of Dover. But we have on a smaller scale a more striking example. Lake Erie, one of the great chain of lakes in North America, whose outlet is the river St Lawrence, is about 280 miles in length, and about 60 in width in its widest part, tapering toward either end, and shaped like a weaver's shuttle. This lake is subject to south-western gales, blowing in the direction of its longest diameter, and lasting several days. On these occasions, the waters become heaped up at the north-eastern end of the lake, and sometimes rise several feet in the harbour of Buffalo and the Niagara river, while the vessels at Toledo, at the other extremity of the lake, are left lying in the mud, from the water having run out of the harbour. We have, then, only to look at the configuration of the western aspects of the Atlantic Ocean, to account for the production of the Gulf Stream and its whole system of currents. We may even find its source in the Indian Ocean. The trade-winds of that ocean produce a gradually increasing current of its waters, which strike the African coast north of Madagascar. The current divides, and encloses that island, and passing southward, rushes around the southern cape of Africa, taking the name of the Agulhas Current, from the cape of that name, and passing into the Atlantic Ocean. At this point, it has at certain periods of the monsoons a velocity nearly as great as that of the Gulf Stream at the Bahama. This current, pressed northerward by the great antarctic polar current, of which the eastern coast, is turned westward by the form of the continent, and is lost in the great equatorial current produced by the Atlantic trade-winds.

This equatorial current sweeps across the ocean until it reaches the Antarctic current, and divides on the eastern cape of Brazil, in 5° S. lat. The greater portion bends to the north, carrying with it along the coast, north-westernly, the great currents of the Amazon and Orinoco. This current then passes through the Caribbean stream, and the Gulf of Mexico. These waters, warm from the African coasts and equatorial regions, are heated up in the great circular basin, fifteen hundred miles in diameter, into which no northern counter-current can penetrate, and are here further heated, until they rush out through their only outlet, the Strait of Florida, with a force which carries them to the shores of Norway and the Azores, while counter-currents, carrying down icebergs, are gliding from the polar seas toward the equator.

The Pacific Ocean has also its great equatorial or trade-wind current, but there is no great basin like the Gulf of Mexico to gather the waters of another Gulf Stream. A portion of the equatorial current passes northward along the shores of China and Japan; a portion passes through the narrow channels of the Indian seas, but more turns southward toward Australia and New Zealand, affecting, with its influences, the isotherms, and in the southern seas, a portion again passes southward, returning in counter-currents to Cape Horn, and even passing around it into the Atlantic. While thus a portion of the great counter or polar current of the South Pacific sweeps around Cape Horn, another portion passes up the western coast of South America as far as the equator; and its coolness is sensibly felt, and was carefully observed by Baron Humboldt on the coast of Peru. The currents in the waters between the Pacific and Indian Oceans are also variously affected by the monsoons, and in some places run six months in one direction, and six months in the opposite, clearly proving that they are mainly dependent upon the winds. With the most accurate knowledge of these winds, a chart of ocean-currents could almost be constructed by a calculation of their force, connected with the configuration of the coast, and the position of the land. The subject is one of such great practical interest that we may hope for perfect charts in a few years from multiplied and accurate observations.

At first sight, it appears incredible that a current of water should force its way through
the ocean with sharply defined boundaries, and a peculiar colour, temperature, and inhabitants, like a great river flowing between its banks, for thousands of miles, and against the force of counter-currents, which even cross its course, passing under by their superior density, until it loses its momentum on the shores of distant continents, or spreads out its warm flood on the bosom of northern seas. But a careful observation will satisfy us that all this is in accordance with the laws of hydrostatics. At the confluence of the clear waters of the Mississippi with the turbid current of the Missouri, the two rivers do not at once unite, but run side by side with a sharply defined boundary between them for many a league. So great rivers running into the ocean, are rivers still, far out at sea. The current of the Rio de la Plata, which drains the southern portion of South America, can be perceived 200 miles from land; and the Amazon sweeps far into the Atlantic, though gradually bent northwardly by the great trade-wind current, and then carried along the coast, to help, with the Orinoco, to swell the waters of the Gulf of Mexico; so that the waters of the Amazon, the Orinoco, the Rio Grande, and the Mississippi, all join to swell the Gulf Stream; and their waters flow with this great ocean-river to the shores of Europe, and enter, it may be, the Mediterranean Sea.

The channel of the Gulf Stream in its narrower portion is of great depth. The probability of its having hollowed out for itself a well-defined channel like the bed of a river, is shewn by a sudden increase of depth at its border, where deep-sea soundings have been made; but so little can be known of the effect of currents upon a line of 20,000 feet in length, and which requires several hours to run off the reel, that we cannot place implicit reliance on such observations.

More important observations on the courses and influence of these currents have been lately undertaken by dropping bottles containing the date, latitude, and longitude, in all parts of the ocean. These bottles, when found upon a coast thousands of miles distant, give some indication of the direction and velocity of the currents that have brought them; but such testimony is not infallible. The bottle may be impeded by contrary winds, blown into counter-currents, or whirled about for months in eddies. A bottle thrown overboard in the Indian Ocean might reach the island of Spitzbergen, or the Gulf of Mexico; but there are many chances that it would be thrown out of the regular current, and be picked up on the shores of New Zealand or the coast of Peru. See Dr Franklin's Maritime Observations, Pownall's Hydraulic and Nautical Observations, Humboldt's Atlas Geographique et Physique, Johnston's Physical Atlas, and Maury's Physical Geography of the Seas, and Wind and Current Charts.

GULFWEED (Sargassum), a genus of sea-weeds (Algae) of the sub-order Fucaceae, of which two species (S. vulgare and S. boceiferum) are found floating in immense quantities in some parts of the Atlantic, Pacific, and Indian Oceans. They are tropical plants, although sometimes carried by winds and currents to the British coasts. The frond is very long, and is furnished with distinct, stalked, nerveless leaves, and simple axillary stalked air-vessels. The receptacles are linear, in small axillary clusters or racemes. The trivial name boceiferum applied to one of the species, is derived from the berry-like appearance of the air-vessels. The G. has only been found floating, but there is reason to think that it is at first attached to the bottom of comparatively shallow parts of the sea. It floats in large fields, or more frequently in long yellow

lines in the direction of the wind. In crossing the Atlantic, its presence is regarded as a sure indication of the Gulf Stream, by which it is wafted northward and eastward. Where the Gulf Stream is deflected from the banks of Newfoundland eastward, and sends off its more southern branch towards the Azores, is situated the Sargasso Sea, that great bank of weeds, which so vivaciously occupied the imagination of Christopher Columbus, and which Oviedo calls the sea-weed meadows' (Humboldt). The quantity of floating sea-weed is often such as to impede the progress of ships. Multitudes of small marine animals accompany it, with fishes ready to prey on them. The G. is eaten in China; and in other parts of the East also, it is used in salads and as a pickle.

GULIFELMA, a genus of South American palms, with pinnate leaves (entire in young plants), natives of the lower mountain-ranges of Peru and New Granada. One species, G. speciosa, is much planted by the Indians of the Amazon district and of Guiana and Venezuela, near their villages, and supplies them with food and other necessaries. It is often 60 feet high, having an erect slender stem, encircled with many rings of needle-like spines, and numerous drooping leaves forming a nearly spherical crown. It is variously called Pampuna, Paripou, &c., and sometimes Peach Palm.

GULL (Larus), a genus of web-footed birds, of the family Laridae (b.), inhabitants of the sea-coasts of all parts of the world. The formation of the head and bill of several species is given in the accompanying illustration. The feet have three toes in front completely united by a web, and a small hind-toe not included in the web, and sometimes altogether wanting. The wings are long and pointed. Gulls have great power of wing, and fly apparently with ease against a storm, during the continuance of which they generally fly low, whether over sea or land, but in fine weather soar higher in the air, in which they seem to delight in

GULFWEED—GULL.
performing the most varied and beautiful evolutions. They descend with great rapidity to seize prey from the surface of the water or at a small depth; but they are not good divers, and the fishes which they catch are chiefly those which, like the

herring and others of the same family, swim near the surface. They are very voracious. Their food consists of almost anything animal. Many of them are wholly or partially migratory, breeding in colder regions than those which they inhabit in winter. In general, they lay only two or three eggs, which are large for the size of the bird.

Many of the gulls are frequent visitors of inland districts, ascending rivers, and hovering over them is quest of prey as over the sea. Some of them are also often to be seen in meadows and ploughed fields, seeking for worms and other such food. It is a common notion in Britain that the appearance of gulls in inland districts betokens stormy weather. But in America, the migrations of some of the species between the northern seas and the Gulf of Mexico are performed, not only along the Atlantic coast, but by the great lakes and the valleys of the Ohio and the Mississippi, and a few occasionally remain and breed near these inland waters. Large flocks of a species of gull (L. serranus) frequent the lakes of the high table-lands of Peru.

Some at least of the larger gulls break the shells of molluscs by taking them up to a sufficient height in the air, and dropping them on a rock. This interesting fact is attested by Audubon, the American ornithologist, as having come under his own observation, and he mentions an instance in which a gull, finding the shell not broken by the fall, carried it up a second and a third time, and each time higher than the former.

The flesh of gulls is rather coarse, but that of the young is in demand on many northern coasts as an article of food, and is salted for winter use. The eggs of certain species, such as the Black-headed Gull, are said to be very palatable, and are collected in great quantities in some places where these birds breed in large numbers.

The plumage of gulls is generally in great part white, variously mixed with gray, slate-colour, brown, and black. The white, in some species, assumes a rosy tint in the breeding season; and the head of some becomes black. The differences of plumage, according to age and season and sex, are very considerable, and have led to many errors as to species.

One of the most common British species is the Black-headed Gull (L. ridibundus), the whole length of which is about 16 inches; another is the Common Gull or Sea-mew (L. canus), mostly of a gray colour above, and white below, fully 18 inches long; the Herring Gull (L. argentatus), a still larger species, is common on rocky coasts; the Kittiwake (L. tridactylus or L. rises), rather smaller than the first-named species, gray and white, destitute of hind-toe, is plentiful where the coast is girt with rocky precipices, on the narrow ledges of which it makes its nest; its young and eggs are among the chief objects of pursuit of the rock-fowlers; the Lesser Black-backed Gull (L. fuscus), about 23 inches long, is pretty common, at least in the north; the Great Black-backed Gull or Woel (L. marinus), nearly 30 inches long, is not rare; and the Glaucoous Gull or Burgrimaster (L. glaucus), scarcely inferior to it in size, though by some supposed to be identical with the Great Black-backed species, of a pale bluish-gray colour above, and white below, is a winter visitant from the arctic regions. This species seems to have acquired its name of Burgrimaster from the superiority which, in virtue of its size and strength, it asserts over most of the smaller birds of the northern seas, compelling them to relinquish prey at its approach. Some of the British species of gull are also found in North America, as the Herring Gull, the Great Black-backed Gull, and the Kittiwake; but the Common American Gull (L. sonorhynchus) is not found on the eastern shores of the Atlantic.

GULLET. See GEESEPHAGUS.

GUM, a general term applied to certain exudations from trees and plants, which are very different in their chemical characters and their general properties. 3. In its strictest sense, gum is a substance which dissolves in water, forming a transparent mucilage; it is insoluble in ether, alcohol, and oils, either fixed or volatile, and is convertible into oxalic acid by the action of sulphuric acid.

The gums belonging to this class are:

1. Gum Arabic, which is gathered from the stems of Acacia Arabica and Acacia vera, two leguminous trees found in Northern Africa, and in some parts of Asia. It varies in colour from a light straw to a garnet red, and is more or less transparent; the lightest is always the best. It is imported from Barbary and Turkey.

2. Barbary Gum, a dark-coloured variety, also imported from the Marocoo coast. It has some qualities which render it particularly valuable to confectioners, in the manufacture of lozenges, &c. It is the produce of another species of acacia, A. gummosifera.

3. Gum Gelda, an inferior quality of Barbary gum.

4. Gum Senegal is in fine large, round tears, generally larger than the finest Gum Arabic; it is, however, darker in colour, being a sherry brown, and sometimes a slight pinkish tint perceptible on the surface of the tears. It is found generally in the tropical parts of the western coast of Africa, and is yielded by two species of acacia, viz., A. Senegal and A. Segal. It is much valued for dressing various kinds of fabrics, and silks, and is also used by confectioners for the finest kinds of lozenges, &c. The Acacia Arabica is also found in the East Indies, and is supposed to yield, with other species, the following gums known in commerce.
GUMBINNEN—GUM-BOIL.

5. Gum Gattie, which is imported very largely, and is produced in the Deccan, Concan, and in Gujerat.
6. Gum Babool, an inferior gum, imported from Bengal.
7. East Indian Gum, a tolerably good variety, imported from Bombay.
8. Gum Oonawatte, an inferior variety, from the province of Oonawatte.

The Indian gums are all dark coloured, and are much inferior to those produced in Africa; they are, however, extensively imported into the ports of London and Liverpool; over 200 tons are annually received into these ports.

The gums above described principally consist of a material which chemists have called Arabia, from its being the chief constituent of Gum Arabic. We now come to another class of gums, in which another material, called Bassoria, from its being first noticed in an analysis of Gum Bassora, is more or less present. These are:

1. Gum Tragacanth, or Dragon, yielded by the leguminous shrub Astragalus tragacanthus; it was known to the ancients. Conyza under the name of tragacantha. The finest pieces are in flakes, from an inch to an inch and a half in length, and from half an inch to an inch in width. This gum is more or less white, and nearly opaque, that which is whitest and most opaque being the best. It is only partly soluble in water, forming a white paste, instead of a transparent solution; with vinegar or dilute acetic acid, it also forms a similar paste, and is a valuable dressing, possessing light materials with great tenacity. It is used as a stiffening material for various textile fabrics, and is much valued for this purpose, where it is not desired to give gloss to the material. We receive it chiefly from Smyrna and Constantinople. It is mostly produced in Northern Persia and Asia Minor.

2. Gum Katere, yielded by Sterculia urens on the Coromandel coast. It is now only an occasional import, though formerly a considerable quantity was brought to this country.

3. Gum Bassora.—This is imported from Basora; hence its name; but although long known in commerce, it has not been satisfactorily determined what plant produces it. Only a very small quantity of this country from this plant, and is produced by Sterculia tragacanthus.

Besides the true gums, there are the Gum-resins, which are much more mixed in their chemical constituents; in general terms, however, they may be said to consist of certain resins soluble in alcohol, and of the true gum, so that it requires both water and alcohol to dissolve them entirely. They are chiefly used in medicine and perfumery, and may be said to form a connecting-link between the true gums and the true resins, commercially speaking. The principal are:

1. Gum Asafetida. See AsaFetida. 2. Gum Benzoin or Benjamin. See BENZOIN. 3. Gum Stryx or Starx is another sweet-scented gum-resin, produced by Strelitz officinalis in Turkey in Asia. It is usually found in a solid mass, and is black or blackish in colour. It is used in perfumery. 4. Gum Nagyvenum, another medicinal gum with unpleasant garlic-like odour, dark-brown colour, and a soft consistency. It is not known what plant produces it, but it is generally supposed to be obtained from a Ferula. 5. Gum Galbanum. See Galbanum. 6. Gum Opopanax is yielded by the roots of another umbrelliferous plant, Opopanax chenopodiaceum. It comes from the Levant in reddish-yellow lumps of a disagreeable smell. Its only use is in medicine, chiefly for plasters. 7. Gum Ammoniacum. See AMMONIUM. 8. Gum Myrrh is a very sweet-smelling gum resin, which exudes from the stumps of an Alyssum shrub, the Balanodendron myrrha. Two distinct kinds are known in commerce, the Turkish and the East Indian; the former is the better. They are both in irregular-shaped small lumps, rarely exceeding the size of a walnut, and are lighter in the Turkish sort. Considerable quantities are used in medicine, and in perfumery for dentifrices, washes for the teeth, &c., in consequence of its being supposed to possess considerable antiseptic properties, and for the agreeable odour it imparts to the breath. From 15 to 20 tons are imported annually. 9. Gum Scammony.—This is obtained from incisions made purposely in the crown of the great tap-root of the Convolvulus scammonia, which is bored for the purpose. It is of a dark sap-green colour, inclining to greenish-gray, in large and small cakes, and in irregular fragments. Its use is extensive as a mild and safe purgative for children, but scarcely any drug has been more extensively used than the oil, owing to the excessive adulteration practised upon it by the Turks previous to its shipment. This has now been obviated by importing the root itself, and extracting the gum in this country. There are many other gums, but these are the ones to be had in shops, and for which uses are found in the arts, manufactures, and in medicine. Many also of the true resins, as copal animal, &c., are called gums, but they are strictly resins. See RESINS.

Gum-substitutes are manufactured from wheat-starch, farina or potato-starch, sago-flour, and other cereals, by baking or roasting, so as to convert the starch into the true (q.v.) or important manufacture, in which a large amount of capital is engaged. They are made on a very extensive scale by the Messrs. Laing of Manchester and others, and are largely employed in dressing calicoes and other fabrics, also as a substitute for the more expensive gums in gumming paper, as in the case of postage and receipt stamps, which are made adhesive by dextrin. For this and some other purposes, the gum substitutes are superior to the real gums, as they are easily dissolved, and can be spread around equally over a smooth surface. Very large quantities of the starch of potatoes, called farina or potato-flour, are made in this country, and are also imported from the continent to be used in this manufacture.

GUMBUnnen, a thriving town of Prussia, in the province of East Prussia, is situated on both banks of the Pissa, one of the affluents of the Pregel, 68 miles east-south-east of Königsberg. It was first regularly laid out in 1724, and owes its rise and prosperity in great measure to the settlement here of many Protestants, chiefly from Salzburg, who were driven from their homes by religious persecution. Among other institutions, the town has a gymnasion with 11 professors and 237 pupils (in 1850), and two hospitals. Woolen-cloth weaving, brewing, and distilling, are the branches of manufacture. Pop. 7433.
good practice to give vent to it by a pretty free incision.

GUM TREE. See Eucalyptus and Tufelo.

GUMMEL, a town of Africa, in the state of Bornu, in lat. 12° 38’ N., and long. 9° 21’ E. In 1851, on the occasion of Dr. Barth’s first visit to G., he found it a flourishing town, the great entrepôt for the natron-trade, with a weekly market, at which were 300 stalls, offering for sale all sorts of clothing, tools, pottery, victuals, cattle, horses, &c., and with a pop. of 10,000; but in 1854, on visiting it on his return-journey, he found that, during the interval, it had suffered severely from civil wars, and was then in a state of at least temporary decay.

GUMMING, a disease analogous to Canker (q. v.), and like it, very destructive to fruit-trees, but confined to those of the sap which readily produces much gum: as the cherry, plum, peach, apricot, and almond. It is supposed sometimes to originate in wounds, in which a morbid exudation of gum takes place; but it appears to be more frequently occasioned by severe frosts, and to be very much dependent upon causes which induce a general unhealthiness. It very generally terminates in the destruction, not merely of the branch in which it originated, but of the whole tree, although trees in which it is in sure progress sometimes live for years, and meanwhile produce large crops of fruit.

A small fungus (Nemaspora croceus), which has been supposed to be the cause of gumming, more probably appears in consequence of it.

GUMRI, an old town of Russian Armenia, on the site of which the important city and fortress of Alexandrapol (pop. 11,358) have been recently built. The site is on the high-road to Erivan, and is 60 miles north of that town. A Russian fort is built at an elevation of 5860 feet above sea-level, and here the cold is so intense that men are often frozen to death in the fields.

GUMTI, a river of India, remarkable, as its name is meant to express, for its windings, rises in a small lake in lat. 25° 35’ N., and long. 80° 10’ E., and after a south-eastern course of 482 miles, enters the Ganges from the left in lat. 25° 29’ N., and long. 83° 15’ E. It is navigable for inland craft as far up as Lucknow, which is fully more than 300 miles above its confluence with the Ganges. At Jampore, about 56 miles from the Ganges, it is spanned by a bridge of 16 arches.

GUN, a term applied in its most general application to firearms of any description, but in the more restricted and technical sense to Cannon (q. v.). A gun is a frustum of a right cone, with a cylinder excavated round the axis, to serve as a bore. Close home to the end of this cylinder, the powder is driven, and outside it is the ball to be expelled. The several parts are shown in the figure below.

32-pounder Gun:

38. Length of gun; AC, first reinforce; CD, second reinforce; DE, chase; EB, muzzle; FG, bore; GH, axle; AR, neck; BE, breech cover; CG, base ring; dd, first reinforce ring; ee, second reinforce ring; ff, muzzle groove; pp, muzzle mouldings; A, shoulder of trunnions; b, diameter of bore, or caliber; c, k, trunnions; l, vent; m, breech; n, button.

The trunnions are cast in one mass with the piece, and are placed in the second reinforce in such a position that the breech-end of the gun outweighs the muzzle. Their axis is generally about half their diameter below the axis of the piece. This locality has several conveniences; but for the maximum of steadiness in the recoil, it has been shown that the axes of the trunnions and of the gun should exactly intersect. The use of the trunnions is to suspend the cannon on its carriage in such a manner that it may be readily depressed or elevated, but so that it shall have no horizontal motion which is not shared by the whole carriage.

The vent or touch-hole, the channel through which the charge is fired, is a small cylindrical orifice leading at an angle from the breech of the bore towards the base ring. The explosion within reacts with great force on the lower portion of the vent, and in case of rapid or long-continued firing, soon honeycombs the iron or brass, often dislodging considerable fragments. This, besides diminishing the regularity of the action of the powder on the projectile, would involve danger of bursting if permitted to any great extent. The gun so affected is therefore boucheted, that is, has a new vent constructed. The process consists of drilling a female screw, of larger than the required diameter, in the metal of the gun. Into this matrix, a bar of pure copper is screwed (copper being the metal least liable to fuse under the intense heat of ignited gunpowder), and the vent is then drilled through the copper. Sir A. Dixon devised the following simple mode: he rammed a cartridge of sand, only into the breech, then filled the vent and all the interstices with molten copper, and had only to bore a hole through the latter to complete the operation. In cases of great urgency, even this simple procedure may be shortened by the insertion of the stem of a tobacco-pipe during the filling; the pipe, when removed, leaves a perfect vent.

With reference to Riffled Cannon, some particulars have already been given under Armstrong Gun, and fuller details will be given under Rifled Firearms (q. v.).

GUN-BOAT, a small boat or vessel armed with one or more guns of heavy calibre. From its small dimensions, it is capable of running close inshore or up rivers, and from the same cause it has little chance of being hit by a larger vessel at the long range which the carrying power of its guns enables it to maintain. On the outbreak of the Russian war (1854—1856), as the British navy was without a single gun-boat, a large squadron of them was hastily constructed in 1855 and 1856, but too late...
for that special war. From the haste with which they were put together, most of those vessels proved defective. However, by aid of repairs and new construction, Great Britain has at this time (1862) about 180 steampun gun-vessels in a very efficient condition. Their tonnage is small; their horse-power ranges from 20 to 60 horses, and their very heavy armament usually consists of one 8-inch gun, and one 100-pounder Armstrong gun. A gun-boat is attached in most cases to some larger vessels, and constitutes a lieutenant’s command. In the last two wars with China, gun-boats have performed excellent service, having penetrated nearly to Peking, and far up the Yang-tse-kiang.

**GUN-CARRIAGE** is a very important element in the equipment of each piece of ordnance. It requires to be of great strength, and at the same time of considerable weight, in order that the whole apparatus—gun and carriage together—may not be driven backward by the recoil in firing. Field-gun carriages have, besides, to bear an enormous strain in passing at a rapid pace over broken, uneven, or rocky ground. To provide for this severe wear and tear, every part is fitted with the utmost precision, made of well-seasoned material, and on strict mechanical principles. A large department, fitted with splendid machinery, in the Royal Arsenal at Woolwich, called the Royal Carriage Department, is charged with this branch of manufacture for the British service. Carriages are of various kinds, according to the service for which they may be required; but the leading kinds—viz., those for field-service, and those for garrison or ship duty—are represented in the following figures, in

---

**Field Gun and its Carriage:**

A. block or trail; B. cheeks or brackets; C. axle-tree; D. ogive; E. trunnion-holes; F. wheel; G. felly; H. spokes; I. nave; J. tire or streak; K. rivet; a. eye or cap-plate bolts; b. napquar; c. axle-tree bands; d. heads of transom bolts; e. transom plate; f. perforated clipper; g. locking plate; h. trail plate; i. locking chain; j. trail handle; k. handspike ring; m. elevating screw; n. handles of elevating screw.

---

**Ship, or Garrison Gun and Carriage:**

A. side or bracket; B. trunnion; C. steps; D. trunnion hole; E. quoin.

Wheeled vehicle, capable of conveying the gun, its tools and ammunition, and several of its gunners. Information relative to certain species of gun-carrages will likewise be found under Swiftel and Platform Traverse.

**GUN-COTTON,** a detonating substance discovered by Schönbein in 1846, and obtained in the following manner. One part of finely carded cotton is immersed in 15 parts of a mixture of equal measures of strong nitric acid (sp. gr. 1.53) and sulphuric acid (sp. gr. 1.845). The cotton must be completely immersed in the mixture, otherwise it becomes so hot as to undergo immediate decomposition. After a few minutes’ immersion, it must be plunged into a large volume of cold water, and then washed till the moist mass ceases to show any acid reaction when placed on litmus paper. It is then to be carefully dried at a temperature not exceeding 170°.

Any substance containing cellulose, such as tow, linen, saw-dust, paper, &c., may be employed instead of cotton, and the change that takes place in the formation of the explosive compound seems, from the researches of Hadow, to be as follows: the composition of cellulose is represented by the formula C_{12}H_{14}O_{2}S. In the formation of gun-cotton or pyroxylin (derived from piper, fire, and zylopin, wood), nine equivalents of the hydrogen are replaced by an equal number of equivalents of peroxide of nitrogen (NO_2), so that the formula for the new compound is C_{12}H_{14}8NO_2-9S. The fibre, in undergoing this change increases more than 50 per cent, in weight, and acquires perfectly new properties. Although scarcely differing in appearance from unchanged cotton, it may be distinguished from it by its harshness, by the crepitating sound which it yields when pressed by the hand, by its having lost the property of depolarisation which ordinary cotton possesses, and by its electric condition. Iodine dissolved in a solution of iodide of potassium affords a certain means of distinguishing explosive from ordinary cotton. If the former is moistened with this iodine solution, and a little dilute sulphuric acid is subsequently added (one part of the acid to four of water), a yellow colour is evolved; while ordinary cotton wool, when similarly treated, assumes a blue colour. Its most remarkable property is, however, the facility with which it takes fire, and its rapid and complete combustion. In the open air it burns with a flash, but without smoke or report; and a temperature of somewhat less than 60° is sufficient to ignite it, being nearly 200° less than that required to ignite gunpowder. Authorities, however, differ very much as to the required temperature, which seems to vary with the mode in which the gun-cotton is prepared. Some specimens have exploded
when being dried at a temperature of not more than 132°. When fired in a confined space, it produces vis-à-vis explosive effects, from the suddenness of its combustion, and from the XNO gas. This gas is of gaseous matter which it yields. From numerous experiments, it appears that one dram will yield 130 or 140 cubic inches of gases reduced to the ordinary standards of pressure, and further, it has a penetrating power. These gases are carbonic acid, carbonic oxide, and nitrogen, with small quantities of carburetted hydrogen, cyanogen, and nitric oxide; and water is likewise formed in the act of combustion. Like gunpowder, it also explodes when sharply struck with a hard body.

In consequence of the suddenness of its combustion, and consequently of the short space of time during which its propulsive force is exerted; and further, in consequence of water or steam being one of the products of its decomposition, it is not applicable for firearms. It may, however, be beneficially employed in mining operations, and if mixed with nitrate of soda or saltpet, its strength is increased, and it produces less fumes and noxious vapours than gunpowder. There is much difference of opinion regarding the relative explosive forces of gun-cotton and gunpowder. According to Maury, one part of gun-cotton is equivalent to gunpowder, and four parts in blasting hard rocks, and equivalent to two parts of powder in blasting soft limestone; while other authorities regard one part of cotton as equivalent to six, or even to eight parts, of blasting powder.

The manufacture of cotton to its more general use in mining operations are, the difficulty of obtaining a product that possesses uniform properties, and the danger of employing a material which in some cases is nearly as safe and stable as gunpowder, and in other cases will explode on the application of a very slight heat or pressure, if not spontaneously. The results of Hadlow's investigations explain the conflicting statements relating to the properties of this substance. He has shown that its composition varies with the strength of the acids employed in its formation, and that in addition to the compound represented by the formula $C_6H_{12}N_2O_5$, which has been assumed in this article to represent the composition of gun-cotton, there are other gun-cottons represented by the formulas $C_6H_{12}N_2O_5$, $C_{25}H_{25}N_2O_5$, and $C_{28}H_{28}N_2O_5$, with the same ratio of elements of $H$ to the cellulose being in each case replaced by a corresponding multiple of the formula $NO_2$, and it may be that some compound which is best fitted for the preparation of Cordolion (q.v.) is that which is represented by the formula $C_{25}H_{25}N_2O_5$. It is obtained by using acids of a stronger intermediate between $HNO_3$ and $2HNO_3$ + $3AQ$ and $HNO_3$ + $2HNO_3$ + $4AQ$.

**GUN FACTORIES.**

ROYAL, are government establishments at Woolwich and Elswick, near Newcastle-on-Tyne, for the construction of great guns for the use of the British army and navy. For a very long period there had been at Woolwich a small factory for the manufacture of brass cannon, but guns of cast iron were obtained from private foundries by contract. At last it was determined that government should become in part its own gun-founder, and a branch was established near the Dockyards, and of this establishment 1853 to 1856. The adoption of the Armstrong wrought-iron gun into general use in the service, in 1859, arrested the further making of cast-iron guns, and occasioned again a great expenditure in the erection of shops and costly machinery. At this time (1859) when the whole establishment is in full work, the Armstrong factories may be counted among the most remarkable sights in the kingdom. In each department, whether in the present or past factory, the constant work of parallel lines of similar mills are seen, each busily fashioning a separate gun. Iron at red-heat is first wound round a solid core (representing the bore of the future gun), as tape might be wound round a pencil; and then by the action of successive blows from a steam-hammer, the strips are welded into a compact cylinder of wrought-iron of extreme density. This cylinder, after undergoing several heatings and pounding with the steam-hammer, is encompassed with wrought-iron rings of immense strength, and then transmitted to the boring-mill. Here the proper calibre is imparted to it; in another department, the bore is rifled; in another, the outside of the gun is carefully turned; and in yet another, the whole is polished and browned. A gun is several weeks in its passage through these many processes. By the ingenuity of Sir William Armstrong, the superintendent, and Mr John Anderson, his able assistant, every part of the difficult manufacture has been reduced to a question of machinery. About 2500 guns have to this time been turned out complete, and less than one per cent. of the whole number made have been finally rejected on proof. The cost of the guns as now (1862) made is, on an average, as follows: 12-pounder, £100; 18-pounder, £150; 40-pounder, £250; 70-pounder, £400; 110-pounder, £600. The total expenditure of the Board of Ordnance on these guns between 1856-1863 the sum of £292,883, of which £7525 are for management; £145,751 for the wages of 2529 artificers and labourers; £6375 for buildings; and £132,232 for stores to be consumed in the manufacture of guns.

The establishment at Elswick is more in the nature of a contractor's foundry. It was originally the manufactory of Sir William (then Mr) Armstrong & Co., engineers and founders, and in it was originally developed much of the machinery for making Armstrong guns; it is now used as an auxiliary and supplement to the gun-factory in Woolwich arsenal, the guns being turned out at a contract price, payable after they have passed a rigid inspection.

**GUNDAMU'K,** a village of Afghanistan, claims notice merely in connection with the fatal retreat from Cabul in 1842. It was here that the last remnant of the British force, when within 28 miles of the shelter of Jellalabad, was massacred, to the number of 1000 men and 300 camp-followers, only one man effecting his escape.

**GUNDU'K,** a river of India, joins the Ganges from the left or north side, opposite to Patna, after a south-east course of about 400 miles. It is supposed to rise beyond the Himalaya, in lat. 20° 40' N., and long. 83° 14' E., while its remote source within that range is said to be at the foot of Dhawalagiri. After a course of 200 miles, it becomes navigable for boats of considerable burden. Near this point, the river touches the British territory, dividing it for 15 miles from Nepal.

**GUNDULITSCH,** Iwan, the most celebrated Serbian poet of earlier times, was the son of Francis Gundulitsch the historian, and was born 8th August 1858, in the town of Ragusa. After he had completed his primary education and philosophic studies under his father, he went to the Jesuit College in Ragusa, and in 1832 he became a Jesuit. In the age of 21, to the science of jurisprudence, in which he made such rapid advances, that in spite of his youth, he was intrusted with the first offices of the Ragusan republic. He died in 1838. On the 20th December 1838, the bishop of Ragusa blessed himself, and the dean, in the presence of the grand requiem was sung in memory of the poet, in the Academic Church of Agram.—G.'s poetical works, lyrical, dramatic, and epic, are a faithful mirror of the turbulent time in which they were composed. He was the most dramatic master of the
Slavic race, and the theatre of Baguas, on which his richest and most celebrated work is an epic, The Osmanli, in 20 cantos, in which he sings the deeds of Osman II, and the fame of the Poles and their king, Wladislaw IV., in the campaign of 1621.

The best edition was published at Baguas in 1620; the latest edition is that of Gaj (Agram, 1844). Of his dramas, may be mentioned Ariadne, The Rape of Proserpina, Galatea, Dana, Armida, The Sacrifice of Love, Cerse, Cleopatra, Adonis, and The Coral; of his poems, Hymn on the Greatness of God, and The Tears of the Afflicted Son. G. also made several translations from the Italian poets.

**GUNMAKING, GUN-TRADE—GUNNER.**

Although gunnery and gun relate almost wholly to great guns or cannon, the word gunnaking is always applied to the manufacture of small-arms, comprising muskets, rifles, pistols, and carbines. In England, the great seat of this trade was formerly London, whose workmen stood unrivalled throughout Europe for the excellence of their products; but of late years the gunmakers of Birmingham have succeeded, from local advantages, in turning out barrels of proved power at such a price as to defy competition. Since then the London makers have confined themselves to "finishing," or putting together, an art requiring the utmost nicety; and even in this, the skilled labour of Dublin and Edinburgh has now nearly equalled them. There are, therefore, several centres in the United Kingdom whence first-rate arms are to be obtained; but, as a whole, the manufactures in Great Britain bear off the palm over all the world, though St Etienne, Liege, Vienna, Suhl, and the United States bid fair to overtake them in the future.

Machinery has been comparatively slow in being applied to the manufacture of small-arms, but during the last few years it has made giant strides; and now the government manufacture at Enfield, in which numerous ingenious machines have been introduced from the United States, is fitted with every mechanical appliance, and can turn out many thousand arms per annum, each of which so exactly corresponds to pattern, that all parts are interchangeable.

Barrels, instead of being forged by the hammer, are rolled at once with a uniform pressure, and then welded at one heat. In the United States they are now made from slabs of cast steel, first formed in the solid, and then bored by a succession of borers of increasing diameter. These cast-steel barrels are rapidly superseding all others—at least for sporting purposes—in Great Britain, France, and America. Another favourite modern material for barrels is "laminated steel." See BARREL. Barrels well constructed of laminated steel resist a bursting pressure of 82,000 lbs. on the square inch one-eighth of an inch thick, whereas common "twist" barrels will only withstand about 34,000 lbs.

When the barrel is finished, however made, it is proofed, under very heavy charges of powder. All new guns are therefore "proofed" by being made to withstand charges which they will be subjected to in action; and in this way, though the trade command excellent wages; rarely less than 30s., and often as much as £3 a week.

In fitting and finishing, London is generally admitted to stand unequaled; Paris, however, making a good and near second. For barrels, Birmingham, St Etienne, and Liege have the most repute. In all respects, Toledo, once famed for its blades, holds a high character in regard to its guns, both for sporting and military purposes. In the United States, Windsor and Hartford are the leading manufacturers, with Harpers Ferry for government arms; but the quality of American workmanship is too often sacrificed to cheapness in the article turned out. The British export trade in small-arms is very great, the return for the year 1860, when peace reigned in America, shewing 260,921 stand of a declared value of £333,283.

**GUNNEL (Gunnellus, or Muranoides),** a genus of fishes of the Blenny (q. v) family, of more elongated form than the true blennies. The species are pretty numerous, but only one is British, the Common or Spotted G. or Butterfish (G. vulgaris), often to be found in tide-pools on the sea-shore; seldom more than six or seven inches long; of a deep olive colour, with a row of dark spots on the back, remarkable for the quantity and thickness of the mucous secretion with which it is covered. It is seldom used in Britain except for bait.

**GUNNER, in the British army, is the private soldier of the corps of artillery; he receives £3. 3s. 6d. per diem, besides a penny a day for beer: his uniform is blue with red facings, and red stripes on the trousers; and his arms consist of a carbine and sword-bayonet.

At the present time, when artillery is used with the utmost skill and science, the training a gunner must undergo, to become thoroughly efficient, is long and arduous. His eye must be sufficiently acute to estimate distances instantly and proximately; and withal, he must possess physical strength capable of sustaining the exertions necessary for the service of heavy guns and the removal of shot and ponderous artillery stores.

**Master-gunnery** are pensioned sergeants of artillery, who are placed in charge of the stores in small towers or forts; they are divided into three classes, of which those in the first class receive 5s. in the second, 3s. 6d., and in the third, 3s. a day. Master-gunnery are now borne in the Coast Brigade of Royal Artillery, but the office has much degenerated in importance since it was first created, at least as early as the time of Henry VIII.

In the navy, the gunner ranks first among the warrant-officers, and next in order to the second master in regard to taking command of a ship. His pay varies on sea-service from £5. 7d. to £6. 6d. a day, and on harbour-service, from 3s. 7d. to 3s. 6d. a day. His uniform consists of a blue coat, blue cap,
and officer's sword. A gunner rises from before the mast by steadiness, sobriety, and intelligence. On appointment, he must satisfy examiners appointed by the Admiralty that he is in all respects qualified. His duties are highly important; he has charge of all powder and artillery stores on board, and is bound to see that the guns are always fully equipped for action. In exercising with the guns, the gunner is instructed of the fuzes, and, under the captain, is responsible for their efficiency. The gunner's mate is assistant to the gunner, and stands second among the petty-officers. To be confirmed in his rank, he must pass an examination in gunnery on board H.M.S. Excellent, at Portsmouth. His pay varies from £3, 9s. 3d. a month to £3, 2s. 6d. Gunners—gunners are continuous service sailors, who are trained in gunnery and great-gun exercise. One has the direction of each gun, with ordinary seamen under him. A gunner, if in the 1st class, receives 4½d. a day beyond his pay as seaman, and 2d. a day if in the 2d class.

GUNNERY. Ignorance of the laws of gravity and air resistance causes accidents affecting the flight of projectiles, prevented any correct theory of gunnery being arrived at in the earliest ages of artillery. The first author professedly treating on the flight of cannon-shot was Nicolas Tartaglia, a大切な数学家, who in 1530 published his work, *La Nuova Scienza*. However, he had no practical acquaintance with his subject, but his guesses were shrewd and often marvellously near the truth. Among other things he ascertained that no projectile of the form of a parabola advances as well as a practical aid to artillers, he devised the gunner's Quadrant (q.v.). After Tartaglia, many philosophers, especially of Italy, theorised on the question, and, among the many tables of ranges, elevations, charges, &c., had been published, all more or less fallacious, when a nearer approach to accuracy appeared in Galileo's *Dialogue on Motion*, printed in 1638. The officers who had charge of artillery in actual use were to a little greater with scientific education it is a deduce theory from practice; and up to the time of Robins, who wrote in 1742, but four working-gunners—Collado, Brown, Eldred, and Alderson, of whom the last three were Englishmen—have left treatises on the subject. Galileo, in his contributions to physics, had shown that cannon-shot, or any other projectiles, being affected by the downward force of gravity, would travel in the curve of a parabola, unless affected by the resistance of the air. The philosopher pointed out the most modes by which the disturbances caused by this resisting medium might be ascertained; but subsequent writers, with the exception of Newton and Bernouilli, till the time of Robins, chose to assume that the atmospheric resistance of a body was but nominal, and boldly asserted that all shot described parabolas in their course. In 1742, Mr. Benjamin Robins, who must be considered the real founder of the science, published his *New Principles of Gunnery*, a work the result of long and almost exhaustive experiments. He treated of the atmospheric resistance, of the force of gunpowder, of the effects of varying length and weight in guns, and of almost everything which in any way relates to the motion of projectiles, carrying the theory of gunnery nearly to perfection. As one result of his experiments, Robins established the law that common shot encountered a resistance from the air during their passage, which increased as the square of the velocity, or very nearly so; and that their courses differed widely from parabolas. By means of the Ballistic Pendulum (q.v.), he measured the speed of balls at the very cannon's mouth. Euler, in the latter part of the 18th c., added much to the knowledge of the subject by his commentaries on the work of Robins; as did also the mathematician Hutton.

The theory of gunnery, so far as it can be deduced from the universal laws of motion, without regard to the resistance of the air, falls under the more general head of Projectiles (q. v.), but except in firing large guns, which fire first feet per second, the maximum is much so much affected by the resistance of the air, that the more mathematical theory is of little service. All the real practical rules have been deduced from experiments. The following are a few of the more important results thus arrived at.

For a given charge and weight of projectile, there is a certain length of bore that gives the greatest velocity; the cause being, that with a less length some of the powder is discharged undecomposed, and with a greater, the combustion is finished before the ball leaves the muzzle, so that it has to contend with the friction of the gun without receiving additional impulses. Increase of length, accompanied by proportionate increase of charge, gives increased velocity; but the greater velocity is only proportion to the cubic root of the increased length.

The resistance of the air does not arise merely from the projectile having to displace its own bulk of it as it advances; for in the case of a body moving with great velocity, the air becomes consciousness in front of it, while that behind is highly rarified. The displaced air behind does not return freely to fill up the vacuum, until the speed of the ball is reduced to 1400 feet per second; the maximum profitable velocity is calculated to be 1600 feet, and that, or any higher speed, is believed to be reduced to 1400 feet after a course of 400 feet.

The resistance offered to bodies by the air is as their surfaces, i.e., in the case of round or cylindrical shot, as the squares of the diameters; whilst the power of the bodies themselves to overcome resistance is as their weights, or as the cubes of their diameters. Of course balls of like size but different density will produce widely different results. Hence the greater range of solid as compared to hollow shot. Solid shot fired with equal velocities and elevations, range as their weight, the heavier overcoming atmospheric resistance better than the lighter. Shot of equal weight and diameter will range according to their velocities; but not in direct proportion, for the retarding power varies as the square of the velocity. Velocities of shot of equal diameter are as the square roots of the charges.

The diminution in speed caused by atmospheric resistance may be judged of from the following table of the speed of a 32-pounder at different parts of its course; it being presumed that a body in vacuo, once started, should move ad infinitum, without decrease of velocity:

Action and reaction being always equal and in opposite directions, the explosion of the gunpowder acts with equal force upon the ball and upon the cannon from which it is discharged, the former demonstrating this in its range, and the latter by its recoil. This recoil has to be guarded against as much as possible, either by the weight of the gun itself, or by its secure attachment to a ponderous carriage. The momentum of the recoil, being the product of the shot's weight and the velocity, is readily calculated. The common charge of a
GUNNY BAGS—GUNPOWDER.

24 pounder gun, being one-third the weight of the shot, or eight pounds, the momentum of both shot and gun, will be 16 lb (the initial velocity) x 24 = 388,400, which, divided by 5000, or the gun's weight in pounds, gives about seven feet as the velocity per second; if the gun is attached to a carriage, the weight of the carriage must be added to that of the gun for a divisor.

The following table exhibits the effects of varying charge and elevation on different kinds of guns. It will be readily understood by reference to the accompanying diagrams. The line of sight of a gun is an imaginary line drawn through the back-sight on the breech and the fore-sight, a notch in the muzzle ring, or on the first re-inforce (see fig. 1, where ABC is the line of sight). The fore-sight B is immovable, but the back-sight A is so constructed that the notch shall be at a greater or less height above the axis of the gun. When the line ABC is parallel to the axis and horizontal, the discharge is 'point-blank'; but when the back-sight is raised, the direction of the axis of the gun will be to a point more elevated than that to which the line of sight is directed, as in fig. 2, where the original impulse received by the shot is towards D. Consequently, by raising the back-sight, a greater elevation, and, ordinarily, a greater range, is given to the piece. In regard to point-blank discharge, Tartaglia established the fundamental proposition that the time occupied by the ball in describing the whole trajectory or path is the same as it would require to fall by gravity from the muzzle to the ground.

As regards penetration, it was found by experiments against a martello tower at Eastbourne, with a range of 1832 yards, that solid shot from the 40-pounder Armstrong penetrated into good masonry from 47 to 65 inches, and from an 80-pounder Armstrong 51 to 90 inches. For other particulars relative to the art of gunnery, the reader is referred to LOADING, PROJECrTERS, WINDAGE, &c.

GUNNY BAGS are bags made of a coarse kind of cloth or sacking, manufactured in India, and chiefly in Bengal, from which they are largely exported to other parts of the world. The fibre, which, heretofore was wool, is now chiefly made of the same species of Corchorus, which yield the jute (q. v.) of commerce. The cotton of America is mostly packed in gunny bags, of which the number exported to America from Bengal in 1796 was 34,000, but had increased to 8,729,185 in 1851.

Great quantities are also exported to China, Australia, and other countries. They are partly made up into bags in Bengal, partly exported as Gunny chutes or chutes, pieces of size suitable for being immediately manufactured into these bags. The manufacture of this great domestic industry of all the populous eastern districts of Lower Bengal. It pervades all classes, and gives occupation to men, women, and children. Boatmen employ themselves in it in their spare moments, husbandmen, palanquin-carriers, and domestic servants, being Hindus, for Mohammedans spin cotton only.

It forms the never-failing resource of that most humble, patient, and despised of created beings, the Hindu widow, saved by law from the pite, but condemned by opinion and custom for the remainder of her days, literally to sackcloth and ashes, and the lowest domestic drudgery in the very household where once, perhaps, her husband lay. (Boyle's 'Famous Plants of India.') Hence the very low prices at which gunny bags are sold. There are few articles of commerce so widely diffused over the globe as the Indian gunny bag.

GUNPOWDER, a well-known explosive mixture composed of sulphur, nitre, and charcoal. Of use in several trades, its principal employment is in the discharge of war or sport, of projectiles from firearms, and in the processes of blasting during mining or quarrying. The history of gunpowder has been already given under FIREARMS (q. v.), and it will therefore be only necessary now to consider the chemical action which takes place when the powder is ignited, and then to proceed to a short description of the manufacture.

Extreme care is requisite in securing the purity of the ingredients entering into the composition of gunpowder. The principal impurity of nitre or saltpetre is chloride of sodium, or common salt, which, in consequence of its tendency to absorb moisture from the atmosphere, would have a very injurious action on gunpowder by weakening its power. The details of the process of purification of the nitre would be out of place in this article. The sulphur may be purified either by fusion (when the heavier impurities sink, and the lighter ones may be removed by skimming) or by distillation. The preparation of the charcoal is a most important point. It should be light and porous, should yield a very small amount of ash, especially of carbonates of potassium and other deleterious salts, and should contain little moisture. The wood from which the best charcoal for gunpowder are black alder, poplar, spindle-tree, willow, and dogwood, the last named giving off the largest volume of gas when ignited with a given weight of nitre, and being on that account especially used for rifle powder.
GUNPOWDER.

A vast number of experiments have been made at different times, and by different nations, to discover the proportions of nitre, sulphur, and charcoal best adapted for the production of different kinds of gunpowder; and upon the whole there has been great uniformity in the results, as may be seen from the following table of the percentage composition of the powder of different nations:

The chemical processes which occur in the ignition of gunpowder are commonly described as follows:

When the powder is ignited, the oxygen of the nitre combines with the charcoal or carbon to form carbonic acid, the potassium combines with the sulphur to form sulphide (or sulphur), and potassium, and the nitrogen is liberated; the reaction being shown in the equation $\text{KON}_2 + 3\frac{1}{2}\text{S} = \text{K}_2\text{SO}_4 + \text{NH}_3$. Powder consisting of equal parts of charcoal and carbon and one third part of sulphur, would contain 548.4 per cent. of charcoal, 133.3 per cent. of carbon, and 133.3 per cent. of sulphur. One part of such powder would yield 112.65 volumes of mixed carbonic acid and nitrogen gases, after the ordinary reduction for temperature and pressure. Although the intense heat developed at the moment of explosion the actual dilution amounts to at least 1500 times the volume of the powder employed. The only solid residue, supposing the above equation to represent the true reaction, is sulphide of potassium (KS), and part of this is volatilised by the heat of the explosion, causing a whitish smoke by its combustion, while the matter that is not burned gives the peculiar odour to the washings of the gun-barrel.

If a larger proportion of charcoal is added, more or less carbonic oxide gas is produced as a product of combustion. Blasting powder is so composed that, theoretically, it should yield on explosion a mixture of carbonic oxide and carbonic acid gases, and leave a residue of charcoal and potassium sulphide. This is expressed by the equation $\text{K}_2\text{SO}_4 + 2\text{C} = \text{CO}_2 + 2\text{CO}_2 + \text{N}_2 + \text{K}_2\text{S}$. A powder composed according to this formula would contain 64.4 per cent. of charcoal, 20 per cent. of potassium, and 15.2 per cent. of carbon; and the proportion actually employed is 65, 20, and 15, respectively.

Recent investigations of Bunsen and Schlessoff (Fogedler’s Annalen, Bd. 102, p. 321) show that in reality the chemical reactions are very far from being as simple as those given in the preceding paragraphs; the solid residue consisting of various compounds of potassium (sulphate of potash being in greatest quantity), with portions of nitre and carbon.

The ignition of gunpowder must be distinguished from its combustion. The powder is ignited when a portion of it begins to develop light and heat; this in granulated gunpowder commences from the points in which it is first set on fire, from the heat from the heat of the flame of the match, and from the heat of combustion; but still, it is important to bear in mind, by successive ignitions. Combustion means the final and total decomposition of each grain separately, and the complete liberation of its component gases. In gunpowder these phenomena follow each other so rapidly, that, unless the mass is spread over a considerable space, they appear simultaneous. The heat spread around by each grain during its combustion suffices to ignite all other grains within a sphere of six times its own diameter. This serves to account for the almost instantaneous communication of the flame throughout the whole quantity exposed. The granulation of gunpowder has a great influence on the rapidity of its ignition; the larger the grain, the more rapid is the ignition, but the slower the combustion. On the other hand, small-grained powder ignites more slowly and burns with greater speed.

When mealed or finely powdered gunpowder is employed, it readily inflames, from the presence of the ordinary ingredients; but there being no interstices, the conflagration spreads but slowly, and therefore the detonation is powerfully retarded. It thus happens that mealed powder exhibits less explosive power and less rapidity of combustion the closer it is pressed together, a circumstance taken into account in the manufacture of fireworks.

In rifled guns and muskets, where it is desired that the projectile should expand to the shape of the grooves, it is obviously best to have a powder which, by very rapid ignition, creates the utmost pressure, and which, by its continued combustion, maintains an increasing degree of heat, which shall further augment the explosive force of the gases evolved up to the period of time at which the projectile is driven from the muzzle of the weapon. With this object in view, there is clearly the most suitable, although a contrary view has been long accepted; and that to so great an extent, that some among the recent inventors of rifled arms have had to complain that the only gunpowder they could obtain has been far too good for their purposes.

Process of Manufacture.—The three ingredients being taken to separate mills, are reduced by successive grinding into a very fine powder. Although several materials are then taken to the mixing-house, where they are weighed out into their respective proportions. The charcoal is spread in a trough, and the sulphur and nitre being sifted upon it, the whole are incorporated, though imperfectly, by the hands. The next process is in the powder-mill, where the mixture is ground between millstones, and thoroughly incorporated in a wet state. So dangerous is this part of the manufacture, that makers are obliged to grind more than 42 lbs. in the same house at one time; all the bearings of the machinery are of copper, lest heat should be generated by the friction. According to the quality into which the powder is desired, this triturating is continued, from one to two days, until that usually employed, and three hours the period in the government factory. The powder, completely pulverised and caked by the moisture and the pressure, leaves the mill in small lumps, called mill-cake. This mill-cake is then spread between copper-plates in layers about 3 inches thick, and is subjected to an immense pressure either by a screw-capstan or by a hydraulic engine.

The next operation is graining, a process to which, as already explained, gunpowder owes its rapidity of ignition, and its consequent explosive power. This is performed by forcing the mill-cake through minute holes in a circular parchment sieve, the grains being kept in motion by centrifugal force. The grains thus formed are, however, of very various sizes; and that the gunpowder should be homogeneous, it is necessary that they should be forced into the small sieve, or grainer. This is done by the intervention of a series of sieves of different degrees of fineness.

The last processes are drying, glazing, and freeing from dust. The first is effected by heating the powder to a point sufficient to drive off moisture;
the second, by the friction of the grains together in a revolving cylinder; the third, by the centrifugal action caused by the powder being twisted round in a gauge cylinder, when the dirty (formed in the polishing) flies off through the gauge, and the bright grains remain as finished gunpowder.

This is the modern system—a system involving considerable personal risk at every stage: for the fine dust becomes so diffused through the atmosphere in the mills, that the slightest spark would blow the whole into the air in a moment. The early process of manufacture was, however, even more dangerous. What with the stirring, and pounding, and spirit (which our forfathers used instead of water, in the idea that a strong fluid would impart strength to the mixture), it was probably to the impurity alone of the materials that the operators were indebted for not being blown to pieces.

The following are the chief properties of gunpowder. Good powder should be perfectly uniform in texture, and should not present any light specks or glittering points. The grains should be sufficiently hard not to be easily crushed by the fingers, or to soil them, or a piece of paper, by mere contact. If infarmed on white paper, it should blacken it but slightly, should have no account set fire to it; and should have a little heat without any flame. The slight temperature at which it explodes has been carefully studied by Violette, who obtained the following results:

The most combustible of these powders was the one containing the largest amount of sulphur, which is the ingredient most ready to enter into ignition. When gunpowder is exposed to a heat of 500°, the whole of its moisture is expelled, and the nitre and sulphur are reduced to the fluid form. On cooling, such powder is found to be intensely black; and the grain has become infiltrated, and is no longer able to imbibe moisture. Powder is inflamed by any burning substance, by red-hot metal, by the electric spark, or by the violent concussion even of comparatively soft bodies, if it be sufficiently powerful. For example, powder placed upon lead, or even on wood, will be ignited by the shock of a head of a bullet fired at it. Its specific gravity is about 1.875.

The nature of the residue which is left after the ignition of the powder has been already explained. The following article, the legislation by which the rules are avoided, rest to some extent by the lubrication of the barrel with a little fatty matter. The adhesion of the ash is thus prevented, and it is more or less expelled by the escaping gases.

The manufacture of gunpowder is carried on to a great extent in Great Britain, the exports in 1860—before the American civil war, which has doubled the amount—being 11,978,436 lbs., of a declared value of £5,83,101. Of this large quantity no less than 62,000 lbs. were exported to non-British ports on the west coast of Africa.

**GUNPOWDER, LAWS RELATING TO.** In order to guard against the frightful consequences to the public likely to arise from carelessness in the preparation, preservation, or conveyance of this most destructive of all materials, stringent rules upon the subject. By 12 Geo. III. c. 61—an act which applies both to Scotland and England—it is provided that no gunpowder shall be manufactured except at mills having a licence from government, under pain of forfeiting all the powder made at the mill. In consequence of the increased danger attendant on the use of pestles in the manufacture, it is enacted that pestles shall not be used in any mills except in those specified in the act. In no mill shall more than 50 lbs. of powder allowed to be made or dried at one time, and no greater quantity of powder is allowed to be kept in a drying-house than is necessary for the immediate work that is being carried on. It is also required that.aspurred powder shall be kept at a distance of at least 500 feet from any built erection, and that the powder, as soon as possible after manufacture, shall be conveyed to the magazine. No dealer in gunpowder is allowed to keep more than 200 lbs. of powder upon his premises at one time, and it is not permitted that more than 30 lbs. weight should be kept in store for mining purposes. In transmitting gunpowder from place to place, it is not allowed to carry more than 25 lbs. at once by land, or 200 lbs. by water; and any one smoking on board a ship which is laden with powder, is liable to a fine of £5. In order that no danger may accrue in the transmission, any person delaying the loading or unloading is liable to a fine of £10. For the special protection of the docks and shipping in the Thames, it is enacted that no vessel lying above Blackwall shall carry more than 15 lbs. weight of powder, and that vessels coming from or going to any port below that point; while vessels coming up must land their powder before reaching Blackwall, or within 24 hours after they have come to an anchor. By 9 and 10 Vict. c. 25, which is an act for preventing injuries by explosive substances, anyone manufacturing powder for a purpose prohibited by the act may be imprisoned for two years. Justices of the peace may issue warrants for searching in the daytime any shop, cellar, yard, or other place where gunpowder is suspected to be unlawfully secreted. The legislature has also passed special enactments as to the making and use of fireworks. The exportation of gunpowder may at any time be prohibited, by proclamation or by an order in council; 16 and 17 Vict. c. 107, s. 45.

**GUNPOWDER FACTORY, ROYAL, at Waltham Abbey, an establishment in which much of the gunpowder required for the British army and navy is made. It is built on all the newest and most approved principles to insure safety, economy, and efficiency of working. Although accidents have happened in this dangerous manufacture, and roofs and sides, purposely left loose so as to offer but little resistance, are scattered to the winds. Between the different mills many are planted, and groves of trees thickly planted, to lessen the concussion, and, as far as possible, limit the catastrophe when one house is unfortunately exploded. A series of raised canals, at the same time, is ready to flood the whole place, or to afford a precarious shelter to the men employed, if time be available to make use of it. The charge for this factory for 1862—1863 is £19,679, of which £12,349 go in management and wages, £2586 for buildings, and £4744 for raw material. The number of workmen employed is 156. When the gunpowder is made, it is despatched by water-transport down the Lea navigation, to be stored in the great warehouses at Woolwich and Furthet.

**GUNPOWDER PLON, TIR, was a fantastic project in the part of a few Russian Catholics to destroy the King, Lords, and Commons on the meeting of parliament on the 6th November 1665. James I. had succeeded Elizabeth two years before, and his government had exercised great severities against the Papists, and all those the Crown would call them religious toleration, but confiscating their
GUNROOM—GUNSHOT WOUNDS.

Property. A few ruined and esparated men banded together to overthrow the government. The originator of the plot was Robert Catesby, a man of fortune, who had impaired by youthful extravagance, and who communicated his idea to Thomas Winter, who was horrified at first, but after a time began to approve and further it. For this end he enlisted into the conspiracy Guy Fawkes, a soldier of fortune, of considerable military experience, and the most determined and fearless of Catesby's associates. This latter was known by name Wright and Percy—the latter a relation of the Earl of Northumberland. They hired a house and garden contiguous to the parliament house, and placed it in the 6th November, after the others, and the rubbish being buried during night. One day they were alarmed by a noise after they had with much labour pared the wall three yards thick. Fawkes learned that this noise proceeded from a cellar under the House of Lords, which would soon be vacated. He hired it, and barrels of gunpowder were placed in it, and stones and billets of wood placed over them, for the double purpose of concealment and to act as destructive masses when the powder was fired. In the interval, a brother of Wright and a brother of Winter had been added to the conspirators, so they were now seven. But they wanted money; and to supply it, two others were introduced, to enter this fantastic enterprise, and these were Sir Everard Digby of Gatchurch, in Buckinghamshire, a young gentleman of large estates; and Francis Tresham, a follower of Essex, like Catesby and Percy, but unlike the others enthusiastic—not a man at all suitable for conspiracy, except that he had two thousand pounds to contribute. Their plan was finally arranged for the reassembling of parliament, which was to take place on the 6th November; Fawkes was to fire the mine (if the gunpowder in the cellar may be so called), and then flee to Flanders by a ship provided with Tresham's money, and waiting ready on the Thames. All the Roman Catholic peers and others whom it was expedient to preserve, were to be prevented from going to the parliament house by some pretended message or other, on the morning of the day. After all was ready, Lord Montague was at supper at his country-house at Hartfield, he very seldom went abroad. As the host page handed him a letter received from a stranger, advising him to devise some excuse to shift your attendance at this parliament, for God and man hath concerted to punish the wickedness of the time.' That this letter was written by or for Tresham, who was Lord Montague's brother-in-law, there can be little doubt. That he desired to save him was certainly one reason for writing it; that he desired to save the conspirators, or at least to allow them to escape, is very probable; and that they might have escaped, but for the fanatical hopes of Catesby, is all but certain. It is also probable that Lord Montague had been fully informed of the whole matter by the time the letter was written; for that the upper in the country and the letter were mere devices to conceal Tresham's treachery. When the letter was formally comunicated to the king, he at once declared its meaning, and the most suppine of the privy council at that time is supposed to be that, like Lord Montague, he had been told beforehand. On the very evening of the 4th, the Lord Chamberlain and Lord Montague visited the parliament house, and entered the cellar in a casual way, told Guy Fawkes, whom they found there, and who passed as Percy's servant, that his master had laid in plenty of oil. Only fanaticism gave the length of fatuity could have made him persevere after this. But he did, though escape was still possible; and on the morning of the 5th, a little after midnight, he was arrested coming out of the cellar, dressed as for a journey. Three matches were found on him, a dark-lantern burning in a corner within, and a hogshead and thirty-six barrels of gunpowder. He was examined and tortured. He confessed his own guilt, but would not discover his associates. However, he and the chief of them were either killed on being captured, or died on the scaffold; except Tresham, who at first walked about openly, but at last was apprehended, and died of a natural disease in the Tower. The memory of this plot, invested by much fiction, has survived in England; and it was not more diabolical than hopeless and mad. It was in itself mysterious, and for purposes of state policy and Protestant zeal, a further mystery was thrown over it. No name in English history has been more detested than that of Guy Fawkes (q.v.).

GUNROOM, in British line-of-battle ships, is the common cabin of officers below the rank of lieutenant (with the exception of the assistant-surgeon, who sits in the wardroom). In frigates and smaller vessels, the gunroom is the room of the lieutenants, master, surgeon, assistant-surgeon, paymaster, marine officers, chaplain, and chief engineer; the junior officers being in those cases consigned to the cockpit.

GUNS (Magyar, Készeg), a small town of Hungary, situated on a river of the same name, about 57 miles south-south-east of Vienna. It is inhabited almost wholly by Germans, who are the descendants of Bavaro-Frankish colonists that settled here in the 9th c., and who speak a dialect differing from any other German dialect. Fruit and wine are largely cultivated. Pop. 6400. G. made itself for ever famous by its noble defence for 28 days against the Turkish army under Solyman in 1542. This defence not only forced the Turks to retire, but afforded time for the Emperor Charles V. to assemble a force strong enough to oppose them.

GUNSHOT WOUNDS may vary in severity from a simple bruise to the tearing away of a whole limb. Single bullets produce a cut, bruised or lacerated wound, according to the amount of their velocity when they strike the body. As the bullet proceeds, the distance varies with the power of the gun; and when, close, the charge enters with the pellets so close together as to make one wound like a single ball. Some years ago, it was supposed that the 'wind of a large shot' could produce serious injuries; this belief may have arisen from the circumstance that when a heavy ball, which has lost some of its force, strikes the body at a particular angle, the skin does not always give way, but the deeper structures, such as the muscles, or large organs, as the liver, may be completely crushed. If the wind of a shot could kill a man, it is not likely that soldiers should have had ears, noses, or lips shot off, and yet we have experienced only the symptoms produced by those slight injuries.

When a bullet passes out of the body, there are two openings—that of entrance, which is generally depressed, round, regular, and smaller than that of 'exit.' The modern conical ball makes a well-defined oblong wound, but it may shift its direction, so as to strike longitudinally, and cause a more extensive injury to the skin. When a bullet strikes the shaft of a bone, it cracks or splinters it, and either remains or passes through the cancellous ends. In its course, the ball may carry before it pieces of cloth, bones, or other foreign bodies, which increase the danger of the wound. Many persons...
who have been shot during the excitement of battle, describe the sensation as resembling the sharp stroke of a cane; but in most instances the injured man begins to tremble, as if in an agony of fear, and the face becomes pale, his pulse scarcely perceptible, and he appears as if about to die. This is the condition termed shock; and though death sometimes does ensue during this state of prostration, it is not so serious as it appears, and if the patient will probably pass the few hours with the help of stimulants and rest. Although excessive bleeding is not so common after gunshot as other kinds of wounds, it may occur immediately to a fatal extent, if assistance be not afforded. This assistance any one can give; it consists simply in placing the fingers in the wound, and if the vessel can be reached, pressing them upon it, directed to the proper point by the warm gush of blood. Should the wound be too small to admit the finger, a handkerchief may be tied round the limb above the wound, and twisted tightly with a stick. It is well to examine the wound, to ascertain the extent of the injury done, and whether there are splinters of bone or portions of dress or ligatures in it, which should be removed. But neither the examination nor the removal should be attempted if they seem likely to aggravate the injury. The treatment is similar to that of other wounds, and consists in protecting the part during the healing stages, moderating inflammation by cold-water dressings or soothing poultices, and hastening the last stages of cure by stimulating lotions. During his illness, the general treatment of the wounded man must depend upon so many different circumstances, that it would be out of place to enter upon them here.

GUNTER, EDMUND, an English mathematician, was born in Hertfordshire, in the end of 1590 or the beginning of 1591. He was educated at Westminster School, and afterwards at Christchurch College, Oxford. While at Oxford, he gave his attention principally to the study of mathematics, and in 1606 invented the sector, with the lines known as Gunter's Scale. Subsequently, he took orders, became a preacher, and took the degree of B.D. But the best of his mind being strongly towards mathematical studies, he obtained the professorship of astronomy in Gresham College on the 6th March 1619. He died 10th December 1626. The principal works of G.'s are the following: Canon Triangulorum (Lond. 1620), a table of logarithmic sines, &c., to seven places of decimals, being the first table published in accordance with Briggs's system; in this work, we find for the first time the words 'cosine,' 'cotangent,' &c.; Of the Sector, Cross-staff, and other Instruments (1624). We also owe to G. the invention of the surveying-chain (see next article), and the first observation of the variation of the compass.

GUNTER'S CHAIN, GUNTER'S SCALE. Gunter's chain, so named after its inventor, is that commonly used by surveyors in measuring land. It is 66 feet long, and its convenience in practice turns on the fact, that ten square chains make one acre. The chain is divided into 100 links, and thus 100,000 square feet make an acre.

The name of Gunter's Scale, or Gunter's Lines, is usually given to three lines to be seen on almost any sector, and marked N, S, T, meaning the lines of logarithmic sines, of logarithmic cosines, and of logarithmic tangents. To understand their construction and use requires a knowledge of logarithms; they are explained in every school-book of practical mathematics. The distances of the divisions marked 1, 2, 3, &c. on the line of log. numbers, represent the logarithms of those numbers—viz., 0, 301, 477, &c.—taken from a scale of equal parts. The other lines are constructed on an analogous plan. Calling to mind that multiplication of numbers is effected by the addition of the logarithms, division by their subtraction, inversion by their multiplication, and evolution by their division, we are able to perceive with what ease many rough problems in areas, heights, curvilinear contents, and other matters may be performed through the agency of Gunter's Scale.

GUNTUR, a town in the presidency of Madras, stands about 18 miles to the south of the Kistna or Krishna, and about 20 to the west of the Bay of Bengal, in lat. 16° 20' N., and long. 80° 30' E. It contains about 20,000 inhabitants; and though badly built and much overcrowded, it is yet understood to be a healthy place. The district of G. contains 4960 square miles, and 570,080 inhabitants.

GUNWALE, a term used on shipboard, rather vaguely, to designate the upper portion of the side of a ship or boat.

GURGAON, a district under the sub-presidency of the North-west Provinces, stretches in N. lat. from 28° 30' to 29° 30', and in E. long. from 76° 21' to 77° 35', containing 1942 square miles, and 460,926 inhabitants. Its chief town, which bears the same name, stands at the height of 817 feet above the sea. Its monthly temperature ranges between 60° F., the average of December, and 104°, the average of May.

GURGÉS, or GORGES, a charge in Heraldry, meant to represent a whirlpool. It takes up the whole field, and the face is borne proper, is a spur and argent.

GURGINA BALSAAM, a name of the balsamic liquid, also called Wood OIl, obtained from the Gurjun tree (Dipteryxorpus turbinatus). See DIPPERACLE and Wood Oil.

GURHWA, a protected state in India, lies between the Dehra-Doom and South-west Tibet, extending in N. lat. from 30° 2' to 31° 20', and in E. long. from 77° 5' to 79° 20'. It contains about 4500 square miles, and about 100,000 inhabitants. Being on the southern slope of the Himalayas, G. is little more than a mass of stumpy mountains whose elevation above the sea sometimes reach 25,000 feet. The crater of both the Junma and the Ganges, attracting, in spite of the length and ruggedness of the way, crowds of pilgrims to the peculiarly sacred localities of Jumnotri, Devprayagas, and Ganguotri.

GURNARD (Trigla), a genus of anachthopterous marine fishes of the family Scorpaenidae, containing a considerable number of species, some of which are common on the British coasts. The head in the gurnards is angular, and wholly covered with bony plates; the body is elongated, nearly round, and tapering; there are two dorsal fins; the pectoral fins are large; the teeth are small and numerous. Many of the gurnards are distinguished by beauty of colour. They are supposed to have received the name G. from the sound which they sometimes emit, particularly when newly taken out of the water, and which has obtained for one or two species the local name of Piper. A recent observer, M. Dufossé, ascribes the sound to the vibration of muscles with the air bladder, and has assigned to the notes produced by different species of gurnards their particular places in the musical scale. Most of the gurnards live generally near the bottom, and are caught either by the trawl-net or by hook and line, a shining piece of a sandeel being
a very captivating bait. Although not among the finest of fishes, they are good for the table. One of the most common British species is the Red G. (T. vulpinus or T. pilus); seldom more than 15 or 16 inches long and often of a greenish colour, the body marked

A Winter in the West Indies described to Familiar Letters to Henry Clay of Kentucky (1840).

GUSSET, a piece at first of chain, and afterwards of plate armour, intended as a protection to the vulnerable part of the arm where the elbow left a gap. —In heraldry, the gusset is enumerated as one of the abatements or marks of disgrace for unrighteous conduct. It is represented by a straight line extending diagonally from the dexter or sinister chief point one-third across the shield, and then descending perpendicularly to the base. Herals tell us that a gusset dexter indicated adultery; a gusset sinister, drunkenness; and when both were borne (as in the annulled example), it was because the bearer was guilty in both respects. Cowardice was indicated by an abatement called the gusset sinister (see GONN), which, though somewhat similar, we are told carefully to distinguish from the gusset, and which consists of two arches drawn one from the sinister chief, the other from the middle base of the escutcheon, meeting in the less point. A gorse like a gusset represents a detached part of a garnet; and according to Guillem. gorse and gussets 'are things in use among women, especially spinsters, and therefore are fit notes of cowards and womanish dispositions.'

GUSTA V'SIA, the chief town of the small Swedish island of St Bartholomew, in the West Indies, stands on its south-west coast, has a good harbour, and is said to have a population of 10,000.

GUSTAVUS I., king of Sweden—known in history as GUSTAVUS VASA, but designated before his accession to the throne by several other names—was born at Lindholm, in Sweden, on the 12th of May 1496, and died in 1560. As the descendant of an ancient Swedish family, which had given members to the national diet for nearly two hundred years, and which had been distinguished for hatred of, and opposition to Danish supremacy, G. was involved at an early age in the unfortunate quarrels and domestic wars which distracted Sweden at that period, and the first achievement of the future king was to take an active part in the defence made against Christian II. of Denmark, who, in 1517, in person commanded an assault upon Stockholm, the object of which was to compel the Swedish administrator, Svante Sture, and his senate to acknowledge him as king of Sweden. When famine compelled Christian to relinquish the siege, he had recourse to fraud; and having enticed a deputation from the senate, among whom was G., on board a ship, he set sail, and thus fraudulently carried his captives to Denmark, where G. spent a year in confinement in the custody of his maternal relative, Erich Baner, Lord of Kalloe, in Jutland. While under confinement, G. heard such alarming rumours of the expeditions which were preparing against Sweden, that, irritated beyond endurance, he broke his parole, and escaped in the disguise of a pilgrim, or, according to others, as a drover, and after encountering numerous dangers, reached Lubeck on September 1519. He arrived in Sweden with difficulty conveyed to Sweden, where he landed, in May 1520, near Calmar, the only place of note, except Stockholm, that still held out against the Danes. G. with difficulty made his way into the castle of the poet, and there he was with difficulty conveyed to Sweden, where he landed, in May 1520, near Calmar, the only place of note, except Stockholm, that still held out against the Danes. G. with difficulty made his way into the castle of the poet, and there he

GUSSET (Trigla pilus).
of the Danes was corroborated by the testimony of several fugitives from Stockholm, when a reaction followed, the national enthusiasm was roused, and the men of Dalecarlia, having called together a diet at Mora, proclaimed him head of their own and other communies of Sweden.

This was the turning-point in his life, for the peasantry now flocked around him from every side; and in forty years he lived, many of the strongest posts of the enemy had fallen into his hands, and he was able to enter upon the siege of Stockholm, which terminated in 1523, when Christian II. was compelled by his enraged subjects to resign the crown, and retire from Denmark. His forcible abdication brought the Scandinavian union to a sudden close, after it had existed for a period of 126 years; for when Frederick I., the successor of Christian, demanded his recognition in Sweden, conformably to the Union of Calmar, the Swedes declared at the diet of Strängnäs that they would have no other king but Gustavus Ericsson. But although G. was at once recognised as king, he was not crowned till two years later, in consequence of his unwillingness to receive the crown from the hands of the Romish bishops. The king early showed his determination to favour the Lutheran doctrines, and to cripple the power of the Romish clergy. He laid a large proportion of the heavy imposts raised to meet the expenses of the war; and although his opinions were for a long time not favourably received by the people, he finally succeeded in establishing the Reformation in the direct interest of his monarchy.

The disaffection of the peasantry, who threatened to destroy the nobility, and the imprudence of the Lutheran clergy, who tried to force the people to adopt Lutheran doctrines, combined to thwart many of G.'s schemes for the improvement of the country, while his latter years were disturbed and embittered by the jealousy and dissensions of his sons, Eric and John. Yet, notwithstanding these sources of dissension, G. effected more than any other Swedish monarch has ever done for the welfare of the people. He had found Sweden a wilderness, devoid of all cultivation, and a prey to the turbulence of the people and the rapacity of the nobles; and after forty years' rule, he left it a peaceful and civilised realm, with a full exchequer, and a well-organised army of 15,000 men, and a good fleet, which were both his creations. He protected home and abroad. Every province and trade received his attention and fostering care, and schools and colleges owed their revival, after the decay of the older Roman Catholic institutions, to him. He made commercial treaties with foreign nations, and established fairs for foreign traders. In his reign, roads and bridges were made in every part of the country, and canals begun, one of which has only recently been brought to completion. In his relations with his subjects, G. was firm, and sometimes severe, but seldom unjust, except in his dealings towards the Romish clergy, whom he despised with something like rapacity of all their lands and funds. He did much, however, to promote the cause of Lutheranism, although care that the reformed clergy should be dependent on the own, and enjoy only very moderate emoluments. To him the various tribes of Lapps were indebted for the diffusion of Christianity; and among them by a German missioner; while the Finns owed to him the first works of instruction, Bibles and hymn-books printed in their own language. G. was methodical, just, moral, and abstemious in his mode of life; an able administrator, and, with the exception of a tendency to various possessed few qualities that are unworthy of esteeem. He was three times married, and had ten children. The name of Vasa, which has been supposed to be an ancient patronymic in his family, but erroneously, since surname was not in use among the Swedish nobility until a later date, was adopted by him subsequently to his accession, and is conjectured by the historian Gojer (q. v.) and others to have been probably derived from his arms, which bore one G. Before the death of G., the time was short, and afterwards drawn like a vase, but changed by G. to yellow, from whence it came to be mistaken for a sheaf. By an act of the diet of 1544, at Westeraas, the crown was declared hereditary in the male descendants of G.; in consequence of which, his eldest son Eric (q. v.) succeeded to the throne on his death in 1560.

GUSTAVUS II. (ADOLPHUS) was born at Stockholm, December 9, 1594, and died in 1632 on the field of battle at Lützen. He was the grandson of Gustavus Vasa, by his youngest son, Charles IX., at whose death, in 1611, he succeeded to the throne of Sweden. G. had been strictly brought up in the Lutheran faith, and carefully trained in habits of business, and in the duties of one of the most active of the most active princes of his age. He was acquainted with eight languages, five of which he spoke and wrote fluently, was well read in the classics and ancient history, a proficient in mathematics, and a skilful warrior and other exercises. At his accession to power, he found the country deeply involved in wars abroad, and disorders at home, arising from the disputed succession of his father, who had been elected king on the exclusion of his nephew, Gustavus, king of Poland, the direct heir, whose profession of the Roman Catholic religion made him obnoxious to the Swedish people, and virtually annulled his claims to the crown. The first act of G. was to secure the hearty co-operation of the peasantry, and to make himself a powerful ally in the king of Denmark, and by thus established the foundation of an essentially feudal or military form of government, in which the nobles held their lands directly from the crown. He appointed a very effective tax, and made dependent upon the performance of military service to the crown, and thus laid the foundation of an essentially feudal or military form of government, in which the nobles held their lands directly from the crown. In addition to these two bodies, which had formerly constituted the national diet, G. for the first time admitted special delegates of the army into the council of the states, and thus extended the independence of the nobles. Having thus organised the internal government, he succeeded in levy heavy imposts and raising some companies of efficient troops, he inaugurated his military career by a war with Denmark, which at that time controlled the Baltic, the southern territories, and thus completely cut off the Swedes from direct communication with the continent of Eastern Europe. The war continued for a year, and terminated in a peace between the two countries, by which G. renounced his claims on the Lappish, districts and other disputed territory, and recovered possession, under certain conditions, of Calmar, Oland, Elfsborg, and the province of Gotenberg.

Having thus gained an outlet on the Baltic, G. secured a powerful ally in the king of Denmark, and concluded an alliance with the Netherlands. G. turned his attention to the Russian war, which, after fluctuating success, was concluded in 1617, by the treaty of Stolbova, by which Sweden obtained a temporary dominion over large parts of Karelia, and part of Liiland, while Russia recovered Novgorod and all other conquests made by the Swedes. The boundary of the Swedish territory, which then included the site of the future St. Petersburg, was marked, after the peace, by a stone which bore the three crowns of Sweden above a Latin inscription, recording that it marked the limits of the dominions of G. A., king of Sweden. The dispute with Poland still, however, remained undecided;
and, as he was turning aside, another in the back, which caused him to fall from his horse. The sight of the riderless animal spread dismay and fury among the Swedes; but before they could advance to his rescue, a party of Croats had thrown themselves between the king and his army; and it was not till many hours' hard fighting, and when the field was strewn with 10,000 dead and wounded, that they recovered the body of the king, which had been plundered and ravaged by the enemy, and availed nothing.

The artillery of the enemy fell into the hands of the Swedes, who remained masters of the field, after having fought with an impetuosity that nothing could resist. A rumour long prevailed that the shot in the back which caused the king to fall was from the hand of Albert Duke of Saxe-Lauenburg, but it appears that there was no just ground for the suspicion.

Although G. was eminently a warlike king, he made many salutary changes in the internal administration of his country, and devoted his short intervals of peace to the promotion of commerce and manufactures. He was pre-eminently religious, and his success in battle is perhaps to be attributed not only to a better example of the stricter discipline which he enforced, but also to the moral influence which his deep-seated piety and his personal character inspired among his soldiery. The spot where he fell on the field of Lützen was marked by the Šchneid-stein, or Swede's Stone, erected by his servant, Jacob Erichsson, on the night after the battle. Its place has now been taken by a noble monument erected to his memory by the German people on the occasion of the second centenary of the battle held in 1832.

GUSTAVUS III, king of Sweden, was born at Stockholm in 1746, and succeeded his father, Adolphus Frederick, in 1771, at a period when the country was distracted by the intrigues of the rival political parties of Horn and Gyllenborg, known as the 'Hats' and 'Caps.' Finding that the people, who were thoroughly wearied with the misrule of the nobles, were ready for any change, G. covertly fomented the general discontent, and having raised a fictitious rebellion, through the agency of his friend and adherent, Captain Hellichius, he collected together a large body of troops, on pretence of restoring order, having first caused the Senate to be dissolved, and being in a body, convoked the diet, and laid before it a newly framed constitution, to which the assembly was compelled to subscribe. A revolution was thus effected without the shedding of blood, and by a stroke of the pen (G. recovered all the royal powers that had been gradually lost by his immediate predecessors. G. acted with great moderation after this successful coup d'état; and he might have long retained the advantages he had gained, if his love of display, and his ways to emulate the king of France in extravagance and magnificence, had not led him into profuse expenditure, which embarrassed the finances; at the same time, the introduction of the manners and usages of Versailles at his own court irritated the national party, while it undoubtedly tended to demoralise the upper classes, and through them the nation generally. In 1788 he engaged in war with Russia, at the moment that the empire was engaged in a war with Austria, to which the French had been decisively rejected, the nobles, amongst whom he had many enemies, took advantage of his general unpopularity, and entered into a conspiracy against
GUSTAVUS IV.—GUTENBERG.

him, the leaders of which were Ribbing, Horn, and Pechlin. On the 16th March 1792, G. was mortally wounded by their agent, a Captain Ankar- sand, who fired a musket ball at the opera-house, which he had himself built. The pistol had been loaded with broken shot, which rendered the wound especially painful, and the king suffered the most dreadful agony for thirteen days before his death.

G. was a man of varied learning, and the author of several dramatic works and poems of considerable merit. His writings have been published in a collective form both in Swedish and French. In 1788, G. deposited certain papers in the library of Upsala, which excited much interest from the fact that they were not to be opened for fifty years after his death. Their publication, which was confided in 1842 to Gejer, disappointed the general expectation, as they were found to consist of historical notes and letters of little value.

GUSTAVUS IV., the son and successor of Gustavus III, was born November 1, 1778, proclaimed king March 29, 1792, and died in 1837. His uncle, Duke of Sudermania, acted as regent during his minority. The young king, on his accession to power, at once gave evidence of the high estimate at which he held the kingly power, and his first act was to join the third coalition against France, contrary to the wishes of his people. Hatred of Napoleon soon, however, became the guiding influence of his life. The result of his decided line of policy led to the occupation of Swedish Pomerania by French troops under Marshal Brune, who took Stralsund and Riga from the Swedes in 1807, and thus deprived them of the last of their German possessions. The king opened all his ports to English vessels, and thereby involved himself in a war with Russia. The scene of these hostilities was Finland, which the Swedes were obliged to give up to Russia at the close of 1808. Norway became next the scene of war, the Swedes being assisted by an English subsidy of 10,000 men, who, however, speedily returned to England when they found that G. intended to send them to Finland. The unfortunate war with Russia, which had been excited entirely through the folly of the king, gave rise to so much discontent in Sweden, that a conspiracy was set on foot by several officers and nobles, the object of which was to dethrone the unpopular monarch. The conspira-

tory, to procure the possession of the palace at Stock-
holm, and placed him under arrest; and after an ineffectual attempt at escape, he consented to abdicate the throne, 29th March 1809. After wandering for some time in place to place, he finally settled at St Gall, where he died, forgotten and in poverty, in 1837. His uncle, the Duke of Sudermania, after acting as regent of the kingdom, was finally proclaimed king, under the title of Charles XII., at the diet which met in May 1809. By the consent of the diet, Charles XIV. (Bernadotte) paid over the value of the private estates of the family of Vasa for the benefit of Gustavus and his children; but as the dethroned king refused to receive any of this money directly, or to accept the pension which the Swedish government had settled upon him, he was often in pecuniary difficulties, from which he was clandestinely relieved by his divorced queen and children, who observed, without his knowledge, to supply his wants.

GUSTROW, a town of Mecklenburg-Schwerin, and long the residence of the princes, is situated on the left bank of the Nebel, 27 miles south of Rostock. Among the principal buildings are the gymnasium, the old castle (now the workhouse), the fine Gothic cathedral, and the town-hall, whose former ramparts have been converted into pleasant gardens. G. carries on distillation and beer-brewing, and has several water-mills. Pop. 10,423.

GUT MANUFACTURE, an unpleasant though rather important branch of manufacture, the operations of which consist in preparing the membranes of animal intestines for various useful purposes. The French call it boyauderie, from boyaux, intestines, and have placed it under stringent legal regulations, on account of its offensive and pestiferous character. The guts are specially when considered in the quarter of a town, as at the Rue de la Boyauderie, in Paris. One branch of gut manufacture has been described under Goldbeaters' Skin. Cat-gut, as it is called, is made from the intestines of sheep, which are deprived of their fat by being pared by soaking and partial putrefaction, to loosen the different membranes of which the intestine is composed. These are then separated by scraping, then further soaked in clean water and scraped separately. After this, they are treated with a solution of potash, and drawn by women through a sort of thimble, and sorted for twisting into threads. They are then exposed to fumes of sulphuric acid, given off from burning sulphur, which decomposes the putrefaction. The small intestines are used for cat-gut, the large intestines are simply scraped and salted, for the use of sausage-makers and by confectioners, and for tying over preserved and pickle jars, &c. The twisted kinds of cat-gut strings are used for pulley and lathe bands, strings for archery-bows, drill-bows, hatters-bows, and other purposes where a strong cord subject to friction is required; the finer kinds are twisted into whip-cord, and are used for fishing-tackle and the strings of musical instruments. For the last purpose a very superior quality is required. The best, called Roman strings, are made chiefly at Milan. Our manufacturers have never been able to equal these, and this is attributed to the fact, that the Italian sheep are much leaner than ours, and the membranes of lean animals are tougher than those which are highly fattened and rapidly fed up to marketable size.

GUTENBERG, JOHANNES, or HENNE, whose name was GENFLIESCHL (LANSFLEISCH), and who is regarded by the Germans as the inventor of the art of employing movable types in printing, was born near the close of the 14th c. at Mainz. He was a man of some consequence, and was regarded as the name of Guttenberg in place of his districts from two estates in its possession. Of G.'s early life no particulars are known, but it seems probable that he devoted himself at an early age to mechanical arts. In the year 1425 he was living in Stralsburg, and in 1436, made a contract with And. Dryzehn, or Dritzen, and others, by which he bound himself to instruct them in all his 'secret and wonderful arts,' and to employ these for their common advantage. This undertaking, which comprised the first steps in the art of printing, was frustrated by the death of Dryzehn, more particularly as George Dryzehn, a brother of the deceased, commenced a lawsuit with G., which was decided against the former. And when and where the first attempts in the art of printing were made, cannot with certainty be ascertained, as the works printed by G. bear neither name nor date; this much is, however, certain—namely, that movable wood types were first employed by G. in the year 1438. In 1443, he returned from Stras-
burg to Mainz, where, in 1449 or 1450, he entered into partnership with Johannes Faust, or Fust, a wealthy goldsmith. Faust furnished the money required to set up a printing-press, in which the Latin Bible was printed for the first time. This
partnership was, however, dissolved after the lapse of a few years. Faust had made large advances, which G. was now to refund, but as he possessed neither the power nor the inclination, the matter was brought before a court of justice. The result was that Faust retained the printing-press, which he carried on and brought to perfection, in conjunction with Peter Schoffer of Germersheim. By the assistance of Conrad Hummer, a councillor of the Rhine, the young master of printing, as it is called, from which, in all probability, proceeded *Hermannii de Salisii Speculum Sacrorum*, printed in quarto without date or name. According to some, four editions of the *Donatiius* were likewise printed by G., whereas others ascribe the same to Faust and Schoffer. In 1457, appeared the Latin *Petriarum*, or rather a breviary containing psalms, with antiphons, collects, &c., and arranged for chasues for Sundays and holidays. This specimen of the art of printing, remarkable as being the first bearing the name of the printer and the locality, as well as the year and day of its completion, and valued by Dibdin at £10,000, was printed with an elegance which sufficiently proves the rapid progress that had been made in the newly invented art, and the diligence with which it had been prosecuted. G.'s printing establishment existed till 1465 in Mainz. He died, as is generally supposed, in 1461. He was a patron of the archbishop, Elector of Mainz, appointed him one of his courtiers, and raised him to the rank of a noble, though others place his death at the close of the previous year. The evidence in favour of G.'s being the inventor of printing, is confirmed by his countrymen quite conclusive. They ascribe the testimony of Ulrich Zell of Hanau, who first introduced the art into Cologne (1462), and who declares that 'this noble art was invented for the Rhine... by a citizen of Mainz, named John Gutenberg.' Similarly speaks Wimpeling, a learned Alsatian (born at Strasburg, 1451, and partly contemporary with Gutenberg). 'In the year 1440, under the reign of Frederick III., an almost divine benefit was conferred on mankind by John Gutenberg, who first discovered the art of printing.' So, too, Trithemus (born 1462, died 1516). 'At this epoch, this memorable art (viz., of printing) was devised and invented by Gutenberg, a citizen of Mainz;' while Johann Schöffer, son of Peter Schöffer (the partner of Faust), in his preface to a German translation of Livy (Mainz, 1556), expressly affirms that 'at Mainz originally the admirable art of printing was invented particularly by the ingenious Johann Gutenberg, 1450 A.D.,' and that it was 'subsequently improved and propagated to posterity by the wealth and labours of Johann Fust and Peter Schöffer.' That G. may have received the first hints of his invention from the Dutch xylography, is not denied. See Coster. Ulrich Zell himself admits this; but the invention of typography, and beyond all doubt of the printing-press, must be ascribed to the German.—Compare Oberlin's *Essai d'Annales de la Vie de Gutenberg* (Strasburg, 1801); Née de la Rochelle's *Eloge Historique de J. Gutenberg* (Paris, 1811); Gama's *Essai Historique de Gutenberg* (Paris, 1853); *L'Inventeur de l'Imprimerie* (Paris, 1853).

GUTHRIE, THOMAS, D.D., an eminent pulpit orator, philanthropist, and social reformer, was born in 1803 at Brechin, Forfarshire, where his father was a merchant and banker. He went through the curriculum of study prescribed by the Church of Scotland to candidates for the ministry at the university of Edinburgh, and devoted two additional winters to the study of chemistry, natural history, and anatomy. Meanwhile, he was licensed as a preacher by the presbytery of Brechin in 1825. He subsequently spent six months in Paris, studying comparative anatomy, chemistry, and natural philosophy. Returning to Scotland, he for two years conducted an evening system of education. He then accepted the superintendence of a bank agency in Brechin. In 1830, he became minister of Arbirlot, in his native county; and in 1837 was appointed one of the ministers presiding over the affairs of a bank agency in Brechin. In 1839, he became minister of Arbirlot, in his native county; and in 1843 was appointed one of the ministers presiding over the affairs of a bank agency in Brechin. In 1843, G. joined to time minister to a large and influential congregation in Edinburgh. In 1845—1846, he performed a great service to the Free Church, in his advocacy throughout the country of its scheme for providing manses or residences for its ministers. G.'s zeal, however, was not diverted into mere denominational or sectarian channels. He came forward, in 1817, as the advocate of Ragged Schools (q.v.); and to him the rapid extension of the system over the kingdom is very much due. He has also earnestly exerted himself, in many ways, in opposition to intemperance and other prevailing vices. G. possesses great rhetorical talent; and his style is remarkable for the abundance of the illustrations he uses. Few public speakers have ever blended solemnity and deep pathos so intimately with the humorous, his tendency to which has more frequently than anything else been pointed out as his fault. G. gets credit among all classes for liberality and catholicity of spirit, and displays a generous sympathy with all that tends to progress or improvement of any kind. He was moderator of the General Assembly of the Free Church of Scotland in May 1862. His most important published works are—*The Gospel in Ezekiel*, a series of Discourses (A. and C. Black, Edin. 1853); *Christ and the Inheritance of the Saints*, illustrated in a series of Discourses on St. Paul's Epistle to the Colossians (Edin. 1852); *The Way to Life*, a volume of sermons (Edin. 1862); *A Plea for Drunkards and against Drunkenness*, a pamphlet (Edin. 1856); *A Plea for Ragged Schools*, a pamphlet (Edin. 1847), followed by a second and a third plea, the latter under the title of *Seed-time and Harvest of Ragged Schools* (Edin. 1862); *The City*; its *Sins and Sorrows* (Edin. 1857). Perhaps it is in his *Pleas* that the most perfect published specimens of Dr G.'s eloquence are to be found.

GUTHRIE, WILLIAM, a political, historical, and miscellaneous writer, was born at Brechin, in Forfarshire, in 1708, and educated at King's College, Aberdeen. At an early period, he removed to London, where he worked hard for forty years as a man of letters. He died March 1776. Among his various works are a *History of England* (3 vols, Lond. 1744—1750); and *A Historical and Geographical Grammar* (1st edition, 1770; 24th edition, 1827); a useful manual of information, which enjoyed immense popularity in its time.

GUTS MUTHS, JOH. CHRISTOPH. FRIEDR., a German instructor of music, was born at Brechin, in Prussian Saxony, 9th August 1759, studied at Hallé, and subsequently became attached to Salzman's institution at Schnefenthal. There he gave himself specially to the elaboration, theoretical and practical, of Gymnastics (q.v.) as a branch of education; and from him it has passed into the curriculum of other German institutions. In 1793, G. published his *Gymnastik für die Jugend*, which has become a classic work on the subject, and the
The basis of all subsequent treatises. Besides several other works on his favourite subject, G. M. holds a distinguished place as a writer on geography. His centennial anniversary was celebrated August 9, 1859, at Schneppenthal, with great pomp.

**Gutta Percha (pronounced pertah),** a substance in many respects similar to caoutchouc, is the dried milky juice of a tree, *Isoquandira Gutta,* which is found in the peninsula of Malacca and the Malayan Archipelago. The tree belongs to the natural order *Sapotaceae.* It is a very large tree, the trunk being sometimes three feet in diameter, although it is of little use as a timber tree, the wood being spongy. The leaves are alternate, on long stalks, obovate-oblong, entire, somewhat leathery, green above, and the importation of gutta percha has increased amazingly; in 1860, it exceeded 16,000 cwts., but it has rather declined since, as its durability is found to be seriously affected by various causes, rendering it much less valuable than it was supposed to be. It has been used for making a vast variety of ornamental and useful articles; but its most important application has been the coating of marine electric telegraph cables. In this application, as in most others, its inherent defect, arising from the readiness with which it becomes oxidised and decomposed, is unfortunately manifesting itself seriously, and a substitute having greater stability is anxiously looked for.

Its great value arises from the ease with which it can be worked, and its being so complete a non-conductor of electricity. It softens in warm water, and can be moulded into any form in that state; as when soft it is not sticky, and turns well out of moulds. It will always be of great value as a material in which to take casts, as it can in the soft state be made to take the sharpest forms most faithfully, and as it quickly dries. It is hard, and preserves its shape excellently. It is too thin, the range of its utility in this respect is very extensive.

It is imported in blocks and lumps of five to ten pounds weight, in various forms, chiefly like large cakes, or oval pieces, into gourd-like vessels. It has a very light reddish-brown, or almost a flesh colour, is full of irregular pores elongated in the direction in which the mass has been kneaded. It has a work-like appearance when cut, and a peculiar cheese-like colour. Before it can be used, it has to undergo some preparation. This consists in slicing the lumps into thin shavings, which are placed in a distilling or tearing machine revolving in a trough of hot water. This reduces the shaving to exceedingly small pieces, which, by the agitation of the tearing-teeth, are washed free from many impurities, especially fragments of the bark of the tree, which, if not separated, would interfere with the compactness of its texture, which is one of its most important qualities. The small fragments, when sufficiently cleansed, are kneaded into masses which are rolled several times between heated cylinders, which press out any air or water, and render the mass uniform in texture. It is then rolled between heated steel rollers into sheets of various thickness for use, or is formed into rods, pipes for water, or speaking-tubes, and an endless number of other articles.

Gutta percha is often called chicle, or rubber, from caoutchouc or India-rubber in being non-elastic, or elastic only in a very small degree. Notwithstanding this very striking character of caoutchouc, the two articles are very often confounded in the public mind, probably from the similarity of their applications. It is most probable that India-rubber will eventually displace gutta percha in some of its most important applications, and especially in the coating of telegraph wires, to which purpose it has been successfully applied in America. There are two or three kinds of gutta percha known in commerce, and it is more than probable these are yielded by different species: that from Singapore is esteemed the best, and is distinguished by the Malay traders as *Gutta Tubera,* or *Gutta Tuber,* that of Borneo is a less valuable—this is called *Gutta Percha* by the traders, and has given the general name to all; and another kind goes by the name of *Gutta Gireh.* The first two are those generally known in our markets.

Gutta percha is turned by surgeons to various uses, chiefly for splints and covering moist applications to retard evaporation. A splint of gutta percha is made by taking a rigid board of the substance and applying it to the desired part of the body, soaking it in water, and then bandaging it to the limb. In a
GUTT ROSEA—GUTZLAFF.

few minutes the gutta percha is found hard, and
modelled to the shape of the parts. The cloth of
Gutta percha is sometimes used instead of oiled silk,
as it is about half the price; it is, however, apt to
wear, does not stand much heat, and is less flexible.
Gutta percha being readily soluble in chloroform,
such a solution is sometimes used for covering raw
surfaces, as when the chloroform evaporates it leaves
a pellicle of solid gutta percha. It has also been
used for stopping hollow teeth.

GUTTA ROSEA, a kind of cutaneous eruption
on the face, popularly called 'brandy blossoms,'
from its frequent occurrence in dissipated persons
advanced in life. It is an affection very difficult
of cure, and to be treated chiefly by a careful
regimen.

GUTTA SERENA, an old name for Amaurosis
(q. v.).

GUTT.E, pendent ornaments attached to the
underside of the Mutules (q. v.), and under the tri-
glyphs of the Doric order (see fig. under Column).
They are generally in the form of the frustum of a
cone, but rectanglur or rectangular, or even cymatial.
It is not clear what their origin may have been, whether, as
the name indicates, they represent drops of water or
crystals. Alberti calls them nails; and it does seem
likely that as many other parts of Greek architecture
have been shewn to be derived from structural
conditions (see Entablature), so those also should
close their origin to a similar cause. They have most
probably been derived from the wooden pins or
plugs, which were no doubt much more commonly
used than iron nails, and of which it is still common
to leave the ends projecting in any large wooden
structure, such as the centering of a bridge. What-
ever their origin, they were modified by the Greeks
into a graceful ornament.

GUTTÉ, or GUTTY, from the Latin gutta, a
drop, is said in heraldry of a field, or any particular
charge on the field, covered with drops. When
the drops are red, they are supposed to represent
drops of blood, and the bearing is said to be gutté de
sang. In this case, some great suffering or labour, such
as fighting for the recovery of the Holy Land, is indi-
cated. Where they are blue, again, they represent
tears, and the bearing is said to be gutté de larmes.
When white, they are called drops of water, and the
bearing is described as gutté de l'eau; but Nisbet is
of opinion that tears are intended in this case also
and that repentance or penitence is signified by both.

GUTTER, an open channel for conveying water
from buildings, roads, &c. Gutters are necessary for
the preservation of such structures, and have thus
been in use in all ages. The Greeks, who
constructed their roofs with a simple span, used
gutters at the eaves of their buildings, hollowed
out of the stone which formed the cornice. These
gutters discharged their contents on the ground at
intervals through small Gargoyles (q. v.), usually in
the shape of lions' heads. The Romans followed
this example, and also formed gutters with tiles
and in cement.

In the middle ages, the eaves seem to have been
left without gutters, until, owing to the castles being
frequently built on dry rocky sites, it was found
desirable to collect the rain-water and preserve it
in cisterns. Stone or wooden eaves, gutters, and
pipes were used for this purpose. In ecclesiastical
architecture, when the cornices were complicated,
it was necessary to convey the water from the roofs with great care, so as to prevent damage
to the building. It was collected at the eaves of
the central roof, and by means of well-projected
gargoyles, thrown along channels formed in the
crest of the buttresses, and so carried beyond the
walls of the building, and thrown off through
gargoyles in a number of small streams, which dispersed
the water before it reached the ground. This acted
well in calm weather, but during storms the water
was blown back all over the building, which, in case
of its being of a porous stone, softened and became
liable to decay. This led to the use of lead pipes,
which carried the water directly to the ground, and
discharged it into open gutters. At first, the pipes
were used for conveying the water from the main
roof to the roof of the side-chapels, whence it was
discharged by gargoyles. Pipes conveying the water
to the base of the building were also used in England,
where they seem to have come into use during the
14th century. They were then, with considerable
foresight, made square in form, not circular, as they
usually now are. The advantage of the former
section is, that in case of the water in the pipe
being frozen, there is room for the expanding ice
to swell out by slightly changing the form of the
square.

Pipes for conducting rain-water have the great
advantage of saving foot-passengers the annoyance
they meet with from the discharge of the water from
gargoyles; but the latter have the advantage of
being more easily inspected and kept in good order.
Whenever a gargoyle is choked, it shows the
accident by its awkward spouting; but a lead pipe
frequently bursts, and does much damage before
the leak is discovered. See SEWER.

GUTTFER.E, or CLUSIA/CER.E, a natural order
of exogenous plants, consisting of trees and
shrubs, natives of tropical countries, very generally
secreting an acid yellow resinous juice. A few
are epiphytes. The leaves are opposite, the fruit
of stipes, leathery, and entire. In botanical
characters, this order is allied to Hypericinum.
It contains about 150 known species, the greater part
of them South American, although all tropical
countries produce some. The resinous secretions
of some are valuable, particularly of those trees
which yield Gamboge (q. v.) and Tacamahaca (q. v.).
See also CLUSIA.—A few species afford valuable
timber. See CEPHYLLUM.—The flowers of some
are very fragrant; those of Menis ferrea are found
in a dried state in every bazaar in India, and are
used as a perfume.—The fruit of some is very
highly esteemed; the Mangosteen (q. v.) has been
described as the finest fruit in the world. The
Mamme Apple (q. v.) is another of the most
celebrated fruits of this order.

GUTZLAF, KARL, a missionary, was born at
Pyrzit, in Pomorania, 8th July 1803. At an early
age he was apprenticed to a felt-maker in Stettin.
Here he composed a poem, in which he expressed
his earnest wish to become a man of the cloth.
He went to Wittenberg, and in 1821, presented it to the king of
Prussia. The king caused him to be placed in the missionary
institute at Berlin. At the expiration
of two years, he was removed to the Dutch
missionary society at Rotterdam, and in August 1826 was sent to Sumatra. Being detained at Java, he fixed his residence at Batavia, where he devoted himself to the study of Chinees. At the end of two years, having acquired a considerable knowledge of the language, and familiarised himself with the habits of the Chinese residents in Batavia, he determined to give up his connection with the Dutch East India Company, and devote himself to the conversion of the Chinese. He joined Tomlin, the English missionary, and, in the summer of 1828, accompanied him to Siam. They settled at Bankok, the capital, partly for the purpose of preaching the gospel, partly to render themselves thoroughly acquainted with the Siamese language, and to perfect themselves in Chinese. For the sake of his health, he now, by the advice of a Chinese friend, went to Canton; and from this time, Macao became his principal station, and here he formed an intimate friendship with Robert Morrison. In conjunction with Medhurst and two other friends, G. began a new translation of the Bible into Chinese, with the assistance of Morrison. He founded a society for the diffusion of useful knowledge in China, published a Chinese monthly magazine, and preached at Macao and elsewhere. Compare his Voyage along the Coast of China in 1831, 1832, and 1833, with Notice of Siam, Corea, and the Loo-choo Islands. 

After the death of the elder Morrison, G. was appointed chief interpreter to the British superintendental government in China, with a salary of £500. In this capacity, he attempted, in May 1833, to penetrate into the interior of the province of Fo-kien, but without success. At the same time, the printing of Christian books in the Chinese language, and even of the distribution of Christian writings among the inhabitants of Canton, were prohibited. Thus restricted in his missionary career, G. joined the British during the war with the Chinese, and his thorough acquaintance with the Chinese rendered his services of great value; and he likewise contributed to bring about the peace in 1842. Finally, in 1844, he founded a Chinese society, for the purpose of diffusing the gospel, by means of native Chinese, in the interior of the country. To promote the design, he, in 1852, returned to Europe, and visited England, Germany, and other countries. He returned to China, landing at Hong-kong in January 1851, but died there, 9th August of that year. G. published various works, in different languages, some of which are extremely valuable: the principal are Geschichete des Chines. Reichs (Stuttg. 1847), and The Life of Taoksaung (Lond. 1851).

GUY, THOMAS, founder of Guy's Hospital, Southwark, London, was born at Horseleydown in 1644. He began business as a bookseller with a stock of about £200, dealing extensively in the importation of English Bibles from Holland (those printed at home being executed very badly); and, on this being discontinued in consequence of the University of Oxford for the privilege of printing Bibles, which he continued to do for many years. His principal gains, however, arose from the not very creditable profession of purchasing, during Queen Anne's wars, the prize-tickets of seamen at a large discount, and subsequently investing them in South Sea Company's stock, by which means he amassed a fortune of nearly half a million sterling. In 1707, he built and furnished three wards of St Thomas's Hospital. In building and endowing the hospital in Southwark which bears his name, he set apart £238,295, 16s. He was also a liberal benefactor to the Stationers' Company, and built and endowed alms-houses and a library at Tankworth. Besides making bequests to Christ's Hospital, and various other charities, he left £80,000 to be divided among those who could prove any degree of relationship to him. He was of mean appearance, with a melancholy expression of countenance, and during his whole lifetime had no other reputation than that of an intensely selfish andavaricious man. He died December 27, 1724, aged 80.

GUY'S HOSPITAL, founded by the preceding. In his 76th year, Thomas Guy leased from the president and governors of St Thomas's Hospital, a melancholy expression of countenance, and during his whole lifetime had no other reputation than that of an intensely selfish andavaricious man. He died December 27, 1724, aged 80.

In his 76th year, Thomas Guy leased from the president and governors of St Thomas's Hospital, a melancholy expression of countenance, and during his whole lifetime had no other reputation than that of an intensely selfish andavaricious man. He died December 27, 1724, aged 80.
for the comfort of the troops under his command, were the chief features in G.'s character.

GYSON, JEANNE BOUVIER DE LA MOTHER, well known as the Quisket Controversy, (see QUINTER), was born at Montargis in France, 13th April 1648. She had destined herself for the cloister, but at the earnest solicitation of her family married, at the age of 14, M. Guyon, a son of a rich and cultivated publican. But when she was 25, and still retaining her early religious leanings, she transferred her three children to the care of guards, settling on them almost all her property. Long thus entirely withdrawn from secular affairs, she attracted much notice by the high spirituality which her conversation breathed, and was invited by M. D'Arenthom, Bishop of Geneva, to settle in his diocese, where she formed the acquaintance of a Barnadite, Pere Lacome, then in much repute as a director of souls. The mystic doctrines which she learned from this ecclesiastic, and which involved such a degree of self-abnegation as to suppose that the truly Christian soul must become indifferent not only to life and death, but even to its own salvation or perdition, having come to the knowledge of the bishop, he withdrew his protection from Madame Guyon. In consequence she left Geneva, and accompanied by Pere Lacome, went to take up her residence in Italy and France, and eventually to Paris, where they drew about them a number of followers. The reputed extravagances of Madame G. led to her being shut up by a royal order in the convent of the Visitatoins, from which, however, she was set free, at the instance of Madame de Maintenon, and through this lady obtained entrance into the highest circles of Paris and Versailles. It was now that she formed the acquaintance of Fenelon, who was completely won over by her evidently sincere and captivated by the earnestness and lofty spirituality of her views. He failed to see the evil consequences which they involved; and the confiding zeal with which he defended her not only against the misrepresenations with which she was assailed, but even against the too well founded imputations which her principles had drawn upon her, was the cause of his unhappy rupture with Bossuet. See FENELON. Madame G. having submitted her writings to Bossuet and other members of a royal commission, subscribed 34 articles which were drawn up by them, and promised to abstain from all further speculation on these subjects. But she failed to keep her promise, and not only drew again upon herself the hostility of the court, but also became the object of much scandal on account of her intimacy with Pere Lacome. That the latter imputation was a calumny, it is impossible to doubt; but Madame G. was again put under arrest, and imprisoned first at Vincennes and Vangirard, and ultimately in the Bastile. She was liberated in 1702, and henceforward lived in comparative privacy till her death, which took place at Blois in 1717. She is the author of several works, the chief of which are Torrenta Spirituales, Moyen Court de Poire Oration, and Le Cantique des Cantiques interprèt. Siello le sens mystique, together with an Auto- biographical, Rural and Letters, as also many other spiritual poetry.

GUZEL-HISSAR. See ADIN.

GUYZERAT, a geographical division of India, stretches in N. lat. from 20° to 24° 45', and in E. long. from 69° to 74° 20', containing about 42,000 square miles and about 3,000,000 inhabitants. Its most important section, perhaps, is the peninsula of 8,000 square miles, lying between the Gulf of Cutch on the north-west and the Gulf of Cambay on the south-east. Of the mainland, a considerable portion is shut out from the sea by the British districts of Broach and Surat, so that the peninsula comprises nearly all the coast-line and most of the available harbours. With regard, however, to internal communications, the mainland has the advantage of the peninsula, being traversed, to say nothing of streams of inferior magnitude, by the Nerbudda and the Tapi. To the south of the last-mentioned river, G. presents the northern extremity of the Western Ghaut. Politically, the country belongs chiefly to the Guicowar, a protected prince under the presidency of Bombay. The agricultural productions of rice, wheat, barley, sugar, tobacco, castor-oil, maize, opium, cotton, and fruits. The cubbeher-bar, or great banian-tree, stands on an island in the Nerbudda, covering its secondary terrains, a thickly shaded area of several acres.

GWALLOR, the capital of the state of the same name in Central India, stands on a tributary of the Chumbul, towards the north-east of its singularly struggling territory, in lat. 26° 13' N., and long. 78° 15 E. It is on a completely isolated rock of about 300 feet in height, perpendicular, either naturally or artificially, on all sides; and as it measures 14 mile by 300 yards, it can accommodate a garrison of 15,000 men. It is thus virtually and essentially impregnable against attack, and the spot is understood to have been occupied as a stronghold for more than a thousand years, and the summit has been provided, from time to time, with several spacious tanks. Along the eastern base of this eminence of the town of G., containing little worthy of notice but a beautiful mausoleum of white sandstone; and to the south-west there extends for several miles the Lashkar, or camp of the Maharajah's troops. The approach, however, is on the north-east the Moorar, or cantonment of the protecting contingent. During the troubles of 1857 and 1858, the place attained an unenviable notoriety as a centre of rebellion, having, notwithstanding the fidelity of the Maharajah himself, been, for rather more than a year, in the power of the insurgents.

GWALLOR, the state above mentioned, with a remarkably irregular outline, and an area of only 33,119 square miles, stretches in N. lat. from 21° 8' to 25° 30', and in E. long. from 74° 45' to 95° 21'. Lying chiefly in the basin of the G., it is partly in the basins of the Nerbudda and the Tapi, it divides its drainage between the Bay of Bengal and the Arabian Sea. It has been roughly estimated to contain about 54 millions of inhabitants. Though G. is a Maharajah principality, being, in fact, the principal fragment of the great empire of the Peishwa, yet it is only to the south of the Nerbudda that the Maharattas form any considerable proportion of the people. Under such circumstances, therefore, the dominant race can maintain its supremacy by force alone. Since 1803, the country has been under British protection. The existing relations of the two parties, however, date only from 1844. In 1845, the death of the Maharajah, whose heirs are still under British protection, gave rise to an universal anarchy, led to the forcible interposition of the British government; and by the treaty of the following January, in addition to a large contingent under British authority, the native government was permitted to have 9000 troops force. During the troubles of 1857, the new Maharajah, not more than 22 years old, remained faithful to the English, notwithstanding the almost entire defection of both divisions of the military force.

GWYNIAD. (Coregnum Penmanii, or the British species of the Cubbeher bar, or the G. stands amongst the largest of their form, the large size of their scales, and their silvery appearance, are sometimes called Freshwater Herring,
and are vulgarly identified with the herring. The general similarity is in this case very great. The G., when full grown, is about ten or twelve inches in length; the first dorsal fin is high; the snout is a little produced; the mouth is small, the jaws without teeth, a few minute teeth on the tongue only. It is found in some of the lakes of Wales and Cumberland. G. is a Welsh name. At Ullswater, the fish is called Schelly. It occurs in that lake in great shoals, so that many hundreds are sometimes taken at a single draught of the net. It is rather an insipid fish, and cannot be kept long after being taken out of the water, unless salted, which it often is by the poor. The Freshwater Herring of Loch Lomond is not the G., but the Pownan. Many of the species of this genus, however, very nearly resemble each other, and are not easily distinguished by more description.

GYRING, or GIBING, in sailing with fore-and-aft sails, the act of going about, when the wind is astern or at any point aft the beam, so that the wind may be brought to bear on the sail on the reverse side of the vessel to that in which it was felt previously to the operation. Gybing is the opposite to tacking, which can only be performed when the wind is before the beam.

GYGES, a Lydian, about whose early life little is known. Nyasia, wife of Candaules, king of Lydia, having been gravely affronted by her husband in presence of G., ordered the latter, who was in high favour with his sovereign, either to slay Candaules or to prepare for his own fate. (Compare the history of Rosamund, wife of Albin, king of the Lions.) G. accordingly put his master to death, married Nyasia, and assumed the supreme power, about 716 B.C. The Lydians, however, refused to acknowledge his authority, until the oracle of Delphi declared in his favour. In return for this service, he made immense presents to the sacred shrine. He is said to have reigned 38 years, and to have amassed enormous wealth, so as to give origin to the proverb, 'the riches of Gyges.' The successors of G. were Arlys, Sadyattes, Alyattes, and Croesus, who was defeated by Cyrus the Great in 546 B.C. (or 548). The Lydian empire was thus overthrown. Plato has a fable, in which G. is represented as a shepherd of Candaules; but having miraculously obtained possession of a golden ring of great virtue, he was enabled by means of it to make himself invisible when he chose, and thus took occasion to murder his sovereign, and usurp the supreme power. The ring of G. is frequently mentioned in the middle ages.—Gyges is also the name of the hundred-handed giant, son of Cetus and Tera, who with his brothers made war on the gods, and after his overthrow, was subjected to everlasting punishment in Tartarus.

GYMNASIUM. This word (from gymnos, naked) was applied to those public places or buildings where the Greek youths exercised themselves. In ancient Greece, there were several sorts of this kind. Philosophers also gave instruction in these gymnasia, hence the transference of the name to public buildings erected for the mental disciplining and instruction of youth. The German gymnasia, however, correspond roughly to the grammar and public schools of England, and the grammar and high schools of Scotland. All three had their origin in the cathedral and monastery schools of the pre-reformation period. The widening circle of human knowledge in the 17th and 18th centuries made itself felt in these educational seminaries, as in the universities. Their curriculum became gradually extended, and with the further increase and development of universities, their aim became higher. In Germany, as in this country, the classical tongues formed and continue to form the great instrument of mental discipline in schools of this higher class, though other subjects have been added from time to time. The subjects of instruction which were first added to the classical tongues were geography and history. The natural sciences and mathematics, the pursuit of which has formed a characteristic feature of this century, gained a place in these schools, and the study of the mother-tongue and of modern languages was also admitted. For a time, these subjects held a co-ordinate place with Latin and Greek. Departmental studies were taught with splendour, and the intellects were sapped of the resources which would flow from early initiation into the results and processes of the various sciences. These anticipations having been somewhat disappointed, there has for some time been a steady movement towards the formation of classical or gymnastic studies to be the main instrument of education, while retaining other subjects as a subordinate portion of the curriculum. The idea, however, of the gymnasium as a preparatory school for the university, and therefore not suited to all classes indiscriminately, has been more steadily kept in view in Germany than in Great Britain, and the consequence has been the breaking up of the middle school or gymnium into two— the gymnasium proper, where those are taught who propose to enter the universities, or who desire a partial classical training; and real-schools, where elementary science, foreign languages, and mathematics form the principal subject of instruction. In this respect, the middle-school education of Germany affords a favourable contrast to that of England. It is not to be supposed, however, that in England the grammar and public schools are less efficient in their classical training; the contrary is probably the fact, so far as our principal schools, such as Eton, Harrow, and Rugby, are concerned; but the methodised system of examinations, and the more rigorous methods of Germany, seem to turn out a larger proportion of well-instructed boys from each school, while the influence of central authority secures greater uniformity of processes and results throughout the country. The boys attend, as in England, till they reach the age of 18, when they either take a special examination (the abiturient or maturity examination), they are transferred to the university. The German gymnasia differ from English public schools for the middle and higher classes in being day-schools, not the centres of great religious establishments. In this respect they resemble the Scotch grammar and high schools.

GYMNASTICS (see GYMNASIUM), a term, in its more restricted and proper sense, applied to those exercises, not amounting in intricacy to games, in which particular limbs, either singly or in combination, are rendered more pliant or stronger:
GYMNEMA—GYMNTRUS.

these exercises are arranged in a due progression, and the entire series becomes a system under the same gymnastics. Swimming (q. v.), Boating, and games like Golf (q. v.), Cricket (q. v.), &c., are among the most efficient gymnastic exercises; but in this article attention will be confined to exercises whose primary and direct aim is muscular development and health.

Gymnastic exercises are so old as to be pre-historic; they are included in the 2d and 23d books of the Iliad. Before the time of Hippocrates, gymnastic exercises had been adopted in Greece as part of the course of medicine intended to counteract increasing luxury and indolence. The various exercises were speedily combined into a system—called gymnasium, where they should be carried out, were formed first by the Lacedaemonians, and subsequently at Athens. See GYMNASIUM. The Romans adopted the system, and it is only from the earliest portion of the present century that the science has at all revived.

The revival commenced in Prussia, where, about 1860, gymnasia were opened by Basedow and Salzmann, that of the latter being under the superintendence of the celebrated gymnastic pedagogue Gymnastics (q. v.). Jahn followed in the same line, and rendered the science so popular, that it speedily attracted the attention of the youth throughout the kingdom, and to the training thus obtained must be attributed in no small degree, the vigour which succeeded in driving out the French army of the first empire. Sweden soon imitated Prussia, and from that time gymnastics has formed a prominent feature in the Scandinavian course of education. In Prussia, the gymnasium began to be the scenes of political gatherings, too liberal in tendency to please its semi-military government; and in 1818, they were all closed. The troops were, however, continued in gymnastic exercises, and showed so clearly the advantages of the training they experienced, that, about 1844, Louis Philippo adopted and improved the system in the French army. From that time, gymnasia have been constructed for almost all continental armies, and, with more or less success, for the civil population. England, last ordinarily in public improvements, is but just moving in the matter by establishing instruction in the science at Aldershot and other camps; in private life, however, there have long been many excellent gymnasiums.

Diff'rent instructors adopt various systems of instruction. The course passed through in the French army is, however, one among the best, as its fruits evince, in the remarkable activity and readiness for emergency displayed by the soldiers who have undergone it. The equipment consists of a broad belt, to be strapped tightly round the waist above the hips, as a support to the body in the arduous motions to ensue, braces being of course discarded. The implements most commonly used are an iron ball in a rope sling, with a loop for the hand to pass through; wrestling-handles, consisting of two wooden bars, each about 18 inches long, connected by stout cordage; a club; leaping-bars, to be leaped over; and leaping-poles whereon to leap.

The system of instruction is divided into a number of "courses" regularly graduated, beginning with elements and simple exercises, with an aim to render every part of the body supple, and to develop the several muscles and give complete command over all their motions (elementary gymnastics); and finally to be followed by leaping, suspension, standing and walking on beams, walking on stilts, climbing, swinging, vaulting, &c. (applied gymnastics).

The theory of the advantage derivable from gymnastics is simple enough: and as a law of nature provides that—within certain limits—parts of the human frame increase in strength, aptitude, and size, in proportion to the use made of them. In gymnastics, this law is brought to bear successively on every part, and finally, the whole system in combined action. If the exertion be not carried so far as to induce excessive fatigue, all other parts of the body sympathise with the improving condition of that which is mainly exerted; the circulation excited and the muscles decreased, and finally vanished altogether. To make infantry soldiers perfect in the drilled movements of masses, cavalry good horsemen and fair swordsmen, and to have gymnasts who could take and return a word as they utmost sought by the possessors of great armies; while the science of gymnastics, having gone out of repute for the military, was speedily neglected in merely civil life.

GYMNEMA. See Cow Plant.

GYMNTRUS, genus of acanthopterygian fishes of the Ribbon-fish (q. v.) family, having the body much elongated, and at the same time attenuated and compressed, the dorsal fin extending the whole length of the back, the ventral fins consisting only of a single long ray, often dilated at the end; the mouth small. The fishes of this genus are inhabitants of great depths, and are rarely taken or thrown ashore. *G. remifera* is a native of northern seas; *G. Haustenii* has occurred on the coast of Britain.
GYMNOCLADUS—GYPSIES.

Other species are tropical. It has been supposed that large fishes of this genus may have given rise to some of the stories of the Great Sea Serpent. One was lately captured at the Bermudias, apparently an immature fish, but more than 16 feet in length, and with a row of long flexible filaments on the back of the head and anterior part of the back, which might well represent the mane often ascribed to the Sea Serpent. A specimen of G. Hawkinsi, caught

Gymnus Hawkinsii.

on the coast of Northumberland, was exhibited in London at the time when the subject of the Great Sea Serpent excited greatest interest, and was by many supposed to explain the accounts of it.

Gymnocladus, a genus of trees of the natural order Leguminosae, sub-order Canellipinheae.—G. Canadensis is a North American tree, found both in Canada and over a great part of the United States, attaining a height of 50–60 feet, with branches remarkable for their upright direction, and an exceedingly rough bark which comes off in slips. The leaves of young trees are very large, three feet long, bipinnate. The flowers are white in short spikes. The pods are five inches long by two broad. The tree is called Chico in Canada, and sometimes Stamp Tree, from its dead appearance in winter, and the abundance of conspicuous buds. It is also called the Kentucky Coffee Tree, because the seeds were formerly roasted and ground as coffee in Kentucky. It grows well in Britain. The wood is used both by cabinet-makers and by carpenters. It has very little sapwood. The pods, preserved like those of the tamarind, are said to be wholesome and slightly aperient.

Gynogenes, in the botanical system of Lindley, are those plants with exogenous stems and perfectly naked seeds. He divided them into a separate class, of which Coniferæ, Taxoneae, Cycadeæ, and Gnetaceæ are the orders. They are remarkable for the large apparent perforations or disks in the vessels of the wood, but they have concentric zones, spiral vessels, and a central pith, like other exogenous plants. Their great peculiarity, however, are the total absence of a pericarp, and that fertilisation takes place directly through the foramen of the ovule, without the intervention of style or stigma.

Gymnosomata (Gr. naked-bodied), an order of Pteropodimæ (q.v.) molluses, destitute of shell, having a distinct head, and swimming by fins attached to the sides of the neck. They are all marine. The Clio borealis of the arctic seas (see Clio) is the best known and most interesting example.

Gymnosophists (i.e., 'naked sage'), the name given by the Greeks to those ancient Hindu philosophers who lived solitary in the woods, wore little or no clothing, and addicted themselves to mystical contemplation and the practice of the most rigorous asceticism. Strabo divides them into Brahmins and Samans, the former of whom adhered to the strictest principles of caste, while the latter

admitted any one into their number regarding whose character and kindred they were satisfied.

Gymnotus, a genus of malacocephous fishes, of which only one species is known, the celebrated G. electricus, or Electrical Eel. This genus gives its name to a family, Gymnotidae, of which, however, no other known species has any electrical powers. The Gymnotidae are mostly South American, inhabiting the fresh waters of the tropical regions. They are eel-like in form, and like eels are destitute of ventral fins (upolat), but they are furnished with complete jaws and with ribs, and their fin-rays are jointed or branched. They have pectoral fins, but no dorsal; the anal fin is largely developed, extending either to the point of the tail, as in the electrical eel, or leaving it free. The electrical eel has the skin entirely soft, and destitute of scales. It is very widely diffused over the warm parts of America, and is found both in streams and pools. Its electrical apparatus and powers are described in the article ELECTRICITY. Animal. It is capable of being tamed, and when familiar, will allow itself to be handled without giving a shock, but employs its electrical powers both in order to kill prey and to

Electrical Eel (Gymnotus electricus).

defend itself from assailants, most frequently, perhaps, alligators. All the Gymnotidae are remarkable for the position of the anus, which is so very far forward as in the electrical eel to be before the gill-openings, whilst in some of the other fishes of this family it is even before the eyes. Some fishes of this family have an elongated snout. The electrical eel, however, has a rounder and more obtuse nose than the common eel.

Gyneryum. See POMPAS GRASS.

Gyöngyös, a town of Hungary, in the county of Heves, is situated at the southern base of the Matra Mountains, about 60 miles north-east of Pest. The last declivities of the Matra Mountains produce an excellent red wine called by the Germans Erlauer, and very like Burgundy, for which, indeed, it is often mistaken. G. has a gymnasia, manufactures woollen fabrics, and carries on trade in wine and fruit. Pop. 15,000.

Gyproperos. See LAMMERKIERER.

Gypsies (Egyptians), [Fr. Bohémien; Germ. Zigeuner; Dutch, Heethans; Dan. og Swez. Tatara; Ital. Zingari; Span. Gitano, Zocelca; Hung. Csí- jányek, Pharronpék; Pers. Shek; Hind. Karache; Arab. Harami; Gyps. Rom (man), Sinte (from Indi), Calo (black); nicknamed in Fr. Cogoux, Grouz; Germ. Zieh-Gauner, &c.], a mysterious vagabond race, scattered over the whole of Europe and parts of Asia and Africa. Whence they originally came, and what were the motives which drove them from their native soil, are questions which, after having
Gypsies.

passed through a long stage of helplessly absurd speculation, have of late years been ventilated by competent investigators, both linguists and historians, and are still but partially solved. So much only seems now established, that India, the cradle of many nations, was also the source from which they sprang. Whether, however, they are the Telshandals of which the laws of Menou speak, or the kinsmen of the Bazeegars or Nuts of Calculutta; whether in Spain, Italy, or the Persian Gulf, or near the mouth of the Indus, or are the descendants of those Luria—identical, according to Persian and Arabic authorities, with the Zuitt or Biuts of Northern India, by whom the Eun.jw., as having been called into Persia by Bahram Gur to the number of 10,000, about 420 A.D., that they might act as musicians to the poor—cannot be affirmed with certainty, although there can be no doubt that they represent in some degree of the larger emigrations in the 14th century. The first notice of them which occurs in European literature is embodied in a free paraphrase, in German, of the Book of Genesis, written by an Austrian monk about 1250, in which he refers to the race, then as now, as the descendants of that poor and obscure tribe of India. The first considerable body left Asia for Europe before the 12th c., perhaps in consequence of disastrous encounters with the Arabian conquerors; and Tamerlane was supposed to have dispersed them again recently, with their earlier brethren, described by the monk. And with the reckless brutality characteristic of the middle ages, edict after edict was hurled against these 'diviners and wicked heathens.' The governments of other lands in Europe vied with each other in pursuit of them, and slaying them whenever and wherever found, and in most severely punishing those that dared to shelter them, chiefly 'because of their traffic with the devil.' These edicts remained in force in many countries down to the 16th century. In 1624, James I., in the Great, in 1748, renewed the law that every Gypsy beyond the age of 18, found in his states, should be hanged forthwith. In England, the most barbarous decrees against them were issued by Mary VIII. in 1531 and Elizabeth in 1563. In Scotland, where, under James V., a certain Johnny Faa had been officially recognised by the crown as Lord and Count of Little Egypt, some of the severest edicts date from 1570, 1663, and 1669; and in 1624, Reu. Faa, a descendant of Johnny, together with fifteen other women of the seed-royal, were condemned to be drowned. Towards the latter half of last century, however, more humane measures were adopted towards them, with a view to the improvement of their social and moral state. Maria Theresa, in 1768 and 1773, issued ordinances for the education of their children, and their gradual settlement as cultivators of the soil, chiefly in Hungary and Transylvania, where they thrived and increased in numbers; special streets were built for them at the ends of the villages, and the name of Uj-Magyar, Uj-Parasztok (New Peasants), was officially bestowed upon them. Joseph II., renewed these edicts in 1782, with certain modifications. Various other methods of gradually amalgamating them with the general population were tried elsewhere (a society was formed for that purpose at Southampton by the Rev. Mr. Crabbe in 1832), but with comparatively little effect. They have continued—with few exceptions—their peculiar nomad life, with all its questionable resources and practices, its joys and its sorrows, unchanged, up to this day; and even the most enlightened among their chief are confounded with the childlike sports and amusements of the gypsy children, the children of the Gypsies. In the midst of Christian families, have driven by some mysterious and uncontrollable impulse, run away from their civilised homes as soon as a favourable opportunity offered.

Before proceeding to give a general outline of their present condition, we must briefly mention what have been the opinions held about them since the 15th c. by the learned. They have been, then, by turns set down as Egyptians, Nubians, Tartars, and

* Ishmaelites— a notion perpetuated in the designation Geschmaelen of the Danish thieves' jargon, and the German Rodeklerch (Dorphy, 44 and 45; Grolman, 65)— a term which has here prevailed, all through this time, years, during which they were not to sleep in a bed. At the end of this period, they would be sent to a fine and fertile land. Yet another account was, that they were commanded by God to roam through the world for that period, in expiation of their want of hospitality towards Joseph and Mary—a notion which has, curiously enough, been partly revived in our own day by Roberts, with this difference only that he proves them, from the prophecies of Isaiah, Jeremiah, and Ezekiel, to be the descendants of the ancient Egyptians, and their wanderings to be the predicted punishment of the various iniquities of their forefathers.

At first, they were well received. The romance with which they surrounded themselves, their pretended degree of penitence, above all, the pomp and wealth they displayed, were sufficient to secure the good-will of the countries through which they passed—so much so, that letters of safe-conduct were given them by the Emperor Sigismund, the genuine-
Gypsies

Orientalists, Mesopotamians, Assyrians, Ethiopians, Moors, Armenians, Manicheans, Banditti, and German Jews. More recently, they were, on account of the name of Zingari or Zingani—probably a corruption from their own name Buzist (from Ind), by which they are known in many countries of Europe—brought in connection with the Sigynnai, a people of Median origin, settled on the Danube, mentioned by Herodotus; with the Sigynni of Strabo, in the Caucasus. It is said that their origin is lost, and of other tribes known and unknown. Again, their name has been derived from one Zinganeus, who, in 1517, when they had long been known as Zingani, fled with his followers to escape the vengeance of Selim. The now recognised theory of their Indian origin, proved incontestably by their language, was first positively advanced by Rüdiger in 1782; and in his track followed, with more or less success—collecting, comparing, or arranging new and old linguistic materials—Greßmann, Alter, Seatzen, Pottinger, Hovland, Puchmayer, Ouseley, Danilowicz, Bischoff, Domény de Rienzi, Graßunder, Borrow, Richardson, Bishop Herver, and many others. The result, the conclusion arrived at by Professor Pott of Halle, whose ZungenSprache (1844—1845) is the most wonderfully thorough and exhaustive book ever written on this subject of gypsies and their language. The language, which, then—a daughter of the old Sanscrit—has, besides giving the only real clue to their origin, also shed some rays over the dark period between their first emigration and their appearance in Europe, originated the distinct mode of speech of a single and special border tribe of Northern India, it has, during the many wanderings of the race, appropriated words from every country through which it passed; while, on the other hand, it lost many of its own words, and still more of its own inherent power and elegance, and much also of its resemblance to its mother and sisters. These adopted foreign words, their respective number, and their more or less corrupted state, point plainly to the gypsies having first passed into Persia, to their having remained there for a considerable time, to their having then wended their way to some Greek country, perhaps Asia Minor (the designations for 7, 8, and 9 being Greek), and to their descent thence into Hungary, Cyprus, &c.

But their language also (Romany Tschib), though split into different dialects, has also remained almost intact. It has been said that the whole scattered nomadic gypsy members together. Those of their branches who for centuries have had no intercourse with each other, would, although the strange elements in the other's speech would be incomprehensible to them, yet recognise each other at once by certain words and formulas indelibly written in the memory of the whole race. The outward appearance of the gypsies, who have been pronounced by competent writers to be one of the handsomest races of humanity, varies in some degree according to the climate under which they are born and in which they roam. Their chief characteristics, however, remain everywhere the same: tawnyness of skin; slightly projecting, but agreeably formed cheek-bones: long, black eyes, exquisitely shaped mouth, ruddy lips, teeth of a dazzling whiteness, slenderness and agility of limb, expressive features, and well-proportioned, often beautiful, bodies. Their garments are, indeed, exquisitely beautiful when young, but they lose their good-looks at a very early period, partly on account of the squarer of their habits, and partly through the unsettled and precautious life. Like children, they are fond of showy colours in dress, and do not disdain to adorn themselves with even dubious trinkets and fine garments in a forward state of decay; but they always arrange their clothes, however poor, with great taste. Of their other qualities, their manners and customs, we can only say that they were, and still are, supposed to be cowardly, revengeful, and treacherous; that they allow themselves to be used as spies, are the associates of robbers and thieves, and of questioners of questionable trades; the wearers of very fine clothing, the keepers of questionable horses, and acting as go-between. It is further said that their language has no word for God, immortality, soul—that, in fact, they have none of our superstitions. Whatever; that their marriages, contracted very early, are not binding; that they were, or are, wont to eat their parents; and that they are altogether a very criminal race. How much of these charges is more founded on fact than their intercourse with demons, for which they have been so dastardly slaughtered in former days, we are not able to decide; certain it is, however, that their ethical code differs most essentially from that of other races. They are, on the whole, honest, and the envy of all nations. They are very fond of their childhood credulity and brutal cruelty. They have proved themselves, on several occasions, bold and courageous as lions, but they prefer running away to fighting the battles of the weighty; and it is agreed on all hands, that they are passionately attached to their relations; that they arefatalists, and have a sort of fetichism or pantheism, though its peculiar form has never been revealed to us by our inquisitive travelers. At the same time, they belong outwardly to the religion of every country which they happen to inhabit, and repeat the process of baptism as often as they can, with a view, as some have it, to the presents of godfathers and godmothers. Whatever; they believe in a metempsychosis or transmigration of souls, and refrain for that reason from eating certain animals (eels, &c.), although, generally, they are anything but choice in their food. They are dirty, lazy, fond of drinking and smoking, and the talent for music is remarkable in the extreme; their ears seize, and their instruments reproduce, after the first hearing, the most difficult and complicated pieces, as ad libitum, with ease. Many famous artists (Kecskeméthy, Bunks, &c.) have issued from their ranks: and their own melodies sounding over the whole Hungarian plains, the steppes of Russia, or through the streets of Jassy, are not to be considered as easily forgetting. Having no national customs, the gypsies are amongst the most industrious, having not a single object of question. The increase of population, and the growth of
culture all over Europe, are their worst enemies. Their forests are cut down, their heaths enclosed, the houses are pushed right into their commons; and the easy and remunerative belief in their secret arts is waning more and more. It is doubtful, indeed, whether they will, as a separate race, survive many more centuries in Europe. Their numbers at this moment are stated so very differently, that we would fain caution the reader against an implicit belief in the figure by which we extract from the comparatively most reliable authorities: in Hungary, 140,000; in Transylvania and the Principalities, 162,000; Spain, 40,000; England and Scotland, 18,000 (their chief families in these countries being the Royal, Less, the Stanleys, Coopers, Horse, Smiths, Lovells, &c.); Poland, 200; Russia, 10,000; Germany, France, and Italy, 40,000; Norway, 1,500. Altogether, including those in Turkey and in Asia and Africa (their sojourn in Mexico is questionable), they are computed at about five millions (Riccanz). A small portion only of these occupies a body fixed habitations in Hungary and Transylvania, where they are agriculturists and gold-washers; and there, in the towns and villages, where they live in a kind of servitude, and are divided into four different classes—Rudari or Aurari (gold-seekers), Usarri (bear-leaders), Linguri (manufacturers of and dealers in wooden spoons, mouse-traps, &c.) and Alabaster, small farmers, smiths, &c., depending on the materials, which would lead a rambling life, live in kennels and under tents from one end of the year to the other, gaining their scanty livelihood, like their forefathers, as best they can, fearing and detesting nothing so much as a fixed and confining occupation, which would take them away from 'their free mountains, their plains and woods, the sun, the stars, and the winds.'

The following is a specimen of their language in the form of a short improvised stanza:

Porquel ichipen abajo
Abilllela un balichoró,
Abilllela á goli goli,
Ustilam Carloró.

There runs a swine down yonder hill
As fast as e'er he can,
And as he runs, he crieth still:
'Come steal me, gypsy man.'

GYPSUM—GYR-FALCON.

GYPSUM, a mineral consisting essentially of sulphate of lime and water, the proportions of its constituents being lime, 32.56; sulphuric acid, 46.51; water, 20.93. It is very widely diffused, occurs in great abundance in many parts of the world, and is found in rocks and strata geologically very different, as in transition rocks, in secondary and in tertiary formations. It often occurs in nests or kidney-shaped masses in clay or marl. It is found above chalk in many places, and large quantities of it are quarried in some parts of England from the red marl immediately above the great bed of rock-salt. It sometimes occurs in beds many feet thick. It is transparent or opaque, white, yellowish-white or gray, or even yellow, red, brown, or black, according to its purity of chemical composition or the quantity and nature of impurities present. It is also compact, fibrous, foliated, or earthy; sometimes crystallised in six-sided prisms or in lenses. Twin crystals are frequent. It is easily broken, scratched, and cut. Before the blow-pipe, it becomes opaque, if not already so, and fuses into a white enamel. The water which it contains is driven off by a heat of about 272° F., and it is then easily reduced to powder, in which state it is well known as Plaster of Paris. Unburned G. is tough, and not easily reduced to powder. G. is soluble in cold water, to the extent of about one part in 461, and is a frequent ingredient in the water of springs; it is scarcely more soluble in boiling water or in acids. To this solubility in water, although so slight, must be ascribed the value of G. as a manure; the further chemical examination of which, however, still remains to be ascertained, although theories have been proposed by Sir Humphry Davy and Liebig, the former supposing the G. to act chiefly by itself, becoming the nutrient of the crops to which it is most beneficially applied; the latter supposing it to act chiefly by fixing the ammonia of the atmosphere and conveying it to their roots. As a manure, G. is more extensively used in some parts of the continent of Europe and of North America than of Britain. In North America, it is reduced to a fine powder by mills, in order to be used as a manure, for much of its value depends on the fineness of trituration. To clover crops, the application of G. is particularly beneficial, and although it does not produce much benefit in its direct application to grain crops, yet in an alternation of wheat and clover, the crop of wheat is larger because of the liberal supply of this mineral manure to the clover. An excess of G., however, is prejudicial, as has been found in some parts of England, where the subsoil containing it in great quantity has been rashly brought up by the plough.—G., deprived of its water by burning, and reduced to powder, forms a paste which, when mixed with its own bulk of water, produces the great use of Plaster of Paris for making casts and cornices. But if the G. is burned at too great a heat, it refuses to set, and the powder of the mineral called Akabédée, which is an anhydrous sulphate of lime, has not the property of setting.—One of the finest varieties of uncrystallised and untransparent G. is Alabaster (q. v.—Satía Spar is a beautiful fibrous variety of G., exhibiting a fine play of light, and employed for ornamental inlay-work, and other ornamental purposes, but having the disadvantage of being easily scratched.

GYRATION, CENTRE OF. See CENTRE OF

GYRATION.

GYR-FALCON, or JER-FALCON (Falco gyr-falco or F. Islandicus), a species of Falcon (q. v.) of large size, the female, which is the largest,
GYRINUS—GYULA.

brown centre, until aged birds are almost pure white. It is rarely seen in Britain, and very rarely in the southern parts of the island, but inhabits all the very cold northern parts of the world. It was formerly in high esteem for falconry, and was procured at great expense from Iceland and Norway. It is sometimes called Iceland Falcon, and sometimes Greenland Falcon.

GYRINUS, a Linnean genus of coleopterous insects, now constituting a family, Gyrinidae, closely allied to Dytiscidae or Water Beetles (see Dytiscus), but differing in having the antennae very short, the two fore-legs long and stretching forward like

arms, the other legs very short and comparatively broad. The eyes are divided by hornv processes, so that each of them almost becomes two. The body is oval, as in the Dytiscidae. The Gyrinidae are very generally characterised by metallic brilliancy of colour. They are mostly small insects. They fly well, swim and dive well, spend the winter in the mud at the bottom of ponds, and in spring and summer may be seen swimming very actively on the surface of the water, ready to dive on the slightest alarm. In diving, they carry down with them a bright bubble of air. They generally swim in little parties, seeming to chase each other in circles, whence their French name, Tourniquete, and their English name, Whirligig. They feed on smaller aquatic animals, which they seize in their gyrations. They deposit their eggs on the leaves of aquatic plants. Their larvae are aquatic, having their bodies composed of thirteen deeply divided rings, of which three bear the feet, and the rest bear filaments probably serving as organs of respiration. The most common British species is Gyrinus natator, a smooth shining blackish insect, three lines long.

GYROMANCY (gyro, a circle, and mane, prophecy) was a method of divination by means of a circle, and was generally performed in the following manner: the soothsayer described a circle, and marked it all round with letters; then he commenced to walk round the circle, repeating his incantations, and at the places where he stopped the letters were carefully noted, and by the interpretation put upon these letters, the answer of the god was obtained.

GYROPHORA. See TIPLE DE ROCHE.

GYROSCOPE, an instrument invented by M. Foucault to render palpable to the eye the earth’s rotation. Its success depends on the principle, that if a mass be set in rotation freely in space, it will, unless disturbed or constrained, preserve absolutely the plane of its rotation, and will, to effect this, even overcome slight obstacles. In the gyroscope, a heavy ring of metal is almost freely suspended by mechanical contrivances, after having communicated to it, before being set in its frame, a very rapid motion; and to maintain itself in the plane of its rotation, while the earth in revolving on its axis turns round the whole mechanism, it causes a graduated slip to move round under a telescope placed in position, and so renders the earth’s motion palpable to the eye.

GYU’LA, a town of Hungary, in the county of Bokes-Canad, is situated on the White Kōrica, which divides it into the German and Hungarian quarters, 30 miles north of the town of Arad. The trade is chiefly in cattle. Pop. 15,620.
H

THE eighth letter in the English alphabet, belongs to the order of gutturals, and is a mere attenuation of the sound indicated by the Greek χ and the German (and Scotch) ch. The tendency of guttural sounds to become lighter and lighter, and at last disappear, is strikingly seen in tracing the history of the letter h. The form of the character corresponds to the Phoenician or Hebrew cheth (ח) and the Greek χ (H, probably at one time pronounced χετα), which denoted originally the syllable chel. The Greeks dropped the guttural part of the sound, and took the character to mark the vowel χ, while in the Latin alphabet it was taken to mark the (faint aspirated) guttural. That the sound of χ in Latin must have been faint, is proved by the fact, that many words were written indifferently with or without an A; as homnus or onmns; akhew or akew. In the languages derived from the Latin, the force of χ has almost disappeared. It is retained in French as a character, but is scarcely heard in pronunciation. The Italian language altogether ignores the character. In Spanish, it has taken the place in many cases of the Latin χ, as hijo = Lat. filius, a son; humor = fumus, smoke.

In the languages of the Gothic stock, Κ often represents the hard guttural sound of κ or c. See letter C. This substitution, and the subsequent disappearing of χ, especially before r and l, have completely disguised the relationship of many words which are yet of the same root; e.g., Eng. race; Ang.-Sax. hære; Lat. crux, cross, cruel, cruel, bloody, raw.

The natural tendency in English, as in other tongues, is to attenuate the sound of χ, and altogether eliminate it. This tendency is strongest among the illiterate, who are unrestrained by the presence of the written character; and accordingly ‘to drop one’s h’s’ (e.g., am for ham) is a sign of the want of education and of vulgarity. The perversity of putting h where it ought not to be (e.g., kepyg for egpyg), is not easily accounted for.

The Germans use the letter H, in their musical notation, for the same note which we call B, while they call our B flat simply B; possibly from the flat seventh being more nearly related to C, as a fundamental note, than B natural the sharp seventh is, which designate H. Thus, avenues of trees. Pop. (in 1860) 30,000. H. is the seat of government for the province, and the see of a Catholic bishop. Among its 13 churches, the principal is that known as De Groote or St. Baro’s Kerk, which was built in the 16th c., is the largest in Holland, and is specially noted for its lofty tower and its famous organ, constructed by Müller of Amsterdam, which, till recently, was the largest of its kind, having 5000 pipes, 60 stops, and 4 rows of keys. Before the church stands the marble statue of Laurens Coster (q. v.), to whom his countrymen ascribe the invention of printing. Among the buildings worthy of note, we may instance the town-hall, with its fine tower, and the residence of the Counts of Holland; the palace of the states-general; the prison; and the Teyler Institution, which is endowed with ample funds for the poor, and has numerous scientific and antiquarian collections. H. has a good gymnasium, numerous academical, scientific, and benevolent institutions, and is also the head-quarters of the Society of National Education, which has here its school for teachers. Although H. is no longer celebrated, as in former times, for its flourishing trade, it still possesses extensive refineries of salt, tanneries, foundries for type of Greek and Hebrew, and various manufactories of silk, linen, and thread, and carries on an extensive trade in flowers and seeds, sending its tulips, hyacinths, and other bulbs to every part of Europe. H. was a flourishing town as early as the 12th c., when it took an important part in the wars between the Hol-landers and West Frisians; and the defeat of the Counts of Holland in 1572—1573, which is unparalleled in the annals of history for the heroism evinced by the citizens, and for the atrocities which, in violation of their faith, the Spaniards perpetrated after the surrender of the city.

HAARLEM LAKE, which is now drained, lay between the towns of Haarlem, Leyden, and Amsterdam, and communicated with the Zuider Zee, by a narrow strait called 'Het Y.' Before its thorough drainage (1839—1852), it embraced the four ponds of Haarlem, Leyden, Spieger, and Halle, which, in consequence of an irrigation of the sea in the 16th c., when several villages were destroyed, had merged into one vast sheet of water, and in the course of time encroached so far upon the adjacent land as ultimately to cover an area of more than 60,000 acres. The depth did not exceed 15 feet, more than half of which was composed of mud and clay, from which the Dutch prepared, by baking, compact masses known as 'klinkers,' which were used for purposes of paving. The waters of the lake frequently rose during storms to an alarming height, necessitating an enormous annual outlay in keeping the dams and sluices in repair. In consequence of the damage done to the
the cities of Amsterdam and Leyden by an overflow of
the lake in 1836, the government entered into
a compact with a company of English engineers to
drain it. This undertaking was effected by several
great schemes of drainage. The water was
dug up into a series of canals which had been
dug round the circumference of the former area
of the lake, and connected with various inlets of the
sea. By these means the bed of the lake was left,
dry, except a channel for the purpose of drainage,
and a space of more than 40,000 acres of good land
reclaimed and thoroughly drained. This has now
been divided into farms, and is under tillage or
pasturage.

**HABAKKUK** (Greek forma, Amlethoum, Abel-
cum, &c.: Latin, Ambascom, Ambseceum, and Abacab,
the eighth of the twelve minor prophets. No account
whatever is contained in the book itself either of
the events of his life, or even the date when he
lived; and the numberless conjectures that have been
made as to this subject are of notice.

In turning to the book itself, we find, first of all,
bewailing the general corruption of his people,
and propheecyng the speedy vengeance of God by
the hand of the Chaldeans. These, however, shall,
when they have fulfilled the divine wrath, perish
suddenly themselves, because of their own iniquities;
and the prophet winds up with thanks for this
just retribution. It is evident from this that H.
must have written at a late period, about the time
of Nebuchadnezzar’s invasion; but whether he wrote as
the rabbinical traditions suppose—at the time of
Manasseh, or as others (Kell, Davidson, Delitzsch)
assume, at the early time of Josiah, or, finally, in
the days of Jehoahaz, according too H. Zimmern,
Rossmüller, Knobel, Meyer, De Wette, Hitzig, Stahelin,
are points upon which we cannot enter. We
must not omit to mention here, that the various
chapters have also been supposed to have been
written under different successive kings (Rossmüller,
Kalminsky, &c.); but the unity of the
whole book is so obvious, that this notion has been
almost unanimously rejected.

Critics have, in all times, been unanimous in their
praise of the style of this prophetic composition.
It ranks, indeed, for grandeur and sublimity of
conception, for vigour and fervour of expression,
for gorgeousness of imagery, for melody of language,
and perhaps for neatness of construction.
It is more especially the peculiar strophic arrange-
mont of the second chapter, with its awful four
‘woes’ denounced against the Chaldeans, and above
all, that matchless ‘Fidulario Ode,’ as Ewald calls
the third chapter, which have challenged universal
attention and admiration.

**HABEAS CORPUS, Warrant of**, a writ directed
by courts of law or equity to produce the body of
a person illegally detained, and to state the reasons
of such detention, so that the court may judge of
the legality thereof. This writ is the triumph of the chief
guards of English liberty, and the envy of foreign
nations, being one of the best securities against
tyranny ever devised. It is often erroneously sup-
posed that this efficacious protection of personal
freedom was first bestowed by the statute of 31 Ch.
II. c. 2, called the Habeas Corpus Act. But the true
foundation of that act, as well as of many other
cardinal principles of the English constitution, is to
be found in the Great Charter, or Magna Charta, of
which Hallam (1 Const. Hist. Ing. i. 130) observes sh. No
freeman could be detained in prison except upon
a criminal charge on conviction, or for a civil debt.
In the former case, it was always in his power to
demand at the Court of King’s Bench a writ of
_habeas corpus ad subjiciendum_, directed to the
person detaining him in custody, by which he was
enjoined to bring up the body of the prisoner, with
the warrant of commitment, that the court might
judge of its sufficiency, and remand the party, admit
him to bail, or discharge him, according to the
nature of the charge. This writ issued of right, and
could not be refused by the court. The Great
Charter, as Professor Cressay sums up this part of
its provisions, makes a great difference; and the
perpetual, that no man shall be imprisoned on mere general
grounds of suspicion, or for an indefinite period, at
the discretion or caprice of the executive power; but
that imprisonment shall be only inflicted as the result of a legal trial and sentence, or for a just pur-
purpose of keeping in safe custody, when necessary, an
accused person on a definite charge, until he can be
tried on that charge. Secondly, that, as a general
rule, every person accused of a criminal offence shall
have the question of his guilt or innocence deter-
mined by a free jury of his fellow-countrymen, and
not by any nominee of the government. And Black-
stone, with great spirit, thus discourses on the social
and political effects of this feature of the British
constitution (1 Bl. Com. 135):—"Of great importance
to the public is the preservation of this personal
liberty, for if once it were left in the power of
any, the highest, magistrate to imprison arbitrarily
whoever he pleases, the public safety would soon be
an end of all other rights and immu-
nities. Some have thought that unjust attacks,
even upon life or property, at the arbitrary will of
the magistrate are less dangerous to the common-
wealth, than when the most benign laws are made upon
the personal liberty of the subject. To bereave a
man of his liberty, or by violence to confiscate his estate
without accusation or trial, would be so gross and notorious an act
of despotism, as must at once convey the alarm of
tyranny in every house, and in time of war the
heart of every subject would be prey to the
secret apprehensions of his own person. It would be
so detestable, that, if once it were permitted, the
whole state would be in danger of being
subverted."

The Habeas Corpus Act, which was passed in
31 Ch. II. c. 2, therefore did not introduce any new
principle, but merely defined with greater precision
and detail the appropriate remedies, in consequence
of the frivolous objections made by the judges in
the preceding reign. The substance of these
details is as follows: Where any person is committed
and charged with crime, the lord chancellor or any of
the judges may, unless there has been great delay
in application, issue the writ, and order the person
to be brought up and discharged with or without
bail. The writ is to be obeyed more or less promptly
according to the distance, but in no case must the
delay exceed thirty days. Any officer who neglects
to deliver a copy of the warrant of commitment,
or shifting the prisoner to another custody without
cause, shall forfeit £100, and for the second offence
£200, and be disabled to hold office. No person once
delivered by the Habeas corpus shall be recommitted
for the same offence under a penalty of £500.
Every person committed for treason or felony may insist
on being tried at the next assizes, or admitted to
bail, unless the cause cannot be ready in that
time; and if not tried at the second assizes or
HABENDUM—HABIT.

HABERE FACIAS POSSESSIONEM, in English Law, is the name of the writ which issues after a successful plaintiff has recovered a judgment in an action of ejectment. He then calls on the sheriff, by this writ, to put him in possession of the land or premises, and the sheriff executes it by breaking open the doors, if necessary, and then delivering over the possession to the plaintiff. Habere facias seimem is a similar writ, now superseded by the last.

HABERGEON, a short coat of mail, consisting of a jacket without sleeves. In early times, the habergeon was composed of chain-mail; but in the 14th c., a habergeon of plate-armour was worn over the hauberk. See HABERRE.

HABIT. This familiar word applies to a certain portion of our acquired powers or aptitudes. Common usage does not very closely define the kind or extent of acquisitions intended by it. Habits may be either intellectual or moral. We speak of a habit of talking or writing, as well as of a habit of early rising, or of truthfulness.

The principle of the human constitution on which the growth of habit depends, when generalised to the utmost, may be called the power of retention, or of plastic growth, and is one of the foundations of the intellect, inasmuch as memory and all the other intellectual faculties involve it in a greater or less degree. See INTELLECT, and ASSOCIATION OF IDEAS. Education of every kind must proceed upon this property, and should be conducted in conformity with the exact nature of those maxims that govern the formation of habits are the same as the principles of mental acquirement in every shape. Some of the most important of these may be indicated here.

1. It should be understood, at the outset, that all persons are not alike susceptible of the growth of new powers, or of the process of education; nor is the same person equally susceptible as regards all subjects. The consequence is, that a much greater amount of practice is necessary in one case than in another; iteration being the mode of supplying the defective cohesiveness of the system.

2. However common the remark, that youth is the season for improvement, it may be doubted if we generally appreciate to the full degree the superior plasticity of early years, and the gradual decrease of the property as life advances. The as yet unoccupied space of the infant mind must be taken into account along with the very great energy of the principle of growth, which gives a firmness and security of hold to early impressions beyond everything that is communicated in later life. We see this in the impossibility of eradicating a provincial accent after one has grown to maturity; so the opinions and sentiments contracted in youth can seldom be changed in middle or advanced life.

3. In acquiring habits, the favourable disposition of the mind is of the greatest importance. Liking, taste, or predilection for the task concentrates all the energies of the system upon the work, and favours to the utmost the cementing process. A strong natural liking will of itself convert the use of a natural aptitude, by making the most of what power there is.

4. In the default of natural liking for the subject, the attention may be secured to a certain extent by pains and penalties; but as these waste and enfeebish the powers of life altogether, there is a loss on the whole, although there may be a gain in the particular case. The education of the young cannot be conducted wholly on the principle of fascination; but if pain has to be frequently or systematically
HABIT AND REPUTE—HADDINGTONSHIRE.

resorted to, no considerable general progress need be looked for.

5. Health, freeness, and vigour in the bodily system are conditions of the growth of habit. The brain may be powerful in a feeble body, but a certain co-operation of the other organs is necessary to the integrity of its functions; and when the stage of nervous exaltation has been reached, there is nothing gained by continuing the exercise. After adequate rest and refreshment, the plastic property is at its height; there is a limit to what it can perform, which is marked by the approaching sense of fatigue; and at this point, the efforts in the way of learning should cease. The prevailing error hitherto has been to overrate this limit, and to keep up school exercises too long at one time. A short interval engenders new vigour.

6. These observations apply to mental acquisitions generally. In the peculiar case of moral acquisitions—such as habits of fortitude, courage, contentment, honest dealing, obedience—some special causes restrain a person only use a place, there must be a powerful initiative, or some influence strong enough to make a decided commencement and to keep up the desired conduct for a certain length of time. Either the coercion of some authority, or a powerful example of an energetic resolution of the individual will, should induce the person to enter on the course prescribed, and to persevere until the plastic process, in other words, the power of habit, has had time to operate. The commencing stimulus may then be gradually withdrawn in favour of the self-sustaining force that has engendered.

HABIT AND REPUTE, a phrase used in Scotch Law to denote something so notorious that it is taken without further proof to be true. The best known example of this is where a man and woman cohabit as husband and wife, and are reputed by the neighbours to be married, in which case, Scotch Law, assumes, as a positive and incontrovertible fact, that a previous marriage had taken place, and no evidence to contradict such a presumption, or legal fiction, is even allowed. In England, no such doctrine exists, and the marriage would have to be proved in the usual way, if called in question, by a suit which directly raises such question though the parties had all their lives together as man and wife. There is also, in Scotland, an application of the doctrine, but the theory and reputed to persons when convicted of stealing; for if the individual is a habit and repute thief—i.e., a notorious thief—he's offence is greater, and liable to a more severe punishment. In England, a somewhat similar effect is produced, circuitously, by proving after the trial that the thief had been several times previously convicted, in which case he is generally punished by a severer sentence.

HABITATION, in the Roman Law, meant a servant or a person who only use a house as a habitation or dwelling-house, and for no other purpose. In England and Scotland, such a restriction can only be produced by the operation of express covenants or stipulations in the lease.

HACKBERRY. See Nettle Tree.

HACKLÄNDER, FRED. WILL., a popular German poet, was born at Buechheid, near Aix-la-chapelle, 1st November 1816. After several vicitissitudes, he proceeded to Stuttgart, where he commenced his literary career with Bilder aus demOOKDatenbuchen im Frieden, which appeared in the Morgenstelle, and has since been translated into several languages. The truth and pleasant humour of this little book attracted the attention of Baron von Taubenheim, who invited H. to accompany him on his travels to the East. The literary fruits of his voyage appeared in Der Doppelfotografische Auf einer Reise in den Orient (2 vols. Stuttgart 1842; 21 edit. 1846), and the Pilgerzüge nach Mekka, a collection of Oriental tales and legends. At a later period, he published Wachstüchen-Buch (a continuation of the Soldatenleben im Kriege, 1856), a history of the Rhenish-Merican, and a variety of smaller works. In March 1849, he went to Italy, was present in the campaign in Piedmont, and afterwards published his Soldatenleben im Kriege (2 vols. 1849—1850). In 1849 he married, and settled near Stuttgart, where he has since published several humorous romances: Handel und Wandel (2 vols. 1850), Eugen Stiftfried (3 vols. 1852), Namenlose Geschichten (3 vols. 1851), &c. On account of his powers of observation, his admirable painting of details, his kindly disposition, and pleasant humour, H. has been styled the German Dickens. His comedy entitled the Geheimer Agent has been performed on all the stages of Germany, and has been translated into Hungarian, Polish, and English. Not less successful was his Magnetische Curen. Later works are his Ein Winter in Spanien (1855), and Der neue Don Quixote (1858).

HACKMATACK. See LARCH.

HACKNEY, the name of a parish of England, in the county of Middlesex, which now forms a suburb of London, and is three miles north-north-east of St. Paul's. It was at one time a favourite suburban residence of the London citizens, but the current of fashion having for many years been setting to the west, H. no longer holds the rank it formerly did. In its earlier and fashionable days, it is said to have given its name to hackney-coaches.

HACKNEY-COACHMEN differ in no respect from other carriers, except that in addition they are generally put under police regulations in all the towns and cities of the United Kingdom, and a tariff of fares is fixed on them. They require a licence from the town-council or other similar body, and must conform to the regulations imposed by this authority. In London, acts of parliament passed to define these regulations, and the legal fare is fixed at 6d. per mile, or part of a mile. In other cities and towns, the legal fare is higher.

HADDINGTON, a market town and royal and parliamentary borough of Scotland, capital of the county of the same name, is situated at the foot of the Garleton Hills, on both sides of the river Tyne, about 16 miles east of Edinburgh. The old Abbey Church, a fine Gothic structure, in partial ruin, and situated close to the banks of the river, is the most interesting object in the town. John Knox and George Wishart preached in this church. Among the other principal buildings may be mentioned the Corn Exchange, necessarily a very commodious building, H. being one of the largest grain-markets in Scotland. The inhabitants are chiefly dependent upon agriculture, but there are nurseries, corn-mills, breweries, tanneries, &c., in the town and vicinity. H. unites with North Berwick, Dunbar, Jedburgh, and Lauderdale, to send a member to parliament. Pop. (1861) 3897.

HADDINGTONSHIRE, or EAST LOTHIAN, a maritime county in Scotland, lying between N. lat. 53° 4' and 56° 3', and W. long. 2° 25' and 3° 2', is bounded on the N. and E. by the Firth of Forth and the German Ocean, S. and E. by Berwickshire, and on the W. by Midlothian. The extreme length is about 25 miles, and breadth about 17; area, 179,142 acres, or 280 square miles. In the south of the county are the Tweed, rising to the height of 1732 feet. In the north and north-east is a strip of level ground of unequal
breath, composed of clay and loam, and mostly very productive for all kinds of crops. The climate is excellent on the lower grounds, and the rainfall much under the average. There are few streams of any considerable size, the principal being the Tyne, which flows north-east across the county into the sea at Tynemouth. East Lothian has long enjoyed high agricultural fame. John Cockburn of Ormiston, who is regarded as the father of improved Scottish husbandry, made a tour in 1725, and in the end of the 17th c., was the first to test its capabilities. This enterprising man gave long leases, and encouraged his tenantry to lay out their farms in regular enclosed fields. He introduced the culture of turnips, rape, and clover; and turnips in drills were sown on one of his farms as early as 1725, and brought to such perfection in ten years thereafter, that a specimen of a turnip, weighing 35 pounds, was sent for public exhibition to Edinburgh. Potatoes were also first planted in the fields in 1734 at Ormiston. Pennant says that hedges round fields were first planted in this county, and here the threshing-machine was first introduced, in 1796, by a gentleman of the name of Pinkie. In September 1748, the first steam-plough possessed by a tenant-farmer in Scotland was introduced into this county by Mr. Saddler, Ferrygate. The well-known varieties of wheat, Hunter's, Hopetown, Fenton, and Shirreff's beard, are all originated in Haddingtonshire. According to the agricultural statistics taken in 1855, the total number of acres under rotation of crops was 1,022,445, occupied by 669 tenants. The average produce per acre was—wheat, 28 bushels; barley, 38 bushels, 14 pecks; oats, 45 bushels, 14 pecks; turnips, 15 tons, 4 cwt.; potatoes, 2 tons, 3 cwt. There were 4,699 draught and other horses, 9,494 cattle, 20,760 sheep, 6218 swine. In 1862, 112,626 acres were under wheat, 186,317 under barley, 88,473 under oats, 37,952 under turnips, and 89,472 under potatoes. Another county which produces large returns for acre of wheat, 11 of turnips, and 27 of potatoes. The yield of oats, however, was much higher than that of any other county, and only one gave a higher average return of barley. Land rental, £384,475. Old valuation, £14,072. Coal and lime-stone are abundant in the county. The Kirkwall conglomerate of the 13th c., being the earliest recorded in Scotland. Parliamentary constituency, 673; returns one member to parliament. Pop. (1861) 37,624.

Historical interest is confined almost entirely to the Saxon period. The seat of the Counts was Dunbar, the Covenanting army in 1659; and Prestonpans, where the Pretender defeated the royal troops in 1745. Among the antiquities may be named the ruins of the Castles of Tantallon, Dirleton, Luffness, Hilles, and Innerwick. The principal towns are Haddington, Dunbar, and North Berwick.

HADDOCK (Gadus or Morhua Eleginus), a fish of the same genus with the cod, and much resembling it in general appearance. The number of fins is the same, as in the cod, including five dorsals and two anal. The H., like the cod, has a barbule at the point of the lower jaw. The H. is brown on the back, silver on the belly; the lateral line is black, and there is a black spot on the pectoral fins. H. is sometimes extending so as to meet on the back. A ridiculous legend ascribes these spots to the finger and thumb of St. Peter, and states the H. to be the fish from the mouth of which he took the tribute-money; the inventors of the legend never adverting to the improbability of a marine fish living in the fresh-water lake of Gennesaret. The H., indeed, is not even found in the Mediterranean. Nor does it enter the Baltic, although plentiful in the northern parts of the Atlantic Ocean, both on the Europan and the American coasts. On the British coasts, it is abundant almost everywhere, appearing in great shoals at particular seasons, and in size and quality the haddock taken at one part of the coast differ much from those of another. Those of the east coast, and particularly those caught in deep water, are in great esteem, and those of Dublin Bay are remarkable for their large size. A H. of 16 lb. has been taken at Dublin Bay. Generally, however, this fish is much smaller. It is taken both by trawl-nets and lines. Pieces of the herring and sand-eel are most attractive baits.

The H., when really of good quality, is perhaps the finest of all the Gadidae; and the numbers taken on some parts of the British coasts are very great, rendering it, in an economical point of view, a very important fish. It does not 'take salt' so well as the cod, but is often cured by drying and smoking. In March and April, the H. is out of season; in October, November, December, and January, it is in best condition. Finans Haddocks and Driers are well known, particularly in the Scottish markets.

HADERSLEBEN, or HADERSLEV, an old city of Denmark, in the north of the North Frisian or Slavish, on the Hadersleben Fiord, a narrow arm of the sea, stretching inland westward from the Little Belt, 33 miles north of Flensborg. It has several churches, one of which, the church of St. Mary, is a large and handsome edifice; a port for small vessels; and a gymnasium. Pop. 7,477.

H. received its town-rights from Waldemar II., in 1292; and here, in 1448, Count Christian of Oldenburg was elected king of Denmark, and began the present dynasty.

HA'DES, in Greek Mythology, was the god of the lower world, more commonly spoken of as Pluto (q. v.); the name was also applied to his kingdom, the abode of the departed spirits or shades. See GREEK RELIGION, also HEAVEN and HELL.

HADITH (something new, a story, legend, tale; emphatically, Hadith Ar-Rasul), the traditions about Mohammad the Prophet's sayings and doings, which, as a complementary to the Koran, form, together with it, the supreme authority for all religious and legal matters of the Mohammedans. Originally, it was not allowed to commit them to writing (like the Mishah, q. v.), but the danger of their being entirely forgotten in the course of time, led to their being written down in the first centuries after Mohammad's death, the standing, know them well by heart are honoured with the title of Hāzīl (retainer, keeper). The six principal sources for these traditions are Ayeshah, after the death of Chadija, the prophet's favourite wife; Abu Hureira, his constant companion and servant; Abdallah Ibn Abbas; Abdallah Ibn Omar b. Al-Aas; Djaber b. Aidallah Ansari; and Ans b. Malik. The principal and most authoritative collections of traditions are those of Bohari, Malik, Abu Dhar, Tamess, Issa, Moslem, and Sojuti. Of these, again, the most important code is the Sahih of Bohari, who, it is said, spent sixteen years of his life in travelling through the length and breadth of the land for the purpose of collecting such traditions, and who singled out, from a number of 60,000, about 7270 as alone genuine. This code has been printed for the first time with commentaries (Delhi, 1845—1854, of which only three copies are to be found in Europe or is at present in the British Museum); and another edition (by Krehl, in Leyden) is now in the course of preparation. See SUNNA, MOHAMMED, MOHAMMEDANISM.

HADJI KHALIFAH, the surname of Mustafa-ben-Abdallah, a celebrated Turkish historian, 179
HADELMANN.

HADLEY—HÉMASESTATICS AND HÉMADYDYNAMICS.

who was born at Constantinople about the end of the 16th c., and died in September 1658. From 1622 till 1633 he was employed in the Turkish army, and had an excellent opportunity of acquiring information regarding matters of history, geography, &c., of which he eagerly availed himself.

H.'s works are written in Turkish, Arabic, and Persian. Besides a number of smaller works on geography and history, we have the celebrated _Asmai al-kotob ve al-fonum_ (Names of Books and Sciences), written in Arabic, and of which Flügel has given a translation with the text under the title _Lexicon Bibliographicum et Encyclopaedum a Museis_. (Leip. 1833—1838, 7 vols.). There is also a French translation, by Petis de la Croix (1694—1765), which is to be seen in MS. in the Imperial Library. In this work, H. gives a definition of each science and the principal writers on each; specifies the titles, contents, language, dates of composition, and translations of more than 25,000 works; also the names of the authors and dates of their death. It is the most complete catalogue in existence of works written in Arabic, Persian, and Turkish; _Tarikh Kehir_ (Great History), a history of the world from the creation of Adam to 1635, containing notices of 150 dynasties, principally Asiatic; also a history of the Ottoman empire from 740 to 1658; and a history of the maritime wars of the Turks, which has been translated into English (Lond. 1831).

HADLEY, John, an English mathematician, the intimate friend of Newton, from whom, as is now generally supposed, he borrowed the idea of the instrument called Huygen’s Quadrant (see Sextant).

In 1717, he became a member of the Royal Society, before which he read some useful papers, which were afterwards published in their Transactions. The honour of having invented the sextant is claimed by his supporters for H., Godfrey, and Newton; for H., because he was the first to construct the instrument, and give a description of it, which he did in 1731, before the Royal Society; for Godfrey, because, in 1739, he presented a gentleman in Philadelphia, United States, with a description of the instrument almost coinciding with H.’s, which description was transmitted to the Royal Society in 1752; and for Newton, because he, in 1727, gave a description of the instrument to his friend, Dr. Halley, for some reason unknown, suppressed it, and it was not till after his death in 1742 that it was discovered. The Royal Society decided that Godfrey and H. were both entitled to the honour of the invention and awarded each a reward of £200. H. died 15th February 1744.

HADRIANUS, P. ÁELIUS, a Roman emperor (117—138 a.d.), was born at Rome, 24th January 76 a.d. During the reign of Trajan, who was his guardian, and with whom he was connected by marriage (his father, who was a Roman senator, having married the aunt of Trajan), he filled several high offices in the state. He accompanied the emperor in his wars against Decebalus, where he distinguished himself by his bravery; and in 117, when Trajan set out on his return to Italy, he was left in charge of the army with the title of governor of the province of Syria. When the intelligence reached Antioch that Trajan had died in Cilicia on his journey home, H. was proclaimed emperor by the army, August 11, 117 a.d. The state of the empire at this period was extremely critical; revolts in the Parthian provinces had broken out in Egypt, Palestine, and Syria; Mesoia in the East, and Mauritania in the West, were both invaded by barbarian hordes; while the Parthians had once more asserted their independence, and won several successes over the imperial forces. H., perceiving the advantage of a peaceful policy, wisely resolved to limit the boundaries of the Roman dominion in the East, and concluded a peace with the Parthians after the battle of Carrhae; the army was then recalled; he left all the country beyond the Euphrates. In 118, he repaired to Rome (where he had been acknowledged by the senate), established his authority by liberality towards the people, and suppressed with great severity a partisan conspiracy among some of the senators. The Romans (modern Russians), who had made an inroad into Mosia, were induced to retire by large gifts. In the year 119, for the purpose of becoming acquainted with the state of the provinces, he commenced his celebrated journey, which he is said to have performed chiefly on foot. He visited Gaul, Germany, Britain (where he built the famous wall extending from the Solway to the Tyne), Spain, Mauritania, Egypt, Asia Minor, and Greece, whence he returned to Rome, 126 or 127 a.d., and received the title of _Pater Patriae_. H. spent the years 132 and 133 in Athens, for which city he had a great predilection. After once more visiting Syria, he returned to Italy, where he conducted the rites of his life at Rome and Tibur. During the severe illness which carried him off, July 10, 138, at Baiae, he was subject to violent outbursts of cruelty, to which, as well as to jealousy and pleasure, he was naturally addicted. After his death, 138, H. was writ a history of the Parthians; the above-mentioned book, to which he had adopted the name of _Lucius Áelius Verus_, he appointed Titus Aurelius (afterwards the emperor Antoninus Pius) his successor. During his reign the army was rigorously disciplined, and the barbarians were not likely to attribute H.’s conciliating and peaceful policy to fear or weakness. As a civil ruler, he merited high praise, particularly for the just and comprehensive view he appears to have taken of his duties as a sovereign. Hence to him is attributed, more than to any other, the consolidation of the monarchical system of Rome. H. also divided Italy into four parts under four consuls, to whom he intrusted the administration of justice. H. erected numerous splendid edifices, the chief of which were—the mausoleum called the _Maus Hadrani_, in Rome (the ground-work of the modern castle of St. Angelo), the Áelian bridge leading to it, and the magnificent villa at Tibur. He likewise laid the foundation of several cities, the most important of which was Adriannels. H. was a lover of the fine arts (in the history of which, as well as of jurisprudence, his reign forms an important era), of poetry, philosophy, and rhetoric, all of which he attempted. He set a high value on Greek literature, and likewise on the cultus of Greece, and caused himself to be initiated into the Eleusinian mysteries.

HÉMADYDYNAMOMETER (derived from the Greek words _hémadynamos_ [blood, dynamis, force, and _métron_, a measure]) is the name of an instrument devised about thirty years ago by Poisiville for determining the pressure of the blood in the arteries and veins of the living body. The pressure of the blood is measured, as in the barometer, by the column of mercury that it balances. The instrument has been recently improved in various ways, and a contrivance has been added by which the oscillations of the mercury are inscribed in the form of an undulating curve on a cylinder made to revolve by clock-work; the height of the undulations denoting the pressure, and their horizontal amplitude the time.

HÉMASESTATICS AND HÉMADYDYNAMICS, The Statics (q. v.) and Dynamics (q. v.) of the Blood (Gr. _Haima_). See Blood, Circulation of the Blood.
HEMATOMESIS—H.EMATOZOA.

H.EMATOMESIS (Gr. haima, blood, and enmeia, vomiting, a rejection of blood from the stomach, usually in consequence of some morbid change in its mucous membrane. See STOMACH, Diseases of. Hematemesis is ten for Hsematemesis (q. v.), unless careful attention is given to the mode in which the blood is ejected. The proper remedies are the liberal use of ice or of ice-cold water; acetate of lead in doses of two to five grains; tannin, five to ten grains (it must not, however, be given with acetate of lead); oil of turpentine, six to ten drops, repeated every hour or two. The first and the last are perhaps the most effectual means, which can be used in combination. The turpentine may be given whipped up with the white of an egg. It must be discontinued when the symptoms of uraneous irritation begin to appear.

HEMATINE, or H.EMATOSINE, is the term applied by chemists to the red colouring matter of the blood of the higher animals. In the normal state, it occurs in solution in the interior of the blood corpuscles or cells; but in certain morbid conditions, in which the blood undergoes a species of decomposition, it is deposited in a solid form in the tissues surrounding the smaller vessels that have percolated. It can only be isolated in a coagulated form, in which state it has been submitted to analyses by Mulder, who assigns to it the formula C14, H12, N4, OFe. Its chief peculiarity is, that it contains a proportionately large percentage of iron (very nearly 7 per cent.). It is the only constituent of the body (if we except the hair) which does contain this metal.

H.EMATITE (Gr. haime, blood), a mineral consisting chiefly of peroxide of iron, often occurs in large quantities, and is a valuable article of trade. There are two principal varieties, Red H. and Brown Hematite. The former frequently occurs in globular and globular-like masses, with a radiating fibrous structure. It is sometimes of a dull reddish-brown, sometimes of a brilliant bluish-gray colour; the streak is blood-red. An earthy kind is called Iron Froth, and consists almost entirely of peroxide of iron. Brown H. contains about 14 per cent. of water. Its colour is of a somewhat dull brown, sometimes almost black. Different shades of colour are often presented in concentric wavy bands. The surface is often covered with a beautiful black varnish, which is sometimes iridescent. It is not unfrequently found in rhombohedral, prismatic, or tabular crystals. The primary form is a right rhombic prism. Both Red H. and Brown H. are found in Britain, but the former more abundantly.

H.EMATOCELLE (Gr. haima, blood, and ede, tumour), a tumour containing blood; opposed to Hydrocele (q. v.).

H.EMATOXYLENE is a chromogen (a term used by chemists to denote certain nearly or quite colourless substances which, under certain influences, yield well-marked colours) obtained from logwood (Hematoxylon Campechianum). Its composition is represented by the formula C24H12O10 + 6aq., and in its pure state it occurs in transparent glistering straw-coloured prisms. It has a sweet and not astrangent taste, is sparingly soluble in cold water, but dissolves readily in boiling water, alcohol, and ether. The watery solution is not affected by the oxygen of the air, but if a very small quantity of ammonia is added, it assumes an intensely reddish-purple colour.

Hematoxyline is obtained by mixing powdered extract of logwood with quartz sand (to prevent its agglomeration into lumps), and digesting this powder for several days with about six times its volume of ether. The liquid is then distilled till the residue assumes the consistency of a syrup. If this residue is mixed with water, crystals of hematoxyline are in a few days deposited, which on an average weigh about one-eighth of the extract that was employed.

The colour reactions of this substance with metallic compounds are singular, and in consequence of the conformation of some of them deserves a brief notice. Solution of acetate of lead gives with some of hematoxyline a white precipitate, which speedily becomes blue; salts of copper give a dirty green precipitate, which also soon becomes blue; chlorides of barium produce a red precipitate; precipitate of tin gives a rose-coloured, and iron alum, a saucy blackish precipitate.

The purple colour which the solution of hematoxyline assumes if oxygen and ammonia are present, is due to a decomposition, of which a substance termed haematin is one of the products; the compound resulting from the union of haematin and ammonia possessing this tint.

The solution of haematin-ammonia (or haematein, as some chemists have termed it) yields coloured precipitates with many metallic salts; with acetate of lead, it gives a deep blue, with sulphate of copper, a violet blue, with protochloride of tin, a violet, and with iron alum, a black precipitate.

It is upon the various reactions which have been described in the preceding paragraphs that the value of logwood as a dye depends.

H.EMATOZOA (Gr. hemera, blood, and zoa, a living creature) is the term applied by helminthologists to the worms or worms, presented in the blood of man, horse, and certain other domestic animals, which occur in mammals, birds, reptiles, fishes, and many invertebrate animals. Some of them belong to the Nematoidea, others to the Trematoda, and others to the Protozoa. They are of two sorts: (1) the parasitic worms, possessing a head and neck, with a single opening or mouth; (2) the functionary worms, consisting of a sequence of identical segments, and with a double opening, one for the entrance of the food and the other for the excretion of the excrement. The former are the parasites which usually cause disease, and are the objects with which we shall chiefly be occupied.

The Diatoma hematothodion is almost entirely restricted to the abdominal venous system; in the horse, the Schistosoma haematobium to the abdominal arterial system; and in the porpoise, the Parascaris equina to the pulmonary artery and its branches.

Nothing definite is known regarding the origin of these parasites, but certain observations made upon the H. of the horse by Valentine (and subsequently confirmed by Vulpius), lead to the belief, that some of the more minute forms are the larva of a worm living in the organs surrounding the vessels. We shall restrict our remarks to the H. occurring in man, the horse, and the dog. By far the most important of human H. is the Diatoma hematothodion already mentioned. It has only been observed in Egypt, where it is very common, and where it was found by Griesinger 117 times in 363 autopsies.

The male, which is the larger of the two, is about 3\(\text{r}^1\)4ths of an inch in length. The common Liver Fluke (D. hepaticum) has, in one instance at least, been found in the interior of the portal vein. In the various cases in which diatomata have occurred in tumours, they must have been conveyed to the places in which they were found by the blood.

In the year 1665, Ruych discovered a large number of small worms in a distillation of the mesenteric artery of a horse. Fifty years afterwards, a second case was noticed, and it is now known that such cases are of extreme frequency. These verminous aneurnias of the abdominal arteries occur in the horse, and in the mule, as well as in the horse. The worm found in them is the Schistosoma equinum.
H. EMATURIA—HAFIZ.

... differing forms found in these tumours 48 times in the examination of 70 worn-out horses.

For much very interesting information on this curious subject, the reader is referred to Rayer’s Memoir in the Archiv. de Médecine comparée for 1842.

In the dog, H. sufficiently large to be visible to the naked eye are rare. Thirteen such cases are collected by Davaine in his Traité des Entozoa, 1860, the worm generally being a filaria. The microscopic larve of a nematoid worm are sometimes found in enormous quantities circulating in the blood of this animal. From the examination of the blood of 490 dogs, Gruby and Delaoulé believe that I in every 20 of these animals presents this peculiarity.

In none of the above cases does the presence of these entozoa appear to affect the general health of the individual in whom they reside, whether he be man, horse, or dog. For further information on this subject, the reader may be referred to Davaine, op. cit., pp. 398—422, and Vogel’s Pathological Anatomy, p. 442, &c.

H. EMATURIA (Gr. kaima, blood, and ouron, urine), the discharge of blood with the urine, usually from disease of the kidneys or bladder. It is rather a symptom of a disease, and takes its character from the associated morbid conditions of the parts concerned. It is a symptom always of some gravity, but not very often directly fatal. Perhaps the best general remedy is the tincture of the marrate of iron, given in doses of twenty drops.

H. EMODORACE. E, a natural order of endogenous plants, consisting of herbaceous plants with fibrous roots, and sword-shaped leaves; differing from Iridaceae in habit, and in having the stamens six in number, or if only three, opposite to the petals. There are about fifty known species, chiefly natives of North and South America, South Africa, the Mascarene Islands, and New Holland. Some of them have beautiful flowers. A red colour exists in the roots of some; hence the name Blood-root has been given to them. In this order are ranked the Vellicius or Tree Lilies.

H. EMOPHTYSIS (Gr. ptyosis, spitting), expectoration of blood, a very significant and often dangerous symptom of disease of the lungs or heart, in all cases of the greatest importance, and requiring immediate attention, but apt to be viewed popularly with a somewhat exaggerated alarm. It is seldom directly fatal. It is rather as an indication of dangerous disease, than from its immediate danger, that it requires such careful attention; but unquestionably, it is a matter of common prudence to seek medical advice on the appearance of even the slightest tinge of blood in the expectoration from the lungs. The gravity of this symptom depends very much on its cause. The treatment can scarcely be undertaken without a medical examination; but in case of extremity, it may be desirable to know that repeated doses of Ipecacuanha (q. v.), carried even up to the emetic effect, have been of serviceable utility.

H. EMMORRHAE (Gr. a bursting forth of blood), a flux of blood from ruptured arteries, veins, or capillaries. See BLEEDING.

H. EMMORRHOIDS (Gr. flowing of blood). See PILES, for which disease hemorrhoids is a technical term, the usual way.

H. EMUS, MOUNT. See BALKAN.

H. HEREDITAS JACENS, in Scotch Law, means the heritable estate which a deceased person has left, as it remains before the heir has made up a title to it, and wherefore the property lies to a certain extent in abeyance. When a creditor of the deceased wants to recover his debt, he was formally compelled by a circuitous process first to compel the heir to complete his title, or declare his refusal to do so; but now, by the statutes 10 and 11 Vict. c. 48, s. 16, and 21 and 22 Vict. c. 26, s. 27, he merely raises an action in the usual way, and obtains a decree of adjudication, under which he can help himself to the property. The expression of hereditas jacens is not used in England, where similar niceties of feudal conveyancing have long been extinct.

H. HERETICO COMBURENDI, an old writ in English ecclesiastical law for burning a heretic, now abolished by 29 Char. II. c. 9.

HAFF, a word now obsolete in ordinary speech, signifying, in the Danish language, the sea, or a considerable portion of the sea. In German, it occurs only as the proper name of three estuaries of peculiar form on the southern coast of the Baltic—viz., the Stettin Haff (q. v.), the Frisches Haff (q. v.), and the Kuriisches Haff (q. v.). Haff-fishing is a term used by the inhabitants of Shetland to signify sea-fishing.

HAFIZ (one who knows the Koran and the Traditions by heart), MOHAMMED, SHAMS-AL-DIN (Sheykh Mousâ), also called Lâ'î (Voices of Mystery), an eminent Persian divine, philosopher, and grammarian, and one of the greatest poetical geniuses of all times. He was born in the beginning of the 14th c. at Shiraz, and early applied himself to the pursuit of science and learning. His proficiency in various branches of knowledge brought him under the notice of the then reigning House of Muzaffar, and he was not only appointed teacher in the royal family, but a special college was founded for him. His spirit of independence, however, stood in the way of his worldly advancement, and notwithstanding many offers of princely favour, he remained during his whole life in the humble condition of a drvish. The burden of his poetical compositions is for the most part wise, love, nightingales, flowers—in fact, beauty in every form; occasionally also the praise of Allah and the Prophet, and reflections upon the instability of life and its joys, though all of them there runs, however, a withering contempt of all professional piety, mock-humility, and sanctified abhorrence of the good things of this world. These poems are of such exquisite sweetness, that the poet has also received the title of the “Sugurilj” (Suqurilj); his contemporaries speak of his having drunk from the fountain of life, a draught of which was brought to him, in reward for his untiring perseverance in study, and his power of self-abnegation, by Z.Khr (the Mohammedan Elijiih) himself. No less remarkable are the sudden and striking transitions in his writings, and the readiness of wit which he displayed on several noticeable occasions during his lifetime.

Hafiz was married, and appears to have reached a happy old age. The time of his death is uncertain, the date being variously given between the years 791 H. (1398 a.d., the date on his tombstone), and 797 H. (1394 a.d.). The enmity, however, which had been provoked in the breasts of the zealous defenders of religion by the freedom of his manners, and his more than Sufistic contempt for the outward forms of religion, broke out undeniably against him at his death. The enemies of religion refused to repeat the usual prayers over the dead body, and after long altercation between the members of his family and his enemies, it was agreed that the question, whether his funeral should be according to the custom of the East, should be decided by lot. The result was favourable; whereupon he was buried with great honour.
The course of the Nile of H. are bond, sole pro-
ductions of a most licentious nature, or are intended as
an allegorical and mystical revelation of things
divine in the manner of Sufism (q.v.), as is declared by
H. S. Pouss admirers, is a question which has at
different times been raised before ecclesiastical and
critical courts. A style brilliant, yet clear—imagine
gorged, yet clothed in pure and unaffected diction —
undulating melody and classical harmony, are the
chief characteristics of H.'s anacreontic lyrics, which,
have not only become the national poetry of his
country, but are even appealed to as an oracle on
most important questions of peace and war.
The number of their commentators is legion; the most
valuable notes, however, are those of Sufi, Sudi.
The Divas was first collected by Said Kasim Anvari, after the death of the poet.
Litho-
graphed and printed editions of H. have been pub-
lished at Calcutta (1790) and 1928, at Bombay (1828—1599), at Cawnpore (1831), Bulak (1834 and 1840):
Constantinople (1841), &c. A very valuable edition by H. Brockhaus is now in the course of pub-
lication at Leipzig. Of translations in European tongues, we may mention those of Rewitzki in Latin
(Vienna, 1771); Richardson, Jones, Ouseley, Hindley, Rousseau, in English; and by Hammer-Purgat-
tal, and Daumer, in German.

HAG (Mycter or Gastrobrancus), a genus of carti-
laginous fishes, allied to lampreys, and with them
ranked among Dermopterous Fishes by Owen. The
fishes of this genus are of low organisation, and
seem to connect fishes with cephalopodous molluscs.
The vertebral column is reduced to a mere flexible
cartilaginous tube, nor are there any other bones. The
shape resembles that of an eel or worm, and

HAIG—HAGENBACH.

skin and skeleton. A fish which has been thus
treated is called a robed fish. Six hags have been
taken out of a single haddock. The hag is also
said to make its way into fishes through their
mouths, and is therefore sometimes called the Borer.
Some suppose, however, that hags are swallowed by th.
fishes on which they afterwards prey. The glutinous
hag attains a length of 12 to 15 inches, and is
covered with a mucus fluid, which soon turns into a
kind of jelly. It is of a dark-bluish brown colour above,
and whitish beneath. The quantity of mucus which
it exudes is so great that a single hag, confined in
a jar of water, soon turns it all into a kind of jelly.
The mucus is extracted from lateral pores.

HAGAR (LXX. Ager), Gen. xvi. ff., an Egypt-
ian bondwoman of Sarah. This her Semitic name
(the Egyptian is unknown) has been derived from
various roots, and has been translated accordingly
'slender,' 'stranger,' and 'flight' (in allusion to
her after-life). Sarah having remained barren
up to a very advanced age, at last gave H. to
Abraham, ten years after his sojourn in Canaan,
as a concubine—according to the Eastern custom—in
the hope of being 'edited through her', i.e., estab-
lishing a family of her own. H. bore Abraham a
son, whom he called Ishmael (God has heard),
and who was born when the husband of the future father of the
prophecy promised him. But sixteen years later,
and when Abraham was (we are told) a hundred
years old, Sarah herself bore Isaac; and we find
it significantly repeated nine times in seven verses
(Gen. xxi. 2—9) that Abraham and Sarah were
his parents—in repudiation, according to rabbinical
authorities, of certain rumours about Isaac's illegi-
timacy, spread by Hagar. At last the domestic
contentions arose between them. Hagar, however,
thought reluctantly, to cast out H. together with
Ishmael. How the two fugitives lost their way
in the desert of Beersheba; how the water in the
bottle being spent, the broken-hearted mother set
herself at a distance from her child, in order that
she might not see his death; how her weeping
and the loud voice of the boy were answered by an
angel, who pointed out a well (Temzem, in the
enclosure of Mecca)—all this forms one of the most
touching and well-known narratives of the Bible.

In the New Testament, H. is referred to allegor-
ically as Mount Sinai or 'the Jerusalem which now
is' (Gal. iv. 22). Some rabbinical traditions (Ber.
R. 67 d.) identify her with Keturah, the second wife
of Abraham, mentioned Gen. xxv. 1; others (Ber.
R. 51 d.) make her the daughter of Pharaoh, who,
seeing the miraculous intercession on behalf of
Abraham in Egypt, said: 'Better that my daughter
should be the slave of this man than the queen of
any other.' The Mohammedans look upon H. as
the legal wife of Abraham, and she is supposed to
be buried in Mecca.

HAGBERRY. See Bird-cherry and Nettle-
Tree.

HAGEN, a small town of Prussia, in Westphalia,
is situated on the Volme, 26 miles west of Arns-
berg. It contains several churches, and has a popu-
lation of 6920, who carry on a considerable industry
in dyeing and printing, and in the manufacture of
cloth and hardware.

HAGENBACH, KARL RUDOLF, German theo-
logian, was born, 4th May 1801, at Basel, where
his father, Karl Friedrich Hagenbach, author of the
Testaments der Hebräer, was professor of Hebrew
anatomy and botany. While at the universities
of Bonn and Berlin, he became acquainted with
the direction given to theology by Schleiermacher;
and on his return to Basel, he received, from his
intercourse with De Wette, a fresh impulse to the

Digitized by Google
HAGERSTOWN—HAGGAL.

development of his theological opinions. Appointed soon to an extraordinary professorship, he was raised in succession to the position of ordinarius professor. He delivered to public audiences beyond the university, and has since published through the press, several courses of lectures on the Nature and History of the Reformation (Wessen u. Gesch. d. Reformation, 6 Bde., 1834—1835; 4te Aufl., 1853—1856); on the Early History of the Church (Aeltere Kirchengesch., 2 Bde., 1855—1857), and on the Church History of the 18th and 19th Centuries (Kirchengesch. 18 u. 19 Jahrh., 2 Bde., 2te Aufl., 1846—1849). His tabular view of the History of Dogma, published in 1828, is highly praised, and his compend of the same department of historical theology (Lehrbuch d. Dogmengesch., 2 Bde., 1840—1841; 4te Aufl. 1858) has been translated into English. His Encyklopädie u. Methodologie d. Theologischen Wissenschaften is one of the most useful manuals for the student of German theology, and its popularity in the author's own country has already called for five editions. A number of the principal collections of Sermons, a Memorial of De Wette, and a work on Religious Education in the Gymnasium, have also come from his pen; and he has given proof of his poetical talents in two small volumes of poetry, and the collection of poems entitled Luther u. sein Zeit.—Of H.'s brothers, Johann Jakob has gained distinction as an entomologist, and Eduard as a physicist.

HAGGADA. (Heb. from nagad, hasten, to say, relate) is the free, rabbinical interpretation of Scripture, chiefly for homiletical purposes. As its name signifies, Haggadah was something 'said' (not 'received,' like the authoritative Halacha) (q. v.): legend, saga, tale, gnomes, parable, allegory; in fact, poetry springing up from the sacred soil, wild, luxuriant, and entangled like a primeval forest. On its three principal directions—the PesParticipants or hermeneutical investigation, Dericht or practical application, and Lod or mystical illustrations—we cannot dwell here, nor can we follow Zunz's minute divisions of Haggadah into: 1. Targumim; 2. Haggadot in Geonic literature; 3. Haggadot in Rabbinical Haggadot; 4. Historical Haggadot; 5. Secret esoteric doctrine; 6. Special Haggadot. It flowed in an uninterrupted stream for more than a thousand years—from the Babylonian exile to the 10th c. a. d.—and its innumerable authors are either entirely anonymous or at best pseudonymous. It grew into immense dimensions, as, although orally delivered, parts of it were gradually added in the shape of marginal notes or glosses to Bible MSS., or were committed to writing in the shape of independent collections. These either followed the order of the Scripture, and were called after the special biblical book around which they had woven their fabric, or they were arranged and called after the Sabbath, holidays, and festivals of the ritual, etc. They stand on the list of the principal collections of oral tradition. The most extensive collections, originally composed of single fragments, which have survived are Midrash Rabbath (commenced about 700 a. d., concluded about 1100 a.d.), comprising the Pentateuch and the five Megillot, and the Pesikta Rabbah (about 700 a.d.), which contains the most complete cycle of pericopes. Strange enough, this latter itself had, through the many extracts made from it in an early period (D'Entremon, Pesikta, Rabbaner, Sabbath, etc.), fallen into oblivion since the 15th c., until Zunz, in his Die Gottesdienst. Forträge der Juden (Berlin, 1832), not only proved its existence by evidence in the thirteenth, but published fragments and parallel passages; and about the same time, the old MS, which agreed with Zunz's statements to the minutest details, was found by Steinschneider at Oxford.

For the purpose of the Haggada, its language, its sources, and its development, no less than its vast influence on Christianity and Mohammedanism, and its immense usefulness for historical and theological investigations, the reader is referred to the articles Midrash and Talmud.

Haggadah shel Pesach is the name of a ritual, partly in Hebrew, partly in Chaldean, used on the two first evenings of the Passover, which contains, besides a brief description of the exodus, extracts from the Scripture, the Mishna, Tosaphot, Mechiltha, Sifri, and the two Talmuds, and some liturgical pieces. Originally within a very small compass, it has been extended to its present larger size by subsequent extracts from the minor prophetic books of the Rabbinical Talmud, and also from the Church Fathers, who prophesied in Palestine after the Babylonian captivity. Of his own history, nothing positive is known. It is related that he was born in Babylon, of priestly lineage, and came to Jerusalem at a very early age. The Church Fathers state that he had been one of the exiles who had returned with Zerubbabel and Joshua; and Ewald infers from i. 3, that he was one of the few who had seen the first temple, in which case he must have been a very old man when he composed his book. Between the time of his prophecies, however, is known with accuracy to fall in the 6th, 7th, or 8th month of the second year of Darius Hystasias (cf. Ezra, v. 1; vi. 14; Haggai, iv. 24) = 520 be. Fifteen years had then elapsed since the foundations of the new temple had been laid; but during the reign of Cambyses and Pseudo-Smerdis, the work had been neglected, and even the most zealous men began to think that the time of the re-establishment of the temple sanctuary was not yet at hand. Suddenly, H. presented himself before Zerubbabel and Joshua the high-priest, and strongly urged the re-establishment of the temple sanctuary, pointing at the same time to the suffering of the people, their want, their need for the sanctuary. He said: the people, the sanctuary, not of that of God. His words made a deep impression, and the building was recommenced (i.). The second discourse of the prophet—about a month later—of which still greater glory to the new temple than had belonged to the former (ii. 3—9). Two months afterwards, he had to renew his reproaches against their inertiess, and his promises of a blessed future (ii. 10—19). The fourth prophecy (ii. 20—23), delivered on the same day, is directed to Zerubbabel, and foretell great revolutions and political changes; but he, Zerubbabel, shall remain a 'signet' in the hands of God—i.e., the Jews and their princely leaders would not be harmless.

The style of H. is prosaic, and labors under an uncommon tameness and poverty of expression, principally apparent in the frequent repetition, within the short space, both of the same words and phrases, which could not well have been purposely retained for the sake of ornamentation (Eieh. Einl., s. 899). There is hardly any parallelism; but the prophet has endeavored to impart a certain dignity to his writing by means of occasional metaphors. The direction itself is, generally speaking, pure and
HAGHIE—HAHNEMANN.

clear. His name appears joined to that of Zechariah in some of the inscriptions of the Psalms (127 and 145—148 in lxx., 125, 126, 145—148 in Peshito, 111 and 145 in Vulgate), a circumstance which must point to the existence of an old tradition about these prophets having striven for the re-establishment of the music and singing of the psalms in the temple. Some critics suppose our present book of Haggaí to be simply an epitome of some lost and well-cultivated portion of H.'s orally delivered prophecies. However this may be, they have certainly not gained in strength by any such compression, as must well have been presumed.

HAGHE, Louis, a well-known water-colour painter of the present day, was born in Belgium in 1802, but settled in London at an early age. He first acquired a reputation as a lithographer, his most splendid lithographic work being Roberta's 'Sketches in the Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia.' Not less superb were his lithographs of his own drawings of old Flemish interiors. Subsequently, he devoted himself to painting in water-colours, became a leading member of the association formed to promote this branch of art; and in the exhibitions of this Society, his productions have always been very successful and extremely attractive. H. displays a decided predilection for the scenery and history of his native land. Among his pictures may be mentioned the 'Palace of Courtray,' and the 'Audience Chamber at Bruges,' which are remarkable for their harmony of colour, fidelity in detail, and richness of architecture. He obtained a gold medal at the Paris Exhibition of 1855.

HAGIOGRAPHY. See Bible.

HAUGE, or THE HAGUE (Dutch, Gravenhage), the capital of the Netherlands, and the residence of the king, is a pleasantly situated, well-built town in South Holland. Pop. (in 1860) 50,000. It is intersected in all directions by canals, and shady avenues of linden-trees, and abounds in palaces, public buildings, and stately houses. It has a good public library, containing 100,000 volumes, and noble galleries of paintings, the choicest of which, containing some of the most precious chefs-d'œuvre of the Dutch school, is in the palace of the present king. The town contains 14 churches, the most notable of which is that of St. John, founded in 1398, and distinguished for its lofty hexagonal tower with a peal of 38 bells. H. is the seat of the second chamber of the states-general, and of various tribunals and public offices, in one of which are deposited the archives and state papers which have been preserved by the republican and regal governments of the country for 400 years. In a historical point of view, the most interesting buildings of the H. are the Gevangenpoort, or the prison gatehouse, in which Oldenbarnevelt, the brothers De Witt, and many others distinguished in the history of Holland, have at different periods been confined; the Binnenhof, in which the former of these patriots was executed, and which, together with the Buitenhof, forms an irregular group of buildings of various ages, enclosed by moats, and approached by draw-bridges. Besides the various palaces within the H. itself, which are appropriated to the residence of different members of the royal family, or to the preservation of various national collections of interest, the most notable of which is the Mauritius House, containing a splendid collection of pictures by the Dutch masters, the palace known as the Huis (The House in the Wood), which lies on the outskirts of the town, in the midst of a noble wood, is specially worthy of notice for the frescoes and other paintings which it contains by Rubens, who, in conjunction with several of his most distinguished pupils, painted the ceiling and walls of several of the apartments. The H. is essentially a city of fashion and diplomacy, and depends for its prosperity almost solely on the court and nobility, having no trade, and few manufactures of any kind beyond some few of the most obvious, such as iron-smelting, sugar-refining, and several factories for gold and silver wares. The environs of the town are covered with hand some country-seats, surrounded by fruitful gardens and cultivated fields; and a combination of the two is admirably exhibited in the chateau of the dukes of Nassau, at Ruyseck, where Huntleigh signed there in 1697, and Schevingen, a famous bathing-place on the sea-coast, two miles from the town, with which it is connected by a broad causeway, planted with rows of trees. The origin of the H. is very ancient; but as far back as 1295, William, Duke of Holland and Emperor of Germany, erected a hunting-seat there, on the site of an older residence of his predecessors. In the 16th c., it was the seat of government of the states-general; and in the next century, it became the birthplace of many distinguished members of the House of Orange, and amongst others, of William III. of England; while, as the residence of the stadtholders, it was naturally the centre of the numerous state negotiations of European diplomacy, with which they were associated. The H. is connected by a railway with Amsterdam, 36 miles north, and Rotterdam, 13 miles south.

HAGUEKAV, a pleasant French town, in the department of Bas-Rhin, and formerly a free town of France and a strong fortress, is situated on the Moder, 18 miles north-north-east of Strasbourg. It was founded in 1164 by Frederic Barbarossa, and, as it was intended for the reception of the imperial insignia, it was strongly fortified. It successfully withstood many sieges, especially during the Thirty Years' War; but on its occupation in 1675 by the imperialists, its fortifications were destroyed. On the 17th October and the 22d December 1783, bloody battles took place here between the French and Austrians, in which the former were the victors. H. is a place of considerable manufacturing industry. Pop. 7123.

HAHNEMANN, Samuel, a celebrated German physician, was born in April 1755, at Meissen, a small town in the neighbourhood of Dresden, the capital of Saxony. His father—a merchant—had for many years been at Dresden under a constitution of law, and endeavoured to follow his occupation, but the boy displayed so ardent a love of letters that the head-master of the college (Friedrich Schwabe) of Meissen afforded him gratuitously all the advantages of that institution, and he remained at it till he was 20 years of age. He then left Meissen, with 20 crowns as his whole fortune, and went to Leipzig, to prosecute his medical studies. Here he maintained himself by translating works out of Latin, French, and English into German. By his industry and frugality, he saved enough of money to enable him to visit Vienna, where, under the direction of Dr Quarini, he pursued his studies, and after various vicissitudes of fortune, he returned to Saxony, and settled in Dresden in the year 1784.

Here he discovered a new salt of mercury, known by the name of Mercuration Solubilis Hahnemanni, and still extensively employed by physicians in Germany. He also published a monograph upon arsenical poisoning, which is distinguished by such accuracy of observation and clearness of diction as to be quoted with approval by Christian and other modern toxicologists. After spending several years in Dresden, where he had for a time the direction of a large hospital, he returned in the year 1789 to Leipzig. In the following year, while translating Oudem's Materia Medica out of English into German,
HAHN-HAHN—HAIL, HAILSTORM.

his attention was arrested by the insufficient explanations advanced in that work of the cure ofague by cinchona bark. By way of experiment, he took a large dose of that substance, to ascertain its action on the healthy body. In the course of a few days, he experienced the symptoms of ague; and it then occurred to him that perhaps the reason why cinchona cures ague is because it has the power to produce a healthy person similar to those of remedial ague. To ascertain the truth of this conjecture, he renounced the records of medicine for well-attested cures effected by single remedies; and finding sufficient evidence of this fact, he advanced a step further, and he published an article published in Hahn's Journal, in the year 1797, to apply this new principle to the discovery of the proper medicines for every form of disease. Soon afterwards, he published a comprehensive statement of his method. It was one of a very severe kind of colic cured by a strong dose of Veratum album. Before this substance gave relief to the patient, it excited a severe aggravation of his symptoms. This induced him, instead of drops, to give the fraction of a grain, or grain, and he thus introduced infinitesimal doses. Some years later, he applied his new principle in the treatment of scarlet fever; and finding that belladonna cured the peculiar type of that disease which then prevailed in Germany, he proceeded to give a medicine as prophylactic, or preventive against scarlet fever. From that time it has been extensively employed for this purpose. In the year 1810, he published his great work entitled Organon of Medicine, which has been translated into all European languages, as well as into Arabic. In this book he fully expounded his new system, which he called Homoeopathy. See Homoeopathy. His next publication was a Materia Medica consisting of a description of the effects of medicines in persons in health. These works were published between the years 1810 and 1821, at Leipsic, where he founded a school, and was surrounded by disciples. As his system involved the administration of medicines, each separately by itself, and in doses infinitely minute, there was no longer any need of the apothecary's intervention between the physician and the patient. In consequence of this, the Apothecaries' Company brought to him an act forbidding physicians to dispense their own medicines, and with such effect that he was obliged to leave Leipsic. The Grand Duke of Haukht-Kothen appointed him his physician, and invited him to live at Kothen. Thither, accordingly, he removed in the year 1821, and there he prepared various new editions of his Organon and new volumes of his Materia Medica for publication. In 1835, he married a second time; his wife was a French lady of considerable position; and in the same year he left Kothen, and settled in Paris, where he enjoyed a great reputation till his death, which took place in the year 1843. On the centenary of his birth-year, in 1855, a statue was erected to his honour at Leipsic, at the expense of his disciples in Germany, France, England, and other countries, with the concurrence of the local authorities, who supplied the site in one of the public places in their handsome town.

Hahn-Hahn, Ida, Countess, daughter of Karl Friedrich, Count von Hahn, a well-known author, was born at Tresow, in Mecklenburg-Schwerin, 22d June 1803. At the age of 21, she married a relative of her own; but the union proving unhappy, was dissolved in 1829. The lady sought consolation in poetry and travel, and visited Switzerland, Vienna, Italy, Spain, France, and finally Syria and the East. In 1830, sick of her restless and unsatisfactory mode of life, she embraced Roman Catholicism, and two years later, entered the mother-house of the Order of the Good Shepherd in Angers. Her writings, consisting of poems, novels, and voyages, are voluminous, and are generally marked by morbid sentimentality and aristocratic prejudice. She is sometimes clever, and even brilliant, but always superficial. Several of her novels of love and romance have been translated into English, and it may be observed between two others comparatively warm.

But that true hail, though the process of its formation is not yet perfectly understood, depends mainly upon the meeting of nearly opposite currents of hot and saturated vapour, the other very cold—is rendered pretty certain by such facts as the following. A hailstorm is generally a merely local phenomenon, or at most, ravages a breadth of country; it is not spread evenly, and rarely, if ever, follows a thunder-shower. A common idea, which has found its way, as many popular prejudices continually do, into scientific treatises, assigns electricity as the origin of hail. But no electrical agency, right or wrong, can allow that electricity and hail are results of the same combination of causes.

When a mass of air, saturated with vapour, rises to a higher level, it meets a current of cold air, and condensation of ice by the cold due to expansion; at the same time, there is generally a rapid production of electricity, the effect of which upon such light masses as small hailstones is to give them in general rapid motion in various directions successively. These motions are in addition to the vortex motions or eddies, caused in the air by the meeting of the rising and descending currents. The small ice-masses then move in all directions impinge upon each other sometimes with great force, producing that peculiar rattling sound which almost invariably precedes a hail-shower. At the same time, by a well-known property of ice (Expansion), the mass of water frozen together and the process continues until the weight of the accumulated mass enables it to overcome the vortices and the electrical attractions, when it falls as a larger or smaller hailstone. By examining such hailstones, which may have any size from that of a pea to that of a walnut, or even an orange, we at once recognise the composite character which might be expected from such a mode of aggregation. Hailstones are reported to have fallen in tropical countries sometimes as
large as a sheep, sometimes as large as an ox, or even an elephant! But it is probable that the aggregation in these cases was produced by regulation at the surface of the earth, when a series of large masses had impinged on each other, having 'climbed successively on the same spot. Whether this be the true explanation or no, it is certain that in British India, at the warmest season, hailstones have remained of considerable size for many days after they fell. A certain instance of the fall of large hail, or rather ice-masses, occurred on one of Her Majesty's ships off the Cape in January 1860. Here the stones were the size of half-bricks, and beat several of the crew off the rigging, doing serious injury.

We may conclude by a description (taken from *Mem. de l'Acad. des Sciences, 1790*) of one of the most disastrous hailstorms that has occurred in Europe for many years back. It illustrates very happily the greater part of what we have said about the origin of this meteor. This storm passed over parts of Holland and France in July 1788. It travelled *simultaneously* along two lines nearly parallel—the eastern one had a breadth of from half a league to five leagues, the western of from three to five leagues. The space between was visited only by heavy rain; its breadth varied from three to five and a half leagues. At the outer border of each, there was also heavy rain, but we are not told how far it extended. The general direction of the meteor was from south-west to north-east. The length was at least a hundred leagues; but from other reports, it may be gathered that it really extended to nearly two hundred. It seems to have originated near the Pyrenees, and to have travelled at a mean rate of about sixteen and a half leagues per hour towards the Baltic, where it was lost sight of. The hail only fell for about seven and a half minutes at any one place. The hailstones were generally of irregular form, the heaviest weighed about eight French ounces. This storm devastated 1039 parishes in France alone, and an official inquiry fixed the damage at about 24,089,000 francs—nearly a million of English money.

HAIMHALDARE, an old Scotch law-term, meaning to recover one's goods and bring them home again—now disused.

HAIMSUCKEN, or HAMESUCKEN, a Scotch law-term, denoting the offence of feloniously assaulting a man in his own house or lodging. This was an aggravation of the ordinary offence of assault. It was not so in England, where there is no peculiarity in distinguishing this from other assaults.

HAIMURA (*Erphythrus macrodont*), a large fresh-water fish of Guiana, highly esteemed for the table.
we find it rooted in a follicle in the cutis or true skin, or even in the connective or cellular tissue beneath it. This follicle is bulbous at its deepest part, like the hair which it contains, and its sides are lined with a layer of cells continuous with the epidermis. The layer (b) in fig. 1, according to Todd and Bowman (Physiological Anatomy, vol. i. p. 417), ‘resembles the cuticle in the rounded form of its transverse lines which are seen on examining a hair under the microscope.

In some hairs, especially those which act as tactile organs some of the lower animals (as, for instance, in the whiskers of the various cats), a true papilla, furnished with nerves and capillaries, projects into the hair-bulb, and an approach to this papillary projection may often be seen in human hairs.

The hairs, like epidermis, are thus seen to be organised, and to maintain a vital, although not usually a vascular connection with the body. The colour of hair seems to depend on the presence of a peculiar oil, which is of a sepias tint in dark hair, blood-red in red hair, and yellowish in fair hair. This oil may be extracted by alcohol or ether, and the hair is then left of a grayish yellow tint. The chemical composition of hair closely resembles that of horn, and will be described in the article Hony Tissue.

Hair is extremely strong and elastic, and hence its uses for the construction of fishing-lines, the stuffing of cushions, balls, &c. Amongst its other physical properties, we may mention that, when dry and warm, it is easily rendered electrical, and that it is extremely hygroscopical; readily attracting moisture from the atmosphere, and no doubt from the body also, and yielding it again by evaporation when the air is dry. Hair will eliminate very considerably the moisture—a property of which Saussure availed himself in the construction of his hygrometer, in which a human hair, by its elongation and contraction, according as the atmosphere is moist or dry, is made to turn a delicate index.

Hairs are found on all parts of the surface of the human body, except the palms of the hands and the soles of the feet; they differ, however, extremely in length, thickness, shape, and colour, according to situation, age, sex, or race. The differences dependant on situation, age, and sex, are so obvious that we shall pass them over without notice, and proceed to the most important differences dependent on race. With respect to the quantity of hair that grows on the human body, there are great differences in different races. The Mongols, and other northern Asiatics who are similar to them, are noted for the deficiency of their hair and for scanty beards, and the same character is ascribed to all the American nations; while, on the other hand, among the Ainos, or in the Kurilian race, there are individuals who have the hair growing down the back, and covering nearly the whole body. The northern races, especially the Americans have generally straight lank hair, while Europeans have it sometimes straight and flowing, and occasionally curled and crisped. Negroes present every possible gradation, from a completely crisp, or what is termed woolly hair, to merely curled, and even to flowing hair; and a similar observation holds regarding the natives of the islands in the great Southern Ocean. As there is a generally diffused opinion that the head of the African is covered with a species of wool instead of with true hair, we may mention that all true wool which have been examined microscopically (as merino wool, the wool of the tiger, rabbit, bear, seal, and wolf-dog, which were investigated by the late Mr Youatt), present a more or less sharply serrated or jagged surface, while hairs present merely an imbricated appearance. This characteristic of wool is shown in fig. 3, where a represents a fibre of merino wool, whereas b is a transparent, and c an opaque object, &c.

Hairs of a negro, of a mulatto, of Europeans, and of some Abyssinians, sent to me (says Dr Prichard) by M. d'Abbadie, the celebrated traveller, were, together with objects of a south-west native of the Cape, both as transparent and opaque bodies. The filaments of wool had a very rough and irregular surface.
HAIR.—HAIR-DRESSING.

The length to which the head or the hair may grow normally, especially in women, is very considerable. In the 'Hair Court' of the International Exhibition (1862), there was a beautiful specimen of jet-black hair (British, we believe) measuring 74 inches.

Cases occasionally occur where there is an abnormal abundance of hair of considerable length in women, on parts where the hair is usually little more than down. A lady of the name of Chadwick, supposed to be a Negro, was a few years ago exhibited in London. Her emblazoned body is now (1862) being exhibited in that city, and we extract the following remarks from a memoir on her in The Lancet for May 3: 'The ears, and all parts of the face except the eyes, were covered with hair of different lengths. The beard was tolerably thick, the hairs composing it being straight, black, and bristly, the part of it which grew on the sides of the chin hanging down like two plaits. . . . The upper portion of the back of the neck and the hinder surface of the ears, were covered with hairs. On the shoulders and legs, the hairs were as abundant as they are occasionally seen on very powerful men.'

Dr Chowne has described similar but less marked cases of hairy women in The Lancet for 1842.

HAIR-DRESSING. As a matter of convenience, as well as of taste and fashion, the dressing of the hair has received much attention in all civilised nations, ancient and modern. The growth of hair on the sides and back part of the male face has caused some perplexity in management, and as a method of overcoming the difficulty, shaving has been resorted to, although at the sacrifice of what nature gives to distinguish the male from the female; and also to protect the respiratory organs. See BEARD. The Jews, by their scriptural law, were enjoined not to shave. The Romans shaved, and so did their immediate successors, the Romanized Britons. Tweeds covered with hair of different lengths. The beard was tolerably thick, the hairs composing it being straight, black, and bristly, the part of it which grew on the sides of the chin hanging down like two plaits. . . . The upper portion of the back of the neck and the hinder surface of the ears, were covered with hairs. On the shoulders and legs, the hairs were as abundant as they are occasionally seen on very powerful men.'

HAIR DYES—HAIR MANUFACTURES.

balls, ladies' hair had to be dressed one or two days in advance; and to keep the head-dress uninjured, the lady sat in a chair perhaps two nights, instead of going to bed. The writer of this has conversed with a lady who in this manner sat up one night for the sake of her finely powdered and frizzed-up hair. A taxation on hair-powder, along with the simplifications in fashion consequent on the French revolution, not only expelled hair-powder and perukes, but brought the profession of hair-dresser within reasonable bounds. As regards ladies' hair, fashion now seems to alternate between braids and curls, though on this, as on various other points, it would be well that each lady studied that which would be most becoming to her person and complexion. With respect to men's hair, short cutting is now universal, and any indulgence in long hair behind is thought to mark a degree of slovenliness or whimsicality of fancy. Pursued as an ordinary business in England and continental countries, hair-dressing in the United States is entirely resorted to men of colour, and in connection with many of the houses they are provided with dressing rooms.

Innumerable are the oils, essences, and pomades which are vended for the hair, on the assumption that they improve and nourish it. According to the experience of the best physicians, such applications, any unguent in particular, and however sanctioned by tradition, are injurious. In ordinary circumstances, regular but not violent brushing is preferable for maintaining cleanliness and glossiness. When the head becomes affected with scurf which the brush does not remove, let the following efficacious and simple method of purification be adopted. Beat up an egg, and rub it well in all over the head; then pour over it warm water, which, while removing the scurf, also carries away the scurf; lastly dry thoroughly with a cloth. The head may be hung over a small tub during the process. After this, the hair will be very clean, and will take on a fine gloss with a brush. On no account use sharp combs to clean the head, for they are apt to irritate the roots of the hair, and after all fail in the desired object.

HAIR DYES. Various means have been adopted for changing the natural colour of the hair to a more favoured one, and for hiding the approaches of age, as indicated by the presence of grey hairs. These usually consist in washing the hair with a solution of some metallic salt known to have the effect of darkening its colour. These are the salts or oxides of silver, mercury, lead, and bismuth. The manner of preparing the hair for the use of dyeing them is that of previously preparing it by a complete soaking with a solution of sulphide of potassium; the strength of this solution must depend on the depth of tint intended to be given; the stronger the solution, the darker the colour will be. When thoroughly wetted, the hair is allowed to dry partially; and whilst still damp, it is to be again thoroughly wetted with a solution of nitrate of silver, also proportioned in strength by the same rule as in the case of the solution first applied. This makes a very permanent dye, which only requires renewing as the new growth of hair becomes conspicuous. The fashion of dyeing the hair is very ancient, and belongs as much to civilization as to civilizations; but the case of the former, vegetable dyes have been chiefly used; and the ladies of China and other eastern countries also resort to the same: the juice of the petals of Hibiscus Trionum, of the Bladder Kettia, and probably other species of Hibiscus, is in general use with them.

The detection of stained hair is sometimes an object of medico-legal investigation. Lead may be detected by boiling the hair in dilute nitric acid, and then applying the tests for Lead (q. v.) to the acid solution; while the presence of silver may be shown by digesting the hair in dilute hydrochloric acid or chlorine water, when the resulting chloride of silver may be shown, and submitted to the ordinary tests for Silver (q. v.).

HAIR GRASS (Aira), a genus of grasses, having loosely paniced flowers, and two unequal glumes containing two perfect florets, each with two thin membranous palis, of which the outer is generally awned near the base. The species are native to cold regions, and cold climatic conditions of the countries of which the inhabitants are natives, some of which are of very humble growth, and are chiefly found in moors, sandy pastures, and other situations where the soil is sterile. The Tufted H., or Terry H. (A. caespitosa), common in better pastures and meadows, is a beautiful grass when in flower, but forms coarse tufts; has very rough leaves, which, if drawn roughly across the hand, inflict considerable wounds, whence the plant sometimes receives the name of 'Cutting Grass.' It is rejected by cattle, if other herbage is within their reach. It attains a height of 2—4 feet, and is sometimes used for thatching ricks of hay or corn, and in some places for covering roofs of thatch. It grows wild in most situations, and indicates a soil in want of draining. It is sometimes tolerated, in order to add to the bulk of Bog Hay in moorish grounds, but is carefully extirpated wherever agricultural improvement takes place. For its extirpation, drainage is requisite above all things; but the digging out of the tufts is also practised, and other grasses are sown instead. This grass is, however, sometimes sown to form cover for game, particularly hares; and in marshy situations, for snipes and wild fowl. It is the windlterace of the Scotch.—Allied to the genus Aira is Catabrosa (q. v.).

HAIR MANUFACTURES. These consist of fabrics woven or felted of various kinds of hair; brushes made of particular kinds of hair; and ornamental hair-work.

Woven Fabrics.—The most important in this country is the horse-hair cloth so extensively used for covering the seats of chairs, couches, and other articles of furniture; this is made of the long hair of the horse. As the hair of so many colours, it is necessary to dye all the darker shades so as to produce a uniform glossy black; this is done by logwood and sulphate of iron (coppears) in the following manner. The hair must first be cleansed, and deprived of its grease, by soaking it in lime-water for a day; it is then transferred to the dye-vat, which is thus prepared for a hundredweight of hair. Sufficient water to fill a boiler large enough to receive the hair, is boiled with 60 lbs of cold logwood for three hours, after which it is suffered to cool, when 2 lbs of copperas are added. This constitutes the bath, as it is called; and the hair, after being removed from the lime-water, and well washed in a large vessel of water or river, is immersed in it for 24 hours; it is then removed, and again washed, to free it from the superfluous dye, dried, and shaken out ready for use. Perfectly white horse-hair can be dyed various colours, and is well adapted to be dyed in addition to the hair, used for grey hair. As the case of the former, vegetable dyes have been chiefly used; and the ladies of China and other eastern countries also resort to the same: the juice of the petals of Hibiscus Trionum, of the Bladder Kettia, and probably other species of Hibiscus, is in general use with them.
HAIR MANUFACTURES.

worsted, cotton, or linen yarn, generally the last. The hairs for the weft are kept wet by the side of the weaver, and are handed to him one by one. He receives them on a kind of hook at the end of his hand, which can be adjusted to the size of the attendant child who hands the hair. In other respects, the weaving differs little in its general character from that ordinarily employed for other fabrics. When the web is completed, it is dressed by calendering, a process which belongs chiefly to the

trade and is not peculiar to any one country. The hairs, usually the white kind; but the immense demand led to the introduction of Agave or Aloe fibre, which soon supplanted it for most purposes, except the manufacture of bonnets, for which it is largely employed both as a material for the body of the bonnet and also as a trimming. The trade in crinoline trimming in Switzerland and France is large, and considerable quantities are imported, also cow hair and the other kinds of Persian hair, are twisted into ropes, which, after being boiled and then thoroughly dried in an oven, are pulled to pieces. The hair retains the twist given it, and is then used for stuffing seats of chairs, &c.

Artists' brushes are of various kinds; some are made of the stiff hairs from the backs of pigs, and others are made of the soft hairs of the camel and other animals. The hairs for the first kind are called bristles (see BRISTLES), which constitute an important trade with foreign countries. They are chiefly used in the manufacture of hair and clothes brushes, tooth and nail brushes, house-sweeping brooms, the larger kinds of painters' brushes, &c. The second kind are chiefly employed in the manufacture of the fine brushes or hair-pencils used by painters and artists. The best bristles come from Russia. Besides the camel, hairs, are yielded for this purpose by the badger, sable, goat, dog, &c. In both cases the hairs are taken, and will be treated of in the next paragraph. It is a very important and troublesome matter. Generally, it is done by placing the hairs in small boxes (with the tips upward), sufficiently deep to keep them upright; and the sorten then, with nice eye and hand, selects the sizes, by pulling out all the longest, as they overtop the others; then the next size, and so on. This, in the case of the hairs for artists' pencils, is an extremely difficult operation, as great exactness is necessary. Several attempts have been made, in Russia and in this country, to sort bristles by machinery, and one person has succeeded in doing so with a rude wooden machine. But the really successful manufacture of a machine which can be used on a large scale, belongs apparently to Mr. W. S. Yates of Leeds, who exhibited in the International Exhibition (1862) a machine of great beauty and simplicity, which sorts into ten sizes, and with great rapidity.  

Most hair-brushes are required to be made with the bristles or hairs placed with great evenness, so as to form a flat surface outward; but in the case of those which are called artists' and painters' pencils, their value consists in having a fine point, so that the selection of the hairs so as to produce this, is a work of difficulty. The first step is, after selecting a small quantity, to see that all the tips are in one direction; this is usually done in removing them from the skin, a pair of flat-bladed scissors being employed to hold each cut of hairs, whilst the knife or shears sever them from the skin. They are then placed in small shallow tin boxes, with the tips upward; and the box being carefully closed, and gently struck on the bottom until the hairs have been completely arranged, or mounted in an upright position, they are then picked out, as before described; each size is placed by itself; and the brushmaker, according to the kind of pencil he is making, takes the proper size or sizes, according to the number, and steps round the base of the little bundle of hairs, and securely tied; sometimes more than one ligation is thus made; and the brush, now so far completed, only requires its handle of quill or wood, according to its size and character; and then the hair is shaped, so as to suit the purpose. Various kinds of handles are required. These are obtained from several birds, as the swan, goose, duck, fowl, pigeon, lapwing, and even such small ones as the jack and thrush. Previous to receiving the brush, the quills, besides being cut to the required length, have to be further prepared by soaking in water, to prevent them splitting, as the thick end of the brush is generally the wider, and the thinner the end. They also contract somewhat in drying, and consequently hold the brush very tightly.

Ornamental Hair-work consists chiefly of the human hair plaited into chains, guins, &c., or worked up into various other fanciful devices, as souvenirs, &c. Under this head we may also mention those manufactures of the human hair which are either required to supply a personal deficiency, or to meet the demands of fashion. To the former class belong the wig, the front, and other imitations of the natural covering of the human head; and to the latter, a variety of contrivances, whose mysterious names are only known to barbers and ladies' maids, for the purpose of giving an appearance of greater abundance to the natural supply. The wig, like all other portions of human attire, has undergone a great many variations in fashion. In the present day, the great object is, in the first place, to rival in costliness, and in the second, to rival in beauty of form, and to deceive the eye; and secondly, to produce wigs of extreme lightness—a full-sized peruke rarely being more than two or three ounces in weight. A full head of hair, from a young woman's head, will sometimes weigh five or six ounces. There are two heads of hair in the South Kensington Museum, which are in the raw state as imported, and weigh together 11½ ounces.

The chief portion of the hair used in Great Britain
HAIR-POWDER—HAIR.

is received through French dealers, who collect it from Holland and Germany, as well as from the various departments of their own country. The light colours are usually obtained from the former countries, and the dark shades from Brittany. This does not arise from the circumstance that these countries yield the finest heads of hair, but because the gale, that is the people causes its sale to be a matter of importance, and the peculiar fashions of the country head-dresses render its loss of less consequence.

The wholesale price of long hair is from 30s. to 60s. per lb., and the peasants of France alone supply 20,000 lbs., of the value of £40,000. The average imports, during the last four years from France, has been 14,000 lbs., of the value of £28,000. Besides the imports from France, which chiefly comprises the darker colours, a considerable quantity comes from Germany, usually of light shades.

HAIR-POWDER, a pure white powder, made from pulverised starch, scented with violet or some other perfume, and at one time largely used for powdering over the head. The strange fashion of using hair-powder is said to have originated from some of the ballad-singers at the fair of St Germain, in France, whitening their heads, to render themselves more attractive. Introduced into Great Britain, the fashion became universal among the higher and middle classes, and by ladies as well as gentlemen. To make the powder hold, the hair was usually greased with pomade, and accordingly the fashion was extremely troublesome. An act of parliament fixed that the fine dust of which the powder was composed should be made from starch alone; and we learn from the Gentleman's Magazine, that on November 20, 1746, fifty-one barbers were convicted before the Commissioners of Excise at London, and fined £220 each, for having in their keeping hair-powder not made of starch, contrary to act of parliament; and on the 27th of the same month, forty-nine others were fined, for the like offence, in the same penalty. In 1785, a tax was first put on the use of hair-powder, and at one time yielded £20,000 per annum, but it had the effect of causing hair-powder to fall into general disuse. The French revolution, which overturned so many institutions, contributed also to the people of Europe returning to natural and unpowdered hair. When gentlemen first left off hair-powder with queues, they were considered very unfashionable; and the custom of having the hair cut short, or cropped above the ears, which is quite universal at present, was then deemed vulgar. Hair-powdering for many years has been indulged in only by a few old gentlemen, and even these adherents of the once prevailing fashion have almost disappeared. It is continued by some of the footmen of the nobility and higher ranks as part of their livery; and occasionally, at public or private balls costumés, ladies and gentlemen still appear with their heads powdered. The tax on hair-powder is £1, 3s. 6d., which in 1861 was assessed on 972 persons in England and Scotland, Ireland being exempt from the tax.

HAIR-SPRING. See BALANCE-SPRING.

HAIR-TAIL (Trichirius), a genus of acantho- terous fishes, which, on account of their compressed and very elongated form, have been classed in the Ribbon-fish family, but are otherwise allied to the mudskipper. They, as well as are therefore, in recent systematic works, referred to the family Scorpionidae. The dorsal fin extends along the whole back, and is spiny throughout; there are no ventral fins, no anal fin, and no tail fin, the tail ending in a short slender filament. One of these, the Silver-fish, (T. lepturus), sometimes called the Blade-fish, is

found in the Atlantic Ocean, and has been cast on the shores of Britain, but is more common in warmer regions. It is called Sabre-fish in Cuba. It sometimes attains a length of twelve feet. Its flesh is good.—An East Indian species, the Savala (T. Savala), is much esteemed for food, and commonly sold in the markets of India.

HAIRS, in Botany, are very different from the hair of animals, although there is sometimes a considerable general resemblance, and the same purpose of protection from cold and from various atmospheric influences seems also to be sometimes served by
HAJDUK—HAKE.

They are produced by no special organ analogous to the bulbs from which the hairs of animals grow, but are composed of cellular tissue, arise from the skin, and are contained within the epidermis and subcutaneous tissues, extending the cuticle. Some hairs consist of a single elongated cell; some of several cells placed end to end. The gradations are quite indefinite between the most elongated hairs and the mere wart or nigritas which often appear on the surface of plants. In like manner, hairs pass into bristles (setae) and prickles (aculeata), which are merely stronger and harder hairs; but spines or thorns are totally different, arising from the wood of the stem or branch. Hairs are very often connected with glands, which are cells or clusters of cells, producing secretions; hairs often arise from glands, and then generally serve as ducts through which the secretion may pass; but hairs also often bear glands at their apex. Stinging hairs, as in nettles, Locusts, and some Malphigias (see these heads), are ducts, with venom-secreting glands at their base.

HAJDUK (in ancient Latin documents, Hagdun) is the name for the population of a free district called Hajdu Kertés in the eastern part of Hungary. The H. are direct descendants of those warriors, who, during the long and bloody contest between the House of Hapsburg and the Protestant insurgents of Hungary, formed the nucleus of Prince Stephen Bocskay's turbulent armies. The H. enjoyed privileges of nobility, and immunities from taxation even after 1605, in which year the whole tract of land they are in possession of to the present day was given them by the above-named monarchs as a reward for their services. Notwithstanding repeated attempts made by the Austrian government against their privileges, the H. retained the peculiar organisation of their district, until after the disastrous issue of the struggle in 1848—1849, when they were reduced to the same level with the so-called hereditary provinces of the empire. At the dawn of the Reformations, the H. were among the first to adopt Calvin's doctrines (designated during a long period 'the Hungarian Faith,' in opposition to Luther, whose followers were chiefly among the Slavs of Upper Hungary). The H. are almost exclusively addicted to agriculture, and with the simplicity of manners unites all the qualities which distinguish their ancestors. Their population amounts to 70,000, forming six towns. The political chief of the district bears the title of Captain.

HAJLJ, or BITO-TREE (Balantia, Egyptica), a tree of the natural order Ampelisacre, a native of Egypt and of Central Africa, cultivated for its fruit, a drupe, which is edible, and from the seeds of which a fixed oil is expressed, called Zachun. So much is this tree valued in Central Africa, that there is a common proverb to the effect that a milch cow and a bito-tree are the same. (Barth's Travels.)

HAJJ (HAJI, HAGGE), (Heb. Hag, one of the three festivals appointed to the Jews for the purpose of pilgrimage to Jerusalem), Arab, pilgrimage, emphatically, pilgrimage to the Kaaba (q. v.) or Temple of Mecca, which every Mohammedan, male or female, whose means and health permit, is bound to perform, once at least in his lifetime; otherwise, he or she might as well die a Jew or a Christian. Mohammed, after many fruitless attempts to abolish altogether the old custom of pilgrimage—prevalent among most peoples in ancient, and some even in modern times, and perhaps arising from an innate, instinctive, travelling propensity, but is not unfrequently fraught with mischievous consequences—was compelled finally to confirm it, only taking care to annul the idolatrous rites, and to substitute the great number of ancient idols around Mecca. The 12th month of the Mohammedan year, the Duw. Hajjeh, is the time fixed for the celebration of the solemnities, and the pilgrims have to set out for their journey one or two months before (in Shawal or Dhulhikad), according to the respective distances they have to traverse. They first assemble at certain variously appointed places near Mecca, in the beginning of the holy month, and the commencement of the pilgrimage is made before first putting on the Ihram or sacred habit, which consists of two woolen wrappers—one around their middle, the other around their shoulders; their head remains bare, and their slippers must neither cover the heel nor the instep. It is enjoined that the pilgrims, while they wear this dress, should be particularly careful to bring their words and thoughts into harmony with the sanctity of the territory they now tread, a territory in which even the life of animals is to be held sacred from any attack. Arrived at Mecca, the pilgrims proceed at once to the temple, and begin the holy rites there by walking first quickly, then slowly, seven times round the Kaaba, starting from the corner where the black stone is fixed (Tawaf). This ceremony is followed by the Sai, or running, likewise performed first slowly, then quickly, between the two mounts Safi and Merwa, where, before Mohammed's time, the two idols Asaf and Nayelah had been set up. The next rite takes place on the ninth of the Duhl-hajja, and consists in the Wukuf or standing in prayer on the mountain of Arafat, near Mecca, till sunset. The whole of the succeeding nights are spent in holy devotions at Mogadilaa, between Arafat and Mina. The next morning, by daybreak, the pilgrims visit the Masier-al-Haram, the sacred monument (a place where the Prophet stood so long in prayer that his face began to shine), and then proceed to the valley of Mirra, where they throw seven (or seventy) stones at three pillars, for the purpose of putting the devil to flight. The pilgrimage is completed with the slaughtering of the sacrifices on the same day and in the same place. The sacrifice over, they shave their heads and cut their nails, burying the latter on the same spot. They then take leave of the Kaaba, and, taking with them some sacred souvenirs, such as dust from the Prophet's tomb, water from the well Zowma, &c., they proceed to their homes. The return of the holy caravans is watched everywhere with the most intense anxiety, and is celebrated with great pomp and rejoicings. Henceforth, the H. omits to prefix the proud name of Hajji to his name. It is permitted that those who, through bodily infirmity, are incapacitated from performing the holy journey themselves, may send a substitute, who acts as their representative in almost every respect, but this substitute has no share whatever in the merits and rewards belonging to the Hajj.

HAKE (Merluccius), a genus of fishes of the cod family (Gadidae), having a flattened head, an elongated body, two dorsal fins, of which the first is short, and the second very long, very long anal fin, and the mouth destitute of barbels. One species, the COMMON H. (M. vulgaris), is found in the British seas, in those of the north of Europe, and in the Mediterranean. It is sometimes three
or four feast in length; and is of a whitish colour, grayish on the back. It is a very voracious fish, devouring great numbers of herrings and pilchards; hence it is frequently called the Herring Hake. It is a coarse fish; its flesh white and flaky; but it is important as an article of human food and of commerce; being salted and dried in the same manner as cod and ling, in common with which it receives in this state the name of stock-fish. It is generally taken by lines, like cod and ling. In the spawning season, when it keeps near the bottom, it is sometimes caught by trawl-nets. Other species of H. are found in high southern latitudes.

HAKIM BEN ALLAH—HAKODADI.

HAKIM BEN ALLAH, or BEN HASHEM, eldest son of Agha Sagesh Nah (Moon-maker), the founder of an Arabic sect who first appeared in the 8th c., during the reign of Mahadi, the third Abassid calif, at Neksheb, or Meru in Khorasan. H. is said to have commenced his extraordinary career as a common soldier, but to have soon been promoted to a captaincy, and finally to have put himself at the head of a band of his own. In a fight, an arrow pierced one of his eyes, and in order to hide this deformity he henceforth constantly wore a veil, a habit attributed by other writers (lithodemir, &c.) to a desire to conceal his extraordinary ugliness—by his own followers, however, to the necessity of shrouding the dazzling rays which issued from his divine countenance. H. was a steely adherent; and his little band increased so rapidly, that ere long he was able to seize upon several fortified places near the cities of Neksheb and Kesh. Sultan Mahadi marched against him, and after a long siege took the last stronghold in which he had fortified himself, together with the remnant of his army. H., however, having first poisoned his soldiers with the wine of a banquet, threw himself into a vessel filled with a burning acid of such a nature that his body was entirely dissolved, and nothing remained but a few hairs: in order that the faithful might believe him to have ascended to heaven alive. Some remnants of his sect still exist, and their outward distinguishing badge is the white garb, which they wear in memory of the white garb worn by their dynasty, as a stanching token of opposition to the black colour adopted by the Abassid califs. H. has furnished the subject of many romances of which the one contained in Moore's Lalla Rookh is the most brilliant and best known.

HAKLUYT, or HAKLUYT, RICHARD, an English author, was born in 1553. While at Westminster School he eagerly pursued narratives of voyages and travels, and continued this course at Christ-church, Oxford, whither he proceeded in 1574. Being appointed lecturer on geography or cosmography in that university, he introduced the use of globes and other geographical appliances into English schools. Private individuals, as well as commercial companies and towns, consulted him respecting nautical enterprises. In the year 1584, he went as chaplain to the English embassy to Paris, where he had Lau’dunnère’s manuscript narrative of the discovery of Florida printed, first in French and afterwards in English, at his own expense. On the recommencement of Sir Walter Raleigh, he began to collect materials for the history of the discoveries made by his countrymen. He published the fruits of his researches, in notices of more than 200 voyages, under the title Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation, (Lond. 1589; new edit. 5 vols. Lond. 1809—1812). Government rewarded him by bestowing upon him a prebend in Westminster Abbey, and a living in Suffolk. A work entitled A Selection of Curious, Rare, and Early Voyages and Histories of Interesting Discoveries, &c., chiefly published by H., or at his suggestion, but not included in his celebrated compilation, it is to form a supplement to the above works. He died in 1616, and was buried in Westminster Abbey. H.’s unpublished manuscripts were made use of by Purchas, Hakluyt, and several other writers. An island in the Pacific was named after him by Bynon, and a promontory in Spitzbergen by Hudson. The Hakluyt Society, instituted in 1846, likewise took its name from him. Its object is the publication of all the histories of the earlier voyages and travels.

HAKODADI, the most northern of the opened ports of Japan, situated in 41° 40' N. lat., and 141° 18' E. long. The town stretches three miles along the base of a lofty promontory, which juts out into the Pacific, from the southern extremity of the island of Yesso. It is connected with the mainland by a low alluvial isthmus, and separated from the mountainous region to the north by a plain bordered by an amphitheatre of hills. The adjacent scenery is striking and picturesque, and closely resembling that of Gibraltar. H. was ceded to the Tycoon by the Prince of Matsumai in 1854. It was then a poor fishing-village, but is likely to become a place of much political and commercial importance. It is at present a small place, having about 1000 houses of a single story, fragile wooden buildings with single roofs, which are retained in their places by cobble stones. Each house has on its roof a tub filled with water for use in case of fire. The country is warm before 30 and heavily laden with snow, clean, well drained, and macadamised. Considering the latitude of H., its climate is severe, and during its winter season the thermometer has been found to indicate 18° below zero. The observations of 1854 make its summer very nearly comparable to that of Edinburg. The snow disappears about the beginning of April (though it often lies on the mountains until midsummer); and torrents of rain, brought up from the Pacific by the south-west wind, quickly deluge the recently snow-dusted ground. H. is said not to be healthy, and yet longevity is frequent. The harbour is one of the finest and largest in the world, but difficult of access. It is divided by a natural barrier and an inner harbour; and fish and sea-weed are largely exported. H. maintains commercial intercourse with all the large ports of Japan, and more than 1000 junks may sometimes be seen in the harbour. It is valuable to foreigners chiefly as a place of resort for whalers. The whalemen, who find in the neighbouring seas a rich field for the pursuit of their calling, here obtain at a cheap rate supplies of potatoes, this important article of diet in those southern states, which have been recently cultivated with great success by
HALACHA—HALE.

HALACHA (Rule) is the general term for the Jewish oral law, which runs parallel with the written law contained in the Bible, and is supposed to be like this, of divine origin. Its relation to the ordinances contained in the Pentaconta is that of an amplified code to the fundamental, religious, and civil maxims—such as the changes wrought by time in the inner and outer relations of a rapidly increasing people. A need of necessity produced. Handled down through a long chain of highest authorities (Smaic revelation, Moses, Joshua, Elders, Great Synagogue [Ezra], &c.), it could only be treated and further developed by the foremost men of each generation—such, in fact, as through their minuteness in learning belonged to a kind of aristocracy of mind (Chachanim, Wise Men), towering above the multitude (Hediotim, idiots). Their decision on all ordinances involved in contradictory traditions was final, because it was believed to spring from the clear appreciation of Scripture. Often, indeed, they had recourse, in order to give their opinion a greater weight, to certain special letters, words, and even signs in the Scripture, which, seemingly superfluous where they stood, were supposed to point to the injunction under discussion. Halacha embraces the whole field of juridico-political, religious, and practical life, down to its most minute and insignificant details. Originally, as we said, the Oral Law, by way of handing on to successive legatees of the Sages when the sufferers, to which the Jews were almost unutterably subjected from the first exile downwards, had made many portions of it already very uncertain and fluctuating, and threatened finally to obliterate it altogether from memory. The first collection of laws was instituted by Hillel, Akiba, and Simon b. Gamaliel; but the final reduction of the general code, Mishna (q. v.), is due to Jehuda Halcsei, 220 A.D. Later additions to this code are formed by the Baraitah and Toseptah. Of an earlier date with respect to their contents, but committed to writing in later times, are the three books (Midrashim); Sifra or Thorath Kohanim (an amplification of Leviticus), Sifri (Shunmim, and Deuteronomy), and Mechilta (a portion of Exodus). The masters of the Mishnaic period, after the Sederim, are the Trammim. These were followed by the Amoraic, who, by discussing and further amplifying the Mishna, became the authors of the Gemara (q. v.), a work extend in two reductions—that of Palestine and of Babylon. The Halacha was further developed in subsequent centuries by the Saboraim, Geonom, and the authorities of each generation. See also MIDRASH, MISHA, TALMUD.

HALAS, a town of Hungary, in the district of Little Cumania, is situated on the lake of Halass, about 86 miles south-south-east of Pest. It has 12,750 inhabitants, who are employed chiefly in agriculture and the cultivation of the vine.

HALBERD, or HALBERT, a weapon borne, up to the close of the 15th c., by all sergeants of foot, artillery, and marines, and by companies of halberdiers in the various regiments. It consisted of a strong wooden shaft about 6 feet in length, surmounted by an instrument much resembling a bill-hook, constructed alike for cutting and thrusting, with a cross piece of steel, less sharp, for the purpose of pushing; one end of this cross-piece was turned down as a hook, for use in tearing down works against which an attack is made. The honour of inventing the halberd is contested by the Swedes and Danes, but probably each produced something resembling it. Its name appears to be derived from the Teutonic hilt, battle, and bard, axe. The halberd appears first in England about the time of Henry VIII., and maintained its position for upwards of two centuries. Now, it is rarely seen except on certain ceremonial occasions.

HALBERSTADT, an ancient and quiet town of Prussian Saxony, in the government of Magdeburg, and 30 miles south-west of the city of that name, is situated amid fruitful plains on the Holzemme, a tributary of the Saal. It is well built; its streets are for the most part long, broad, and tolerably straight; and among its most notable buildings are the Church of Our Lady (1065—1284), in the Byzantine style, and the cathedral, an elegantly proportioned Gothic edifice, begun in the middle of the 13th c., and dedicated to St Stephen. H. has two good libraries, and numerous collections of paintings, coins, and antiquities, which, together with the Poetical Society (Dichterverein), formed by the poet Gleim, have had the effect of maintaining here a lively appreciation for the arts and sciences. The manufactures are woollen and cotton fabrics, leather, soap, gloves, tobacco, and cigars; brewing and oil-refining are also carried on extensively. Pop. 21,031.

HALCYON DAYS, a name given by the ancients to the seven days which precede and the seven which follow the shortest day, on account of a table, that during this time, while the halcyon bird or king-fisher was breeding, there always prevailed calms at sea. From this the phrase 'halcyon days' has come to signify times of peace and tranquillity.

HALCYONIDAE. See KINGFISHER.

HALE, Sir Matthew, a distinguished lawyer, born in 1609 at Alderley, Gloucestershire. In his 24th year, he lost his parents, and was brought up by a kinsman of strict Puritan principles, and intended for the church. He was sent to Oxford University at 16, and was of studious disposition till a company of strolling players visited that seat of learning, when the long pent-up passions of youth were suddenly let loose, and in this vagrant company...
ne gave way to a good deal of dissipation, and at last was about to enter the army. But just at that time he became involved in a litigation about his patrimonial estate, and paid a visit to London to secure counsel. A shrewd lawyer, on that subject. The sergeant turned young H.'s ambition into a new direction; and ultimately, in 1629, the latter entered the Society of Lincoln's Inn, and was in due course called to the bar. He had by that time received considerable education, and became a great student, and soon acquired considerable practice. When the Long Parliament began to meet, he was of considerable reputation; and having cautiously refrained from committing himself to either of the great parties, both sought to enlist him in their service. But he declared for neutrality—conducted which Lord Campbell pronounces cowardly and selfish. When, however, the parliament triumphed, H. signed, as a thoughtless man, a petition presented to the Assembly of Divines at Westminster, tried to bring about a settlement between the king and parliament, and ultimately took his engagement to the Commonwealth, and was made a judge under Cromwell in 1653, having overcome his natural scruples about serving a usurper, on the plea of necessity. He acted as a puisne judge of the Common Pleas till Cromwell's death, but refused to have his commission renewed by Richard Cromwell, and was deprived of his seat. After the Restoration, he was made Chief Baron of the Court of Chancery; and after eleven years, was transferred to the Chief-justiceship of the Court of Queen's Bench. He was reckoned the best judge of his time, being acute, learned, and sensible, and set his face against bribery, one of the vices of the age. John Bunyan was brought before him, and convicted of frequenting conventicles; and when Bunyan's wife afterwards moved for his husband's discharge, she was politely dismissed without redress. H. also sentenced some women, convicted of witchcraft, to be executed, avowing his full faith in the delusion of that age, that this was a grave and dangerous offence. During his career as a judge, H. led an austere and scholarly life, leaving to the side of the Puritans. He made a friend of Richard Baxter, and has left a great reputation for piety. He wrote some legal works, which are still of the highest authority, and he bequeathed several valuable legal MSS. to Lincoln's Inn, which are still treasured there. He resigned his office from ill health in 1678, and died ten months after, on Christmas-day of that year.

HALES, STEPHEN, an English natural philosopher, was born at Beckesbourn, in Kent, in 1677, and died at Teddington, in Middlesex, in 1761. He entered Benet's (now known as Corpus Christi) College, Cambridge, in 1696, was elected Fellow in 1702, and having taken holy orders, was presented about 1710 to the perpetual curacy of Teddington, where the remainder of his life seems to have been spent.

His first important publication was Vegetable Statics, or an Account of some Statical Experiments on the sop of Vegetables (1727), which rapidly acquired so high a reputation as to be translated into French, German, Dutch, and Italian; and which may be considered the starting-point of our true knowledge of vegetable physiology. A second part of this work, under the title Herbastatics, and treating of the circulation of the blood, appeared in 1733. Besides other independent works, he contributed numerous memoirs to the Philosophical Transactions on Respiration, on the Methods of keeping Water Fresh, on Electricity, on the Analysis of the Air, &c. His ventilating machines were introduced into the London prisons, and were found most efficacious in diminishing mortality among the prisoners. His system was also adopted in France with similar good results.

His improvements in the mode of collecting gases did much to facilitate the subsequent labours of Black, Priestley, and Lavoisier.

HALÉVY, JACQUES FRANÇOIS FROMENTAL, a French composer, was born at Paris, of Jewish parentage, May 27, 1779. He studied under Herton and Cherubini, and afterwards at Rome. The first work of H.'s that brought him any considerable reputation was La Juive, produced at the Grand Opéra in 1835. The most important of his subsequent pieces (of a serious character) were—La Reine de Chypre, Charles VI., Le Juif Errant, and La Magicienne. Those executed for the Opéra Comique are regarded as his most successful; the principal are—Les Mouques, and Cerises (probably his masterpiece), L'Eclair, and Le Val d'Andorre. He was a great favourite with his countrymen; but his style was so purely national, that, in spite of his great dramatic power, he did not enjoy a great celebrity out of France. H. died in March 1862.

HALF-BLOOD, i.e., persons related through one parent only. When two persons have the same father, but not the same mother, they are called brothers or brother and sister consanguinean; when the same father and one parent only, they are brothers, &c. uterine. In the succession to real or landed property in England, the half-blood relations by the father's side succeed after the full-blood relations; and next, but at a considerable interval, the half-blood relations by the mother's side. In Scotland, also, the half-blood consanguinean succeed to heritable estate in the same way, though not in identically the same order; but the half-blood uterine never succeed in any event. In England, as regards personal estate, the half-blood on both sides succeed indiscriminately, and share equally with the full-blood. But in Scotland, the half-blood only succeed to movables estate after all the full-blood and their descendants are exhausted, and then the half-blood by the father's side succeed in exclusion of the half-blood by the mother's side, who do not come in until the succession reaches a distant point, viz., where the nearest relations are uncles and aunts consanguinean, or their descendants, in which case only the half-blood uterine after the mother's death take half the property, and the paternal relatives the other half. See Paterson's Comp. of E. and S. Law.

HALF-PAY, an allowance given in the British army to commissioned officers not actively employed in the rank to which the half-pay has reference. It corresponds to the French demi-solde, or pay of non-activité. It has long been a disputed point whether half-pay is given to officers as a retaining fee, to keep them at hand for the time when their services may be again required, or an award on account of services already rendered; but whatever the terms of the original grant, there can be little doubt that, under the present regulations, half-pay, except when distinctly named 'retired half-pay,' is in the nature of a retaining fee. This allowance is on quite a different footing in the navy and army.

In the royal navy of Great Britain, officers are merely appointed to serve during a specific time or certain ship is in commission; when this expires, their employment ceases, and they revert to a state of non-activity. As there are always many more naval officers than appointments for them to fill, it is a good plan to give a fair and effective list. These are placed on half-pay until again called upon to serve; the amount of such half-pay being usually about 60 per cent of the full pay of each grade. Half-pay is thus in the
HALIBURTON—HALICLZ.

nary a recognised condition for all officers not immediately wanted afloat.
In the British army, the case is wholly different; there is no such list or table, but a substitute, in which, in theory, he is supposed to serve, until removed from it on attaining the rank of general. Consequently, no fund, like the naval half-pay list, is in any degree admitted; superannuated officers attain, by long service, retired full-pay, and half-pay is only granted temporarily, either to officers thrown out of employment by the reduction of the corps with which they are serving, or to those compelled to quit active duties by sickness. No officer can obtain a removal to the half-pay list from any other than these causes, unless he succeed in doing so by inducing some officer to exchange with him; but this exchange is only allowed when the probabilities of life of each officer are about equal. On going to half-pay, it is customary to receive from the officer returning to full-pay the difference of value between a full and half-pay commission. Notwithstanding, however, these precautions on the part of the military authorities, the charge for half-pay for the army, though every year reduced, is still enormous, the sum of upwards of £300,000 being required for 1802. Half-pay officers appear to live long, for a large proportion of the receipts are officers who were placed on the list on the great reductions after the peace of 1815. The first grant of army half-pay was made in 1698 by William III. On receiving a superior appointment on the staff, a regimental officer is placed on temporary half-pay.

HALIBURTON, Thomas Chandler, ex-colonial judge, author, and politician, was born at Windsor, in Nova Scotia, in 1796. His father, the Hon. Mr Justice Haliburton, of Nova Scotia, was descended from an ancient Scottish family. H. received his education at King's College in Nova Scotia, afterwards practised as a barrister, and became a member of the House of Assembly. He was raised to the bench of the Common Pleas of the colony in 1829, and in 1840 became judge of the Supreme Court. In 1850, he retired from the bench, and took up his residence in England, which he had always regarded as his mother-country. In 1855, he received the degree of D.C.L. from the University of Oxford, and in 1859 took his seat on the Cleveland benches of the House of Commons as M.P. for Lancaster, which he continues (1862) to represent. H. is best known as the author of Sam Slick, the name of a Yankee clockmaker and pedler, a sort of American Sam Weller, whose quaint drollery, unsophisticated wit, knowledge of human nature, and aptitude in the use of what he calls 'soft sawdler,' have given him a fair chance of immortality. In a subsequent series, the author brings Sam Slick to England as an attaché of the United States legation, and is thus enabled to offer many shrewd and humorous observations on the aspects of British society, especially in regard to the upper classes and their pampered servants. Sam Slick has been translated into almost universally read, and has also been translated into many continental languages. H. is also the author of the Letter-boy of the Street system, Wise Sayings, Trivia, Canadian Sayings, Nature and Human Nature, Bubbles of Canada, Rule and Mursale of the English in America, and A History of Nova Scotia.

HALIBUT, or HOLLIBUT (Hippoglossus vulgaris), one of the largest kinds of flat fish (Pleuronectidae), is a form more elongated than the flounder or the halibut, the eyes on the right side, the upper surface smooth, and covered with small soft oval scales, the colour brown, of different shades, the under surface perfectly smooth and white. The H., although esteemed for the table, is not to be regarded in quality with turbot; its flesh is white and firm, but dry, and has little flavour. It is common on the British coasts, but more abundant in the north than in the south; and great numbers are taken by the thickney fishermen. It is not found in the Baltic, but is plentiful on the coasts of Norway, Iceland, and Greenland, and large quantities are taken on the northern parts of the American Atlantic coast. It is a fish of great value to the Greenlanders, who preserve it for winter use by cutting it into long strips and drying it in the air. Oil is obtained from it in considerable abundance. It attains a great size; specimens have been caught weighing nearly five hundred pounds. Other species of the same genus occur in the seas of other parts of the world.

HALICARNASSUS (originally called Zephyria) was one of the Greek cities of Asia Minor, situated on the Ceramic Gulf. It was founded by a colony from Troezen, and was one of the cities of the so-called Doric Arc, which was removed from it, however, it was eventually excluded. H. was the largest and most powerful of the cities of Caria, and by its situation and the inaccessible position of its citadel, was regarded as a great stronghold against the people, owing to the ever-varying influence of the climate, were of a weak and effeminate character; and during the Persian conquests, readily yielded to the dominion of the conquerors. During this period (about 550 B.C.), a body of Persians, led by Lygdamis, rose to supreme power, as a vassal of Persia; and under his descendants the city, without forfeiting the Greek character, or ceasing to cultivate the Greek literature and arts, remained faithful to the Persian interest. Artemisia, the daughter and successor of Lygdamis, actually commanded a naval squadron in the fleet of Xerxes, at the battle of Salamis. Alexander the Great, provoked by the obstinacy with which the city held out against him, commanded that it should be destroyed by fire; but the inhabitants took refuge in the citadel, which successfully resisted his arms. The city was afterwards rebuilt, but it never recovered its ancient importance or prosperity. In the days of the Roman empire, it had sunk into comparative political insignificance, its only title to consideration at that time being the celebrated Mausoleum, erected in memory of one of the rulers, named Mausolus, by his sister (who had also been his wife and successor) Artemisia. H. was the birthplace of two of the most eminent of the Greek historians, Herodotus and Dionysius. The site of the city is occupied by the modern Bourem. For an account of the discovery of the ancient remains of the city, and of the disentombment of the Mausoleum, see MAUSOLEUM.

HALICORN. See DUGONG.

HALICZ, a town of Austria, in the crownland of Galicia, is situated on the Dniester, in a fruitful district in the administrative division of Stanislavow, about 14 miles north of the town of that name. There are here a convent of the Minorites, a community of Jews of the sect of the Caritie, distinguished for their industry and uprightness; and on the ridge of a hill in the vicinity, the ruins of the once strongly fortified castle of Halicz, which has frequently been the scene of bloody sieges. H. from which Galicia has derived its name, is the oldest town in that crownland. It was built in the 12th c. and its castle was the residence of the rulers of what was formerly the grand principality and kingdom of Halicz. For 2000.
HALIDON HILL—HALIFAX.

HALIDON HILL, situated about a mile to the north-west of the town of Berwick, in the fork formed by the Whitadder and the Tweed, was the scene of a bloody conflict between the English and Scots, 19thJuly 1333. Edward III., having determined to support the claims of Edward Baliol to the crown of Scotland, advanced to the borders with a large army, and laid siege to Berwick, the governor of which promised to surrender on the 20th of July, if not seriously beleaguered. On the 19th, the acting regent of Scotland, Archibald Douglas, Lord of Galloway, surnamed 'the Tyneman,' with a large force, came in sight of Berwick, and found the English drawn up on the north side of Halidon Hill. Regardless of fatigue, the Scots immediately advanced to the attack, but while crossing the morass which skirts the base of the hill, suffered severely from the English archers. They nevertheless struggled onwards, and mounted the hill, but were repulsed and compelled to retreat by a well-aimed volley of musketry.

HALIFAX, a thriving market-town, municipal and parliamentary borough of England, in the West Riding of Yorkshire, is situated principally on the north bank of the river Calder, which rises in the Calder, on the slope of an eminence rising above the river, and is almost wholly surrounded by hills. It is 43 miles south-west of York, and 217 miles north-north-west of London. Its situation is pleasing, and its general appearance handsome, while its ample supply of water-power and of coal, its facilities for transport both by water and by leading lines of railway, and its position in position all combine to make it one of the most thriving manufacturing towns in the north of England. The manufacture of goods, besides carpets, which are chiefly made at Westmorland, contribute materially to its manufacturing and commercial importance. Among its most notable buildings are the parish and Trinity churches, the magnificent Gothic church by Scott, erected at a cost of £40,000, in memory of Edward Akroyd; the Piece Hall, a large quadrangular stone building, erected in 1779, at a cost of £12,000, and comprising 315 apartments or warehouses for the reception and sale of manufactured goods; and the assembly rooms, Mechanics' Institute, and theatre. Among the numerous public and private educational institutions of Halifax are the Heath Grammar School—founded in 1583, with an endowment of £270 a year—and the Blue Coat School. In 1857, Mr. F. Crossley, M.P. for the West Ridin in, presented a magnificent silver cup to the town. A town-hall is now (August 1862) nearly completed, at a cost of about £40,000, from designs by the late Sir C. Barry, R.A. H. has also literary and scientific institutions, with libraries and reading-rooms. The woollen and worsted manufactures of Halifax are done in great perfection, and the west end of the town is occupied in the construction of mill-machinery, and in raising coal, slate, and freestone. Pop. (1861) 37,015.

A strange old local law, known as the Halifax Gibbet Law, was enacted here at an early period of the town's existence, for the purpose of deterring the manufacturers against the thievesy propensities of their hands, who were in the habit of robbing their employers, by keeping to themselves a portion of the material which ought to have gone into the cloth, so that when manufactured, the fabric was discovered to be of inferior weight and body. The Gibbet Law provided that all persons within a certain circuit, who had stolen property of or above the value of 13s., were to be tried by the freemen within the liberty, and if found guilty, were hanged over to the magistrates for punishment, and were executed on the first market-day following by means of an instrument similar to the gibbet used in Scotland. A stage or platform was erected in the market-place, and the executions took place is still to be seen, and the axe is preserved in the old jail in Jail Lane.

HALIFAX, CHARLES MONTAGUE, EARL OF, poet and statesman, grandson of Henry, first Earl of Manchester, and nephew of the famous Parliamentary general, was born at Horton, in Northamptonshire. He was educated at Westminster School and Trinity College, Cambridge. A laudatory poem on Charles H. first brought Montague into public notice. Two years later, appeared
the parody on Dryden's *Hind and Panther*, entitled *The Town and Country Mouse*, of which he was joint author with Matthew Prior; but his poetry would hardly have made his name remembered in the 19th century. He almost disappeared from the field of literature after the appearance of his satire, save as the patron of Addison and other men of letters. He had intended to enter the church, as it afforded a regular income, but tempted by the offer of a seat in the House of Commons, he became member for Malden in the Convention Parliament, where he harangued for the declaration that James II. had abdicated, and that the throne was thereby vacant. He retained his seat in William III.'s first parliament, and was appointed in 1692 a Commissioner of the Treasury. On the 15th December of this year he proposed, in the House of Commons, to raise a million sterling by way of loan. William required money for his wars—the moneystacked classes were tired of bubble companies, and knew not where to invest safely, and the landowners were weary of heavy taxation; so the National Debt was established. In the spring of 1694, money was again wanted, and Montague was ready to supply it. This time, he did so by originating a national bank, a scheme for which had been laid before government by William Paterson three years before. The capital was to be £1,500,000, and the shareholders were to be called the Governor and Company of the Bank of England. The bill for this was ultimately passed; the first result was immensely fortunate, and Montague became chancellor of the exchequer. His next work was the reconnoitring of 1695, which he carried out successfully, appointing Newton warden of the Mint, and raising a tax on windows to pay the expenses thereby incurred, and also he voted money to redeem hearth-money. The interval between the last day on which the old money was receivable in payment of taxes, and the issue of the new coin, was, owing to the absence of a circulating medium, likely to cause much distress; but he obviated this by establishing exchequer bills bearing interest daily, and ranging in amount from £2 to £2500. On Godolphin's resignation in 1697, he became premier, but soon becoming unpopular, was obliged to bestow upon himself the authorship of the exchange, and resign his higher offices. Harley insisted on his withdrawal from the Commons, and he became Baron Halifax, adopting a title which had just become extinct, in the persons of the last House of Lords for breach of trust in 1701, and again in 1703, but the proceedings fell to the ground. During the whole of Aune's reign, H. remained out of office, but was active in promoting the union with Scotland and the Hanoverian succession. On the queen's death, he was naturally appointed a member of the council of regency, and on George I.'s arrival, became an earl and prime minister. His rule lasted only nine months, being terminated by death on the 19th May 1715. H. had, though an arrogant and mean man, and fond of display, was a consistent politician, and one of the greatest financiers of his time.

**HALIOTIS-HALL**

**HALIOTIS**, a genus of gastropod mollusces, the type of a family, *Halitidae*, of the order *Scutellariolina*, and having a widely open ear-shaped shell, with a very low spire, and a row of holes not far from the opposite margin over the surface of the mantle, through which the water gains access to the gill-cavity. The holes are closed as the animal grows, and new ones formed, which first appear as notches along the margin of the shell. The animal, in a living state, exhibits great beauty of colours. It adheres to rocks by a large muscular foot, after the manner of limpets. One species, *H. tuberculata*, is not uncommon on the southern European coasts, and is found on those of the Channel Islands. It is used for food; the shell is also sought after for an ornament, and for the sake of the Nacre (q. v.) in which it abounds, and which is much used for mother-of-pearl ornaments, and particularly for ornamenting papier-maché articles. The shells of this genus are called Earshells or Sea Ears. They are the Ormers of the French. The species are very numerous; the most splendid are natives of warm climates.

**HALL, BASH-, CAPTAIN, R.N.,** a distinguished traveller, a young man, Sir James Hall of Dunglass, was born in Edinburgh in 1778, and died at Portsmouth in 1844. He entered the navy in 1802, and became post-captain in 1817. When Lord Amherst was sent on a mission to the court of Pekin in 1816, H. commanded the *Lyra*, a small gun-brig, which accompanied the expedition, and took the opportunity of visiting some of the places along the coast of Corea, which were little known to Europeans. The chief results of this exploration were published in a book, entitled *A Voyage of Discovery to the Western Coast of Corea and the Great Loo-Choo Island in the Japan Sea* (Lond. 1818), which excited much interest, and passed through at least three editions. Amongst his other works, we may mention *Extracts from a Journal written on the Coast of Chili, Peru, and Mexico*, in 1820—1822 (which forms two of the earlier volumes of *Constable's Miscellanies*), *Travels in North America*, in three volumes (a work that was violently attacked by the American press); *Fragments of Voyages and Travels*, in three series, each consisting of three volumes (a work of great interest, and still very popular); and *Patchwork*, in three volumes, published in 1841. He was a Fellow of the Royal Societies of London and Edinburgh, and a member of the Astronomical Society of London. He was the author of various articles in the scientific journals of the day, and in the *Encyclopædia Britannica*. During the last two or three years of his life he suffered from mental alienation, induced probably by excessive literary work, and was placed in the Royal Hospital, Haslar, where he remained till his death.

**HALL, JOS.,** an English bishop, remarkable for his learning, piety, and misfortunes, was born in 1574 at Ashby-de-la-Zouch, Leicestershire. He was educated at Emmanuel College, Cambridge, of which he became a Fellow. Entering the church, he became, in 1617, Dean of Worcester, and one of the English deputies to the synod of Dort, 199.
HALL, REV. ROBERT, a celebrated English dissenting preacher and writer, was born at Arbury, near Leicester, May 2, 1764. He was the son of a Baptist minister of some note as a preacher and author of religious works, and was the youngest of fourteen children. He was feeble in body and precocious in intellect, learning to read almost as soon as he could speak, from the tomestones of the churchyard, his playground. At the age of 15, he was sent to a Baptist academy at Bristol, where he gave promise of his future fame as an orator of his from his first lesson. His nervous organization was so delicate that he lay down in his first public efforts. In 1781, he entered King’s College, Aberdeen, where he remained four years. An intimate companionship with Mackintosh, in which they read and discussed philosophical physiology, was of great service to him. Graduating in 1785, he became, at the age of 21, assistant Baptist minister and tutor in the academy at Bristol. He was a fluent, rapid, and impressive speaker, and was liberal, but not heterodox in his religious views. In consequence of a disagreement with his colleague, he went in 1790 to Cambridge, where, by his elaborate composition and vivid eloquence, he rose to the highest rank of British orators. He is not less distinguished as a writer, whose writings and published discourses, than as a pulpit orator. His Apology for the Freedom of the Press, 1793, and sermon on Modern Infidelity, extended his reputation. In 1806, he settled in Leicester; married in 1808. After a brilliant period of teaching and preaching, he returned to Bristol in 1825, and died February 21, 1831. He was an indefatigable student, learning Italian at 60, that he might enjoy Dante, and full of wit, fun, and a spontaneous eloquence, so that the study of his manuscript communications was supposed to do more for his writings. Nearly all his life he suffered the tortures of an obscure disease of the spine; he had at times attacks of insanity, and his death was preceded by great agony, caused by a large calculus in one of his kidneys; yet few men have performed more intellectual labour. A complete edition of his works, with a memoir by Dr O. Gregory, and Observations on his Character as a Preacher by John Forster, was published at London, in 6 vols., 1831—1833; 11th edition, 1853.

HALL, MRS ANNA MARIA, an eminent novelist, the daughter of a gentleman named Fielding, who died when she was very young, was born in Dublin in 1782. In her 15th year she left Ireland with her mother, and went to reside in London, where her education was completed. In 1802, she married Mr. S. C. Hall, a gentleman well known for his works connected with the fine arts, and was thus led to become an authoress. Her first work, Sketches of Irish Character, published in 1828, at once established her being long known to physicians, but he believed himself to have been the first to shew their independence of sensation, to bring them together under one generalisation, to establish with precision the laws of their production, to assign them their just rank in physiology, and to apply the doctrine to the elucidation of disease. His more strictly professional writings are many and valuable; they appeared partly as independent publications, and partly in the medical journals. His last bequest to the science of medicine and the cause of humanity, was the description of a simple and easily applied method of restoring suspended respiration, which has already been the means of saving many from untimely death, and is known as THE MARSHALL HALL METHOD. It is briefly described in the article ASPHYXIA. His memoirs, with a large collection of his letters, have been published by his widow.
time of the Commonwealth, in which Cromwell's character is vindicated. Her other works rapidly followed—*Tales of Woman's Trials*, in 1834; *The Outlaw*, a novel of the reign of James II., in 1835; *The French Refugee*, a drama, which in 1836 was acted for about fifty nights at the St James's Theatre, London; *Uncle Horace*, 3 vols. 1837; *Lights and Shadows of Irish Character*, 1838; *Marian, or a Young Maid's Trials*, 1839; *The Whiteley*, 1845, &c. Her *Stories of the Irish Peasantry* appeared originally in *Chambers's Edinburgh Journal*, and were afterwards published in a collected form. She is also the author of a graceful fairy tale of love, *Midsummer Eve*, originally contributed to the *Art Journal*, and of a pleasant illustrated series of descriptive sketches, inserted in the same publication, and subsequently published separately under the title of *Pilgrimages to English Shrines*. The last two, with some others of her writings, have been translated into German. Besides assisting her husband in his illustrated work on *Ireland*, she has furnished numerous contributions to the periodicals of the day, and written various books for the young. Of these, *Uncle Sam's Money-box* is one of the best.

**HALL**, the large principal apartment of the castles and dwelling-houses of the middle ages. The hall is of very ancient origin. The earliest Saxon buildings we have any record of are the palaces of the kings, and these seem to have consisted of one large hall, in which the king, his courtiers or 'hearth-men,' and all his retainers dwelt together, eating at the same table, and sitting round the same fire; and one other chamber, in which the king and his hearth-men slept, while his retainers slept in the hall. The Normans built their houses on the same plan—with the hall and one Solar (q. v.) or sleeping apartment. The same arrangement prevailed, with slight modifications, during the 12th and 13th centuries. In the 14th and 15th centuries, when the country was more settled and prosperous, and manners more refined, more numerous apartments became necessary. The hall, however, still retained its place as the chief apartment. In it the king or the lord of the manor gave audience, administered justice, received and entertained his retainers and guests, and performed all the public acts of feudal life.

At one end of the hall was a raised platform or dais, on which the table of the lord of the manor was placed, and where his more honoured guests sat along with him. The retainers sat at a table which ran along the lower part of the hall. This part was not always in the cleanest and sweetest condition, and hence it received the name of 'the marsh.'

![The Great Hall of Eltham Palace.](image)

The hall partook of the style of architecture prevailing at the time when it was built, and being a large and important apartment, was generally ornamental in its character. The roofs especially were very carefully and elegantly constructed, as many still remaining shew. The hall of the king's palace, now called 'Westminster Hall,' built by William Rufus, and restored by Richard II., is the finest example in England, being 300 feet long and 100 feet broad. The great hall at Eltham, as shown in the above cut, is another fine example.

The hall was essentially a part of feudal architecture. When that system gave way, the large common halls were abandoned. Many old ones, however, still remain, but their use is changed.
HALL, HALLE, AND HALLEIN, are the names of various places in Southern and Middle Germany. The word Hall is also a general name for a salt manufacture. The Welsh and Armorican word for salt is hal, halen; hence it is inferred that these names were bestowed by Celtic tribes of the Cymric division (to which the ancient Gauls belonged). The Gaelic for salt is saul-anu, agreeing thus with the Lat. salis, and the Ger. salz. The Greek halas (sals) agrees with the Cymric. The names Salza, Salzburg, are clearly of Teutonic origin.

Halle, a small and very old town of Austria, in the Tyrol, is situated on the left bank of the Inn, which is here navigable, six miles east of Innsbruck. Its parish church, built in 1271, with a monument that marks the grave of Speckbacher, the bravest and most skilful leader of the Tyrolese in their struggle for independence; its gymnasium, its Franciscan convent, and its Minstelhurn, are the chief buildings. About nine miles north of the town is the Salzburg, with salt-mines, from which salt in the form of brine is conveyed to the pans of H. in wooden pipes. Although the demand is not so great as formerly, upwards of 300,000 cwts. of salt are still produced here. H. has also manufactures of sal-ammoniac and chemicals. Pop. 4969.

HALL, or SWÄDISCH HALL, an old and picturesque town in the kingdom of Württemberg, is very beautifully situated in the deep valley of the Kocher, 35 miles north-east of Stuttgart. It is surrounded by a ditch and by high walls surmounted with towers. Like other places in whose names the word Hall or Halliz occurs, it has considerable salt-works, which, together with those of Wilhelmshäuck, produce annually nearly 80,000 cwts. There are also tan-works, soap-works, and manufactures of cotton goods and bijouterie. Pop. 6766.

Halle, a very early period was the seat of a mint, and the coins first struck were called Heller (Haller). The town belonged first to the Counts of Westheim, then later to the Knights Templar. In the 13th c. it became a free imperial town, and such it remained till 1812, when, with its territory of 126 square miles (pop. 16,000), it was added to the kingdom of Württemberg.

HALLA, or HALLA, a town of Hindustan, in the country of Scinde, is situated on the left bank of the Indus, 33 miles north of Hyderabad. Manufactures of caps, superior coloured earthenware, and lacquered work, are extensively carried on here. Pop. 11,000, the most of whom are manufacturers. H. is said to be the most ancient city of Scinde.

HALLAM, HENRY, philosophic historian and critic, son of the Dean of Bristol, was born at Windsor in 1777, and educated at Eton and Christ-Church, Oxford, where he took his degree of M.A. He was first known by his writings in periodicals, especially by contributing to the Edinburgh Review during its early years; afterwards, he was distinguished among the literary men of Europe for his extensive and profound learning, powers of generalisation, taste, judgment, and conscientiousness, exhibited in a succession of great works: View of the State of Europe during the Middle Ages (2 vols. 4to, 1818); The Constitutional History of England from the Accession of Henry VII to the Death of George II. (2 vols. 4to, 1827); and Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries (4 vols. 8vo, 1837—1839), and a volume of supplementary notes to his History of the Middle Ages (1835). All these works, with several others, and been translated into the languages of the leading European nations. They have procured for their author the enviable reputation of having opened up a new and great field of authorship, and bloomed in it with a success that as yet has not been equalled by another. Their wonderful impartiality and veracity are a rebuke to ordinary historians; and it provokes a smile to read, at this distance of time, the strictures of Southey on the accuracy, the arrogance and the injustice, and the ill-temper of their author; for England never produced a man who loved truth more disinterestedly than Hallam. H., while yet a young man, was held in the highest estimation among the literary men of his time, both in London and Edinburgh. During the greater portion of his long life, however, he lived in London in privacy, devoting himself to linguistic and historical studies. In politics, he was a Whig; but for the conflicts of parties he was unbiassed by his censure and general temperament, and took no part in them, but he displayed a genuine interest in all questions of social improvement, and acted with the Wilberforce party for the abolition of slavery, as well as in other humane schemes, and was one of the original promoters of the Society for the Diffusion of Useful Knowledge. H. had two sons, both of great promise, and both prematurely cut off; the elder, Arthur Henry, who died 1833, was a friend of Alcott and Taylor; the younger, laureate, and is the subject of In Memoriam. Of this son, H. has written a touching memoir. H. died January 1859. He was a Fellow of the Royal Society, the Royal Literary Society, and a trustee of the British Museum.

HALLAMSHIRE, a district in the West Riding of Yorkshire (q. v.).

HALLE, or HALLEIN, a town of Austria, in the duchy of Salzburg, and 10 miles south of the town of that name, is situated on the right bank of the river Salza, and is noted for its extensive salt-works and saline baths. Pop. 4060. It has also important cotton and needle and button factories. The Dürenberg, a mountain 2388 feet above the level of the sea, from which the brine is obtained, has 34 shafts or rooms, from which the salt is conveyed in large wooden troughs through the works within the town. The annual produce amounts to about 400,000 cwts. Good rock-salt is also obtained from Dürenberg.

HALLE, a city of Prussian Saxony, in the district of Meissen, 33 miles E. of Dresden; as H. on der Saale, to distinguish it from other places of the same name, is situated on the right bank of the Saale, and on several small islands of the river, 10 miles north of the city of Meissen, and consists of H. proper, with its five suburbs, and the governmental establishments of Glauchau and Neumarkt. It is chiefly celebrated for its university, which was founded in 1694 by Frederick I., king of Prussia; and after having been suppressed by Napoleon when it had attained the summit of its fame, was re-established in 1815, and incorporated with the university of Wittenberg, which had been dissolved during the war. From its earliest foundation, this institution has been regarded as the chief seat of the pictorial school of theology, and of particular advantage to students of every faculty; and, in addition to its theological seminary, it has an academy of the physical sciences, an observatory, and a medical school supplied with surgical wards, an anatomical theatre, and botanical garden; and a library containing 60,000 volumes, and various scientific collections. The endowments for the professors and other teachers are liberal, but the attendance of students is limited, and it now amounts to about 700 students. The Francke Institution is one of the most important establishments.
of the place. See FRANCKE. The red tower on the market-place, the town-hall, and the remains of the Moritzburg, the ancient residence of the archbishops of Magdeburg, are all interesting to the antiquary. H. is amply provided with benevolent and educational establishments for the poor, and has a well-conducted institution for the blind, deaf and dumb, and insane, with free schools for boys and girls and female institutions. H. has on the seat of various government offices and courts of jurisdiction. H. has manufactories of woollen and linen fabrics, gloves, buttons, hardware, and starch; but its most important industrial product is salt, obtained from the brine-springs within and near the town, which have been worked from a very early period, and still yield between 200,000 and 300,000 cwts. annually. Those within the town are worked by a private company, while the suburban works are held by government. The men employed at the salt-springs, and known as the "Hallesches," are a distinct race, supposed by some to be of Wendish, and by others of Celtic descent, who retain the peculiar habits of their forefathers.

Pop. (1859) 38,280.

The origin of H. dates back to the earliest periods of the Germanic empire, when it formed an appanage of the Archbishops of Magdeburg, against whom the citizens frequently waged successful war in the middle ages, during which period the city was at the height of its prosperity. As the point of union between various important lines of railway, and in consequence of the improved means of water-communication between the Saale and Elbe, H. has of late years been making rapid advance in commerce and home industry.

HALLECK, HENRY WAGNER, an American general, born in Oneida co., N.Y., the 16th of January, 1814. Having entered the military academy at West Point in 1835, he graduated in 1839; he afterwards served as assistant professor of engineering in that institution. He was brevetted captain for gallant conduct in the Mexican war, Nov. 1847, and was subsequently secretary of state of California during its military government, from 1847 to 1849. He was a member of the convention to form, and of the committee to draft, the state constitution of California. For several years he practised law in that state with great success. Besides a work entitled Elements of Military Art and Science (1816), he has published Mining Laws of Spain and Mexico, and a work on the territory of Texas (1841).

In Aug. 1861, he was appointed a major-general, and subsequently commanding general of the department of the West; under his direction Fort Donelson was captured and other important successes were obtained by the armies of the West. July 11, 1862, he was promoted to the rank of general-in-chief of all the armies of the United States.

HALLELUJAH (Heb. Prase ye the Lord), one of the forms of doxology used in the ancient church, derived from the Old Testament, and retained, even in the Greek and Latin liturgies, in the original Hebrew. The singing of the doxology in this form during the Masses of the Middle Ages and in the prayers of the Roman Catholic Church has caused a diversity to prevail in different churches and at different periods as to the time of using it. In general it may be said that, being in its own nature a canticle of gladness and triumph, it was not used in the penitential seasons, nor in services set apart for occasions of sorrow or humiliation. In the time of St Augustine, the African Church used the Hallelujah only from the feast of Easter to that of the Assumption of the Virgin; and in the rest of the services throughout the year, with the exception of the seasons of Lent and Advent and the vigils of the principal festivals. In the Roman Catholic Church, the Hallelujah is introduced both into the missa and into the several hours of the public office, but it is discontinued from Septuagesima Sunday until Easter; and, in the contrary, during the interval between Easter and Pentecost, it is introduced more frequently into the hours. In the service of the commemoration of the Passion of Our Lord, it is always omitted in the services for the dead, and on the ember days, at the quarter tense, and on the principal vigils. In the Church of England, the first Prayer-book of Edward VI. retained the Hallelujah in the original Hebrew. In the present Prayer-book, although retained, it is found not in the Hebrew, but in its English equivalent, Praise ye the Lord. See Binterm's Denksaeuligkeiten der Christ-Kirche.

HALLEK, ALBRECHT VON, an eminent physiologist, was born at Bern, October 1708, and died in that city, December 1777. In early life, he was feeble and delicate, being affected with rickets, a disease which is not uncommon. The professor of anatomy, with considerable intellectual precocity. His father, Nicholas Emmanuel von Haller, who was an advocate, and had the reputation of being an able lawyer, intended him for the church; but his own inclinations in favor of natural philosophy caused him to succeed in 1723 (two years after his father's death) to the university of Tübingen, where he became the pupil of the well-known anatomist Duvemery. In 1725, he removed to Leyden, where he attended with much advantage the lectures of the celebrated Helveticus, and obtained the degree of Doctor of Medicine in 1727. He then visited London, where he made the acquaintance of Sloane, Douglas, and Chevallen; whence he proceeded to Oxford, and afterwards to Paris, where for six months he studied anatomy and botany under Winslow and De Jussieu, but one of his neighbours, who was annoyed by his dissections, having threatened to denounce him to the police, he made a rapid retreat to Rued, where he became the pupil of John Bernoulli, the celebrated mathematician. After seven years' study in these different seats of learning, he returned, in his 25th year, to his native city, and commenced practice as a physician. The professor of anatomy, Meig, having fallen ill, H. undertook the duties of his class; he likewise devoted much of his time about this period to the botany of the Alps; and also published a celebrated descriptive poem, entitled Die Berg-Blumen (1731). He was appointed physician to the hospital, and shortly afterwards, principal librarian and curator of the university of Göttingen, offered him the professorship of medicine, anatomy, botany, and surgery, which, after some hesitation, he accepted. From this time, he gave up the practice of his profession, and for the next 18 years devoted himself wholly to teaching and to original research. He took an active part in the formation of the Royal Academy of Sciences of Göttingen; and the memoirs of the society, which appeared under the title of Commentarii Societatis Regiae Gottingensis, contain many of his papers. During the period that he held the professorship—viz., from 1736 to 1753—he composed and published 86 works on medical subjects, chiefly on physiology and botany; it is recorded that he contributed upwards of 12,000 notices or reviews of books to the Göttingische gelehrte Anzeigen, a monthly periodical work, of which he was editor. In 1753, in consequence of disputes with the university about the form in which the delicate state of his health, he resigned
HALLEY—HALLUCINATIONS.

his chair, and returned to his native town, where he subsequently held several important and honourable offices. He still, however, retained his position as president of the Royal Academy of Sciences, and other more substantial distinctions, such as a retiring allowance, &c. It was after his retirement from Göttingen that some of his most important writings were published, amongst which must be especially mentioned his Elementa Physiologica Corporis Humani (Lusanne, 8 vols. 4to, 1757—1766)—by far the most important of his works—and his four Bibliothecae, or critical catalogues of works on botany, surgery, anatomy, and medicine. The increasing maladies of his later days did not distract his mind from the study of his favourite subjects. He recorded all the symptoms of his last illness—a combination of gout and disease of the bladder—and the official causes of his vital Turner, and his last words, addressed to his physician, were: 'My friend, the pulse has ceased to beat.'

H.'s eminence as a man of science was duly recognised even in his own lifetime. In 1718, he was appointed physician to the king of Great Britain; he was ennobled by the emperor of Germany in 1748; the universities of Berlin, Oxford, and Utrecht in vain endeavoured to obtain him as their professor; and the most important journals of all the scientific societies of Europe. His name is especially connected with the doctrine of muscular irritability, which is noticed in the article Muscular and Muscular Tissue; and if he made but few positive additions to our knowledge, his teachings and writings impressed a new aspect on physiology—a science of which he has deservedly been termed 'The Father.' But, while his name is indelibly recorded in the annals of science, his reputation in his own country as a poet probably exceeds his name as an anatomist and physiologist. Die Elegische Gedichte (Elegiac Poems), &c. being still frequently republished in Germany.

HALLEY, EDMUND, a celebrated astronomer and mathematician, born at Haggerston, near London, in 1656, educated at St. Paul's School, and afterwards at Queen's College, Oxford, which he entered in 1673. He early became an experimenter in physics—before leaving school, he had made a series of observations on the variation of the needle. In 1676, he published a paper (Philosophical Transactions) on the orbits of the principal planets; also observations on a spot on the sun, from which he inferred its rotation round its axis. In the number of the same year he went to St. Helena, where for two years he applied himself to the formation of a catalogue of the stars in the southern hemisphere, which he published in 1679 (Catalgoe Stellarum Australium). On his return, he was chosen a Fellow of the Royal Society, and deputed by that body to go to Danzig to settle a controversy between Hooke and Helvetius respecting the proper glasses for astronomical observations. In 1680, he made the tour of Europe, during which he made observations with Cassi-\(i^{1}\) at Paris on the great comet which goes by his name, and the return of which he predicted. His observations on this comet formed part of the foundation of Newton's calculus of fluxions, which Newton had announced to England in 1681, and in 1683 published (Phil. Trans.) his theory of the Variation of the Magnet. The next year, he made the acquaintance of Newton—the occasion being his desire for a test of a conjecture which he had made that the centripetal force in the solar system was one varying inversely as the square of the distance. He found that Newton had anticipated him, both in conjecturing and in demonstrating this fact. For an account of H.'s connection with the publication of Leibniz's Principia, see NEWTON. In 1686, H. published an account of the trade-winds and monsoons on seas near and between the tropics, which he followed by some other chemical-meteorological papers. In 1692, he published his hypothesis relative to the change in the Volumes of the Needle, to test the truth of which, by obtaining measures of the variations in different parts of the world, he was sent in 1698 in command of a ship to the western parts of the crew mutinied, and he was obliged to return. The next year, however, he sailed again on the same expedition, and the result of his observations was given to the world in a general chart, for which he was rewarded by the rank of captain in the navy with half-pay for life. Soon after, he made a chart of the tides in the Channel, and surveyed the coast of Dalmatia for the emperor of Austria. On the death of Dr. Wallis in 1705, he was appointed Savilian professor of geometry at Oxford. In 1705 he published his researches on the orbits of the comets. In 1713, on the death of Sir Hans Sloane, he became secretary of the Royal Society; in 1716 he made valuable experiments with the diving-bell, which were afterwards published; and in 1720, after the death of Flamsteed, he became astronomer-royal, and continued without assistance to conduct the operations of the Royal Observatory for the benefit of science and the country. In this office, and engaged especially in studying the moon's motions, he passed the rest of his life. In 1729 he was chosen a foreign member of the Academy of Sciences, Paris. He died at Greenwich, 14th January 1742, 86 years old. He had married, in 1686, a daughter of Mr. Tooké, auditor of Exchequer, by whom he had several children. Besides the writings mentioned, H. wrote many others. His Tabula Astronomicata did not appear till 1748. Among his other researches, it may be mentioned that of the long inequality of Jupiter and Saturn, and that of the low acceleration of the moon's mean motion. He has the honour of having been the first who predicted the return of a comet, and also of having recommended the observation of the transit of Venus with a view to determining the sun's parallax—a method of ascertaining the parallax first suggested by James Gregory.

HALLEY'S COMET. See Comet.

HALLOWELL, a city in Maine, United States, America, on both sides of the river Kennebec, two miles above its mouth from Augusta. It contains an academy, ten schools, two tanneries, factories of cotton, oil-cloth, &c., and a large coasting-trade in lumber and granite. Steam-boats and vessels of nine feet draught can load. Pop. 4700.

HALLOW-EVEN, or HALLOWEEN, the name popularly given to the eve or vigil of All Hallows, or festival of All Saints, which being the 1st of November, Halloween is the evening of the 31st of October. In England, it was long customary to crack nuts, duck for apples in a tub of water, and perform other harmless fire-side revolries. While the same thing can be said of Scotland, the Halloween ceremonies of that country partook more of a superstitious character; taking, among rustics, the form of a charm to discover who should be his or her partner for life. Of these now almost exploded customs, the best summary is that contained in Burns's well-known poem Halloween. We refer to Brand's Popular Antiquities for some notice of old English superstitions.

HALLUCINATIONS are morbid conditions of mind in which perception takes place where no impression has been made upon the external organs of the special senses, and where the object is believed to be real and existing. A picture is presented to the imagination when no ray of light has fallen
HALMALILLE—HALOID SALTS.

upon the eye; a voice is heard when all around is silent; a pleasant smell fills the nostril when neither flowers nor leaf give forth their fragrance. Delusions, on the other hand, originate at the other extremity of the chain of consciousness in the mind itself. No other signs, nor other ways, of hallucinations are real sensations. A form passes across the vision, and it is regarded as a phantom, or a demon, or what is not and cannot be; a voice may address the listener in accents of tenderness and friendship, or, upon a most careful analysis, it is found through which he could have assumed the shape of insults and calumnies; and the fresh odor of a rose may suggest notions of poison and pollution. But hallucinations may involve internal experiences as well as the reports from the outer world; nor is it invariably possible to narrowly distinguish hallucinations from delusions. There is a composite state in which the external impression is imaginary, and the interpretation from such an impression, had it been real, is erroneous. A clock is heard by a patient to strike where not a sound is audible by others, and the chime is held to be the announcement of the crack of doom. In all these cases, the organ itself must be held to be the observer affected by the, the of seeing, hearing, &c., be structurally affected or not. These phenomena are observed in connection with all the senses, but in different proportions; the frequency being perhaps in relation to the number of healthy sensations of which the organ is the natural channel, and to the degree of excitement and cultivation to which it is ordinarily subjected. According to one authority, hallucinations of hearing constitute two-thirds of the whole observed; but, upon a most careful analysis, the following tabular expression of frequency appears to be correct: hallucinations of hearing, 49; of vision, 48; of taste, 8; of touch, 3; of smell, 1. These conditions are detectable in all mental diseases; but the proportions vary according to the forms and intensity of the alienation. All are more frequent in mania than in monomania and fatuity; and errors of vision are more numerous than those of hearing in mania. Lord Brougham at one time held that the presence of hallucinations should be elected into a cruel test of the existence of insanity. Practical men, however, demonstrate that derangement is not necessarily conjoined with such a symptom. Every rule has its exceptions, and the evidences of a state would be affected with hallucinations. Of 145 individuals in Bicêtre, Baudry found that 56 presented hallucinations; and the subsequent researches of Thorne and Aubanel in the same hospital showed 122 affected out of 443 maniacs, monomaniacs, demented, &c. Brère de Boismont, Des Hallucinations (Paris, 1843); Aubanel and Thorne, Recherches Statistiques faîtes à l'Hôpital de Bicêtre; Michéa, Du Délire des Sensations (Paris, 1848). Hallucinations of Some Men.—In a large majority of cases, hallucinations can readily be traced to mental alienation, which is cognizable by other signs, or to conditions of the nervous system, which impair or pervert without overthrowing the mental; or to general constitutional states, or positive diseases, such as in the case of Nicolai, which involve disturbance of the functions of the external senses. There is, however, a class of phenomena which cannot be included under any of the above categories; where objects appear; voices tempt, threaten, soothe, or where a series of impressions are received by the mind, without any corresponding sensation; where the system is perfectly healthy, and where the individual affected is conscious that what he sees or hears is unreal. Medical experience, however, goes to show that under such circumstances the nerve, or some organ connected with the development of special sensation, or the brain itself, is in an abnormal or excited condition, which falls short of disease, not interfering with the regular discharge of the ordinary functions of these parts of the economy, and not being detectable in any way except by those who are sometimes compatible with great intelligence, and even greater knowledge. As with the other aspect of the latter proposition, and of the least meritorious aspect of such phantasmata, it may be mentioned that the late Earl Grey was haunted by a gory head, which could exorcise at will. Swedenborg, while at the head of the government, saw members of the heavenly hierarchy seated among the ministers at the council board, and bowed reverentially to them. Bernadotte encountered a woman in a red cloak in his rides; and a patient has been described who was followed first by a cat, then by a tatterdemalion beggar, and then by a skeleton which never left him, walked side by side, joined his family circle, and peered through his curtains at night. Yet Swedenborg knew that it was not flesh and blood realities he acknowledged; the king shrank from, but repudiated the red cloak; and the patient disbelieved the skeleton, and detected its true nature and origin, when the alarm passed off.

HALMALILLE (Berbera amomille), a tree of the natural order Tillacaceae, closely allied to the Lime or Linden tree of Europe, and much resembling it, but larger; a native of Ceylon, much valued for its timber, which is a favourite house-building wood in that island, and is employed also for plate work and all household purposes, and also for boat-building, as it is believed to resist the attacks of marine worms, and in virtue of a certainunctuosity, to preserve the ironwork from rust. It is exported to Madeira, and Ceylon, from which islands of exportation, it is known as Trincomali Wood—and the Masula boats, which brave the formidable surf there, are made of it. It is a light wood.

HALOGENS. This term, which is equivalent to 'salt-producers,' is derived from the Greek word halos, salt, and includes a very distinct and wellcharacterised group of non-metallic elements—viz., chlorine, bromine, iodine, and fluorine, which form with metals compounds analogous to sea-salt.

The following are their most important characteristics:

1. They combine directly and at an ordinary temperature with the metals, for which they exhibit a very strong affinity; and their combinations with the metals present those properties which pertain to Salts (q. v.). No elements excepting the four possess the property of entering into direct combination with metals, and of thus forming salt-like compounds. When united with the same metal, the salts which the different halogens form are isomorphous; thus, for example, the chlorides, iodides, bromide, and fluoride of potassium all crystallise in cubes.

2. They all have a very energetic affinity for hydrogen, with which they unite in one definite proportion—viz., 2 volumes of the gas or vapour of the halogen with 2 volumes of hydrogen, the union occurring without change of bulk, that is to say, being represented by 4 volumes, and the resulting gaseous compound being intensely cold, and very soluble in water. The acids thus formed are hydrochloric, hydrobromic, hydriodic, and hydrofluoric acids. Moreover, all these halogens (except fluorine) form powerful acids with five atoms of oxygen—viz., chlorous, bromous, and ioous acids, and their salts present numerous points of resemblance.

HALOID SALTS. These are the compounds formed by the union of one of the Halogens (q. v.) with a metal. We may mention chloride of sodium
HALORAGIACEAE.—HALOS.

(NaCl), bromide of silver (AgBr), fluoride of calcium (CaF), and iodide of potassium (KI), as examples.

HALORAGIACEAE, OR HALORAGACEA, a natural order of exogenous plants, closely allied to Onoclea (q. v.).—There are about seventy known species, herbaceous or half-shrubby; pretty much scattered over the world, but almost all aquatic, or growing in wet places. The stems and leaves often have large sori, or sporangia. The flowers are generally small, and the plants insignificant in appearance. Nor have any of them any important uses, except those of the genus Truncatum (q. v.). The only British species are the Mare's Tail (Hipparis vulgaris) and the Watermilfoil (Myriophyllum). The characters which have been breathed upon, or dusted with Lycepodium seed. If the diffusing particles be all of the same size, the rings are very well marked; but since they become smaller as the particles increase in size, ordinary fogs and clouds, which generally contain particles of very different dimensions,give a composite effect, which spoils the distinctness, and greatly limits the number of the rings. Thus, no general rule can be given for the number or colours of the corona, but it may be observed that the visibility of a uniform and comparatively large size of the particles of the air, with the exception of the water-carried sand, is very greatly increased when the latter is small and numerous. The optical explanation, founded mainly upon reflection and interference, is complete, but not suited to our pages.

So far the phenomena depend merely on the cloud or fog consisting of small particles; nothing has yet been said about the shape of the particles. Spherical drops of water produce Rainbows (q. v.), and upon the vesicular form that moisture often assumes in the air, probably depend the blue of the sky and the gorgeous tints of sunrise and sunset. But the false halos (Gr. halos, mist, and the false parhelia (Gr. parhelos, beside, near) are formed by three suns) depend upon the presence in the air of innumerable crystal of ice, generally forming a light cirrus cloud. We cannot enter upon a complete explanation of these phenomena, but we shall give a general idea of their origin, referring the student who wishes a thorough knowledge of the subject to a memoir by Bravais (Journal de l'Ecole Polytech. nique, viii.), who has himself repeatedly witnessed and accurately measured the various appearances in question.

The theory of halos was first roughly attempted by Hurghens; but although his explanations are in the main correct (at all events, as regards the very simplest of the appearances), they are based on the utterly inadmissible supposition, that the halo-producing clouds are formed of cylinders of water, each having an opaque, frozen nucleus. It will be seen that the results of this supposition agree with those of the correct one in a few cases only. Further progress was impossible until the crystalline form and the refractive index of ice were observed. Both of these observations are of great difficulty; but they were both carried out by Wollaston and others with considerable accuracy. After Hurghens, Mariotte, admitting the crystalline form of ice-particles, made some great steps in advance, and much of what he left unexplained was successfully supplied by Young, and after him by Kaemtz. The most complete and systematic explanation of the whole subject, however, is that of Bravais, already referred to. There, references are given to nearly all the accurately recorded observations of halos and parhelia—the great mass of which, of course, are due to arctic voyagers, especially Scoresby and Parry.

Water-crystals in the form of regular hexagonal prisms, sometimes with plane ends perpendicular to the sides (as in fig. 1), sometimes with hexagonal pyramids as terminals (fig. 2). There is also an immense variety of much more complex forms; but upon the simpler and more common ones already mentioned, depend the ordinary cases of the phenomena we are about to describe. Now, if we consider a triangular prism, with a non-parallel face of one of the above crystals, it is clear that their combination must act as a prism, decomposing white light, which passes through them, into its constituent colours. Every such crystal, then, placed somewhere near the line joining the eye and sun, must in general send to the former some definitely coloured ray from each effective pair of surfaces. The refractive index, however, of ice is such that no ray can pass through a prism of it whose angle is greater than about 90°; and we are therefore limited to pairs of faces whose inclination is not superior to this. The most important pairs are two alternate faces of the prism (fig. 1), where the inclination is 60°, or a faceted prism with a terminal plane (fig. 1), the angle being 90°.

Halo of 22° Radius.—We may now suppose prisms of ice, with refracting angles of 60°, to be distributed (with every possible position of their axes) in the air between the sun and the spectator, and it is evident that the appearances produced must be symmetrical with regard to the line joining the eye and sun, and must therefore consist of coloured circles with the sun as centre. To attain a more

Fig. 1.  
Fig. 2.
HALOS.

exact idea of the nature of these circles, suppose that we are dealing with light of one colour only (say red). Now (see PRISM), if a beam of homogeneous light falls on a prism, it is refracted without separation. If the prism be turned gradually and uniformly, as remarked above, further from the sun as the sun is higher. Hence the formation of the parhelia consisting of two coloured images of the sun, at the same altitude as that body, and further beyond the halo as the sun is higher. Accurate measurements of the altitudes of the parhelia for different altitudes have been found to accord exactly with the results of calculation from the optical data. See PP (fig. 3).

The light reflected from the surfaces of the vertical prisms, of course appears to come from an image of the sun in a vertical mirror, which, by optical laws, must have the same altitude as the sun itself. Such images then form a white horizontal small circle, passing through the sun and the parhelia. This is often observed, and helps to corroborate the above theory of the coloured appearances. See the dotted line PSP (fig. 3).

The light reflected from the horizontal terminals of these prisms must evidently produce a white image of the sun, as much below the horizon as he is above it, and vice versa. This appearance is also common enough.

Tween Area to the Halo of 22°.—We have seen that in many cases the prisms of ice are so placed as to be hexagonal plates. Their natural position in falling will be edge foremost, or there will be a multitude of snow-crystals whose axes are nearly horizontal, but of course arranged in all directions in the horizontal plane. Let us consider all those whose axes are perpendicular to the line joining the spectator with the sun; these evidently (by an explanation similar to that of the parhelia given above) form parhelia on the halo at its upper and lower points. Another set, whose axes are also nearly horizontal and parallel, but slightly inclined to the former, will form parhelia to one or other side of the vertical plane passing through the sun, and on account of the obliquity of the incidence, the angle of deviation is increased, and these are outside the halo. They are further to the right or left of the sun’s vertical plane, and further outside the halo as the crystals are more and more turned in the horizontal plane. The complete result is a brightly coloured pair of arcs, which touch the halo at its upper and lower points, and lie completely outside. For certain elevations of the sun, these combine, forming a curve like an ellipse, whose centre is the sun, whose larger axis is horizontal, and which touches the halo externally at its upper and lower points.

Halo of 46°.—This depends upon the right-angled prisms, formed by combining a terminal plane with one of the faces of the hexagonal prism, and with the single exception of a different refracting angle, and its consequent greater dimensions, its explanation and its appearance are the same as those of the halo of 22°

Perhaps the most magnificent, both for brightness and separation of colours, of all the halos, is the coloured arc which touches the halo of 46° at its upper point. This depends entirely upon the refracting direction of light through the upper edges of prisms similar to fig. 1, and whose axes are vertical. It is therefore due to the same cause as the parhelia of the halo of 22°; and it is a remarkable proof of the truth of this, that this instance is recorded in which the former appeared without the latter; and its absence was then easily accounted for by the fact that no cloud of ice-crystals near enough to the sun to produce the parhelia. See fig. 3.
HALYARDS, the smaller ropes and tackles used in hoisting sails or other portions of a ship's equipment, are often called, when extended, a HALO plaited the best white hemp, passing through a pulley in the truck at the mast-head, or gaff-point, and thence to the deck; the flags when attached to them are rolled up, and then hoisted and expanded to the wind by a jerk when the proper moment arrives.

HALYBURTON, THOMAS, a Scotch divine, born 1674, died 1712. He was the author of several works, including Natural Religion insufficient, and Revealed necessity to Man's Happiness; The Great Concern of Salvation; and Ten Sermons preached peculiarly in this place, that Halyburton should be placed by. The works, especially the autobiographical memoir, of the 'Holy Halyburton' were once very popular among the people of Scotland; and even at the present-day their name is imitated not sufficiently by his brothers. It is a curious, and somewhat prophetic, that Halyburton should have a name that must have been more appropriate to his descendants than to himself, for we are not told, and there is no reason to believe, that he was the parent of his brother. In explanation of this, it is customarily urged that the names of Noah and his sons had 'prophetic significations'—an hypothesis which few feel to be altogether satisfactory.

HAM, a small town and fortress of France, in the department of Seine-et-Marne, and situated on the river of that name, is distant 36 miles east-south-east of Amiens, and about 79 miles north-north-east of Paris. It is of ancient origin; coins were struck here in the reign of Charles the Bald (840—977). The site was held by the Constable de Saint Pol in 1470, and now used as a state prison. Its walls are 39 feet thick, and its principal tower is 108 feet in height, and the same in diameter. It is memorable as the place of confinement of Marbegn, Moncey, and others; and subsequently of Boniface, Chanteraine, Peyronnet, and Guernon Ranville from 1831 to 1836; and of Louis Napoleon, the present Emperor of the French, from 1840 till 1846. After the Coup d'État of the 21 December 1851, the republican Generals Cavaignac, Lamoricière, Chagnihrn, and others were kept here for some time. Pop. 2554.

HARVEST, properly the hind part or angle of the knee; but usually applied to the cured thigh of the ox, sheep, or hog, more especially the last. Ham-curing, or, what is the same thing, bacon-curing, is performed in a variety of methods, each country
HAMADAN—HAMBURG.

or district having its own peculiar treatment; these, however, relate to minor points. The essential operations are as follows: The meat is first well rubbed with salt and either left on a bench that the brine may drain away, or covered up in a close vessel; after a few days it is rubbed again, this time with a mixture of salt and saltpetre, to which sugar is sometimes added, or with a mixture of salt and sugar alone. It is then consigned to the bench or tub for at least a week longer, after which it is generally ready for drying. Wet salting requires, on the whole, about three weeks; dry salting, a week longer. Ham hams should not be kept in pickling longer than 12 or 14 days. Some hams are merely hung dry without being smoked; others are removed to the smoking-house, which consists of two and sometimes three stories; the fire is kindled in the lowest, and the meat is hung up in the second and third stories, to which the smoke ascends through holes in the flooring. The fire is kept up with supplies of oak or beech chips, though in some districts, as in Westphalia, twigs of juniper, and in many parts of Great Britain, it is kept, are used. Fir, larch, and such kinds of wood, on account of the unpleasant flavour they impart, are on no account to be used. The fire must be kept night and day, in a smouldering state for about six weeks, at least, to such a height that, if the air is too dry, or five to six inches deep, it is perfectly cured.

As cold weather is preferable for this operation, it is chiefly carried on during winter. Many of the country-people in those parts of England where wood and peat are used for fuel, smoke hams by hanging them up inside large wide chimneys, a method common in Westmoreland. The curing of beef and mutton hams is carried on chiefly in the north of England and Dumfriesshire in Scotland; that of pork-hams, on the other hand, forms a large and important item in the industry of various countries. Westphalia, in particular, is celebrated for the delicacy and flavour of its smoked hams. The efficiency of wood smoke in preserving meat is due to the presence of pyroglycous acid. See PYROGLYCOUS ACID AND CLEOSOATE.

HAMADAN, an important town of Persia, in the province of Irak Ajemi, is agreeably situated at the northern base of Mount Elwin, 150 miles west of the city of Teheran, in lat. 38° and long. 49° 28' E. Its streets are narrow and dirty; but the trade and manufactures carried on impart to it a lively and bustling air. It contains numerous caravansaries, excellent and well-furnished bazaars, gardens, baths, and mosques, as well as two notable tombs, one that of the famous Arabian philosopher and physician Avicenna (q.v.), which draws numerous pilgrims to the town; and the other affirmed to be that of Mordecai and Esther. During four months in winter, the cold here is excessive, and feel with difficulty procured; throughout the rest of the year, however, the climate is delightful. Being the centre of converging routes from Bagdad, Erzerum, and Isphahan, it is a large transit trade. H. carries on extensive manufactures of leather; coarse carpets, woollen and cotton fabrics, are also made to some extent. Pop. varisazally estimated at from 10,000 to 40,000. Recent explorers have concluded, from historical evidence, and from the coins, inscriptions, and other remains found here, that H. occupies the site of the Median Ecbatana. See EcbATANA.

HAMADRYADS. See NYMPHS.

HAMAMELIDE. See WITCH Hazel.

HAMANN, Johann Georg, a very original theologico-author, who, on the expiration of his writings, called himself the 'Magician of the North,' was born at Königsberg, in Prussia, August 27, 1730. His early life was somewhat checkered; and a failure to acquit himself creditably in some business with which a merchant of Riga had intrusted him, induced him to abandon himself to dissipation, from which he was rescued by reading the Bible. He now devoted himself to the study of the most learned Oriental literature, and made the acquaintance of many eminent authors. He died at Münster, June 21, 1788. As an author, H. was little esteemed by his contemporaries, as he opposed the tendencies of the age, and defended the dignity of revelation against the attacks of the Rationalists, and was thus placed in opposition to the multitude of scholars. His language, besides, was figurative and symbolical in the highest degree, and frequently concealed, rather than revealed the depth of his thinking. But his unmistakable genius, and the rich suggestiveness of his ideas, were appreciated highly by Herder, Goethe, Jacob, Jean Paul, and other great men. The influence which he exercised upon Herder's views was very great. All his writings exhibit a deeply spiritual faith in the unseen and the eternal. Fragments of them were published by Cramer, under the title Sämtliche Werke, by F. Roth (7 vols. 1821—1823; an 8th vol., published by G. A. Wiener, Berlin, 1843, contains additions and explanations). His biography was published by E. H. Childsmeister (Hamann's Leben und Schriften, 3 vols., Gotha, 1857).

HAMBATO, a town of Ecuador, in South America, stands in lat. 1° 48' S. and long. 78° 56' W., at the north-east base of Chimborazo, with Coto- paxi, about 25 miles distant, in front. Its elevation above the sea is 8860 feet. At this altitude, wheat grows even under the equator. Though twice destroyed,—by an eruption of Cotopaxi in 1698, and by an earthquake in 1796,—H. has still a flourishing trade in grain, sugar, and cochineal, and contains about 12,000 inhabitants.

HAMBURG, the largest of the free cities of Germany, and the capital of a small republic of the same name, is situated in lat. 53° 21' 30" and long. 10° 58' E. H. possesses two distinct territories, the one exclusively its own property, and the other the joint property of Lubeck; to the former belong the city with its two suburbs, St. Peter and St. Paul, several islands on the Elbe, and a small tract of land enclosed by Holstein and the bailiwick of Ritz- bittel, in which lies the town of Cuxhaven; and to the latter, the township of Bergedorf, the village of Geesthacht, and the lands known as Vierlanden, 16 miles from Hamburg. The population, in 1860, was 229,941, of whom 176,000 belonged to the city and its suburbs, of whom about 10,000 were Jews. The city of H. is situated in a pleasant district between the Elbe and Alter, and about 75 miles from the German Ocean. At high-tide, vessels can come up the Elbe and unload in the harbours, while by means of the various canals (crossed by 84 bridges) lighters can carry the cargoes into the very heart of the city. H. is linked with the deep canal, 120 feet wide, communicating with the Elbe, and following the former line of fortifications; the ramparts have been replaced since 1819 by gardens and walls; but the gates of the city remain, and are shut every evening, after which a toll is demanded. H. is divided into the Old Town and New Town; but since the great fire of 1842, when fully one-fourth of the city, including most of its public buildings, had been burned down, its appearance has been greatly altered; and the present city is
remarkable for its fine, open, well-lighted, and well-drained streets, and its spacious and lofty houses. Among the churches, the principal is that of St Michael, which was built in the 18th c., and is distinguished for its tower, the loftiest in Europe (470 feet high); St Peter's, which has been recently rebuilt; and St George's, the foundation of which dates from the 14th c., but which was completely restored in 1742. H. is essentially a commercial city, in which merchants from various countries are settled; and so much is done to advance its interests as a central dépôt, that one is the more surprised to find two things in a very unsatisfactory state—its system of local currency, which is intricate and antiquated; and its extraordinary postal system, by which each country is left to have its own post-office, in place of there being one definite establishment for receiving and despatching letters. The Exchange is one of the most commodious in Europe, and contains, in addition to the usual banking-offices, reading-rooms, an excellent commercial library of 40,000 vols., with collections of maps, search-lists, &c. Among the numerous educational establishments of H., we may instance the Johanneum, a collegiate school, founded in 1528, in which is located the public library, with its 5000 MS. volumes; a Royal Commercial School, founded in 1767; the normal school for teachers; and the free schools which have been established in each of the five parishes. The observatory and botanical garden deserve mention; while the various literary and scientific societies, among which the Verein für hamburgische Geschichte, established in 1839, by the historian Lappenberg, is one of the most energetic, have proved valuable adjuncts to education, many of them having extensive libraries, in which are kept many of their own publications, which are rendered easy of access to all who wish to examine their contents. H. has an academy of painting and music, a gallery of paintings, two spacious theatres, and a larger number of public gardens and places of amusement than any other city of its size. Its charitable institutions are, however, proportionally numerous, and are for the most part imbued for their endowment and support by private benevolence. The most noted is the Jewish Hospital, founded by Solomon Heine in 1841, and thrown open to all Christians since the emancipation of the Jews in 1849; the great hospital in the suburb of St George, founded in 1809, with its 400 beds; the hospital for poor travellers, the wealthiest and oldest institution of the kind, and now appropriated to the maintenance of 142 aged persons; and the Rauhe Haus, which was founded at Horn, near H., in 1853, by John Heine. Wichern, for the improvement of depraved and abandoned children. H. ranks as the greatest emporium of trade on the continent, and next to London, has the largest money-exchange transactions in Europe. It is also one of the principal ports for transatlantic emigration, and the centre of a very extensive business in ship-insurances. Its most important branches of home-industry are ship-building, on a very large scale, and sugar-refining, distilling and dyeing, the manufacture of cigars, tobacco, sail-cloth, ropes, cutlery, and salting meat, chiefly for the English market, and for provisioning the ships that enter the harbour.

The value of the imports entered in H. in the year 1860 was 609,905,710 marcs banco (=£4,472,291l.), of which 58,312,890 ( = £2,251,981) belonged to transatlantic ports; 5220 sea-going ships, and 3372 river-boats, left the harbour in that year. The effective of the merchant fleet of H., at the close of 1860, was as follows: Sailing-vessels, 469; tonnage, 58,770 lasts (a last = 6000 lbs.) = 157,420 tons; steam-vessels, 47; tonnage, 4292 lasts = 12,123 tons. The budget for 1861 gave 10,230,287 marcs banco both for the receipt and the expenditure. The state debt was at the close of 1839, 62,064,925 marcs banco (£4,525,567), nearly half of which was incurred to meet the expenses of rebuilding the city after the fire of 1842.

The government of H. is in the hands of a moneyed aristocracy, and its constitution, which is based upon the principles established by an imperial commission in 1712, and confirmed by the German diet in 1815, after having undergone various modifications and important changes at different periods, was settled in 1860 as follows: The sovereign power to be exercised by the senate and the burgmers. The senate, which is specially charged with the executive, is to be composed of 18 members, 9 of whom must have graduated in law, and 7 of the remaining 9 must be engaged in commerce. The civic or legislative body is to consist of 192 members elected for 6 years, half the number going out every 3 years. This body elect the senators for life, and the latter annually elect from their own body a president. Cases in which the senate and the burgmers are both involved are referred to the supreme court of appeal at Lubeck. The judicial power is vested in special tribunals, and the administration divided into distinct departments. The proceedings of the senate and burgmers council are public, perfect transparency is enjoined. Every citizen is bound to perform military duty, and the city maintains a paid force of 2160 men, and a well-drilled burgher-guards of 10,000 infantry, cavalry, and artillery. H. has a combined vote with the Hanseatic towns in the German diet, and a separate vote in the 'Plenum.' Its contingent to the army of the German Confederation (q.v.) is 1298 men, while it is bound by the diet to maintain 1050 infantry, two companies of artillery, and one of horse, to garrison the city. The arms of the republic are a silver wall with three silver towers and an open gate on a red field, surmounted by a helm and flag in the midst of three peacock's feathers. The national colours are white and red.

H. began to attain some importance as a trading place in the 12th c., and was raised to the rank of a free city by the Emperor Otho IV. In 1241, it concluded a treaty with England (q.v.), and the Hanseatic League (q.v.), and from that time it increased rapidly in wealth and consideration, augmenting its territories by the purchase of Ritzebüttel and several villages in its vicinity. In the early part of the 16th c., the boundaries of the city were carried across to the western banks of the Alster, which were principally occupied by fugitives from the Low Countries. Disputes with the kings of Denmark, who, as Dukes of Holstein, claimed supremacy over some portions of the state, kept H. constantly embroiled in petty wars with its northern neighbour, until Denmark, in 1768, finally conceded its rights. The prosperity of the city continued to increase till the occupation of Northern Germany, by the French in 1803, when it underwent a series of misfortunes and insults, which culminated in the terrible siege which the French under Davout sustained within its walls in 1813—1814, when they drove 40,000 Hanseatic troops in the Neumark, and of whom perished of hunger. In 1815, H. joined the German Confederation as a free Hanseatic city, and since that period its commercial prosperity has been advancing with great rapidity, and shipping, and commerce, which the great calamity of the fire of 1842 scarcely checked even temporarily. See Kildén's Erdkunde; Wajans, 110.
HAMMELN-HAMILTON.

Hamilclin d. Geogr. und Statistik; Boedeker's Deutschland; and Almanach de Gotha, 1862.

HAMMELN, an interesting town, and formerly a fortress of Hanover, in the province of the same name, is beautifully situated on a commanding position on the Weser, at the confluence of the Hamme with that river, 25 miles south-west of Hanover. It is surrounded by a wall, formerly surmounted by 20 towers, and defended by a fort, which, however, was blown up by the French in 1666. It is irregularly built, and is full of wooden houses in the old German style; has three churches, including the Münster, a fine old edifice, dating from 1127, and now falling into ruin; and a large educational institution built in 1827. The channel-bridge at H., crossing the Weser, was completed in 1839, and is about 780 English feet in length. Pop. 7000, who are chiefly employed in brewing; in the manufacture of paper, cement, woolen goods, and carpets; and in agriculture, salmon-fishing, and general trade. In the earliest times, H. belonged to the Abbey of Fulda, and was a member of the Hanseatic Confederation.

HAMILCAR was a name borne by several distinguished Carthaginians, the most celebrated of whom were—1. The commander of the great Sicilian expedition, 434 B.C.; 2. One of the commanders of a Carthaginian army, defeated by Timoleon, the Corinthian general, at the Crimissus, 339 B.C.; 3. (surnamed Rhodanus), the ambassador to Alexander the Great after the fall of Tyre; 4. The governor of Sicily, 347 B.C.; 5. The son of Gisco, who succeeded the preceding, and carried on military operations against the Syracusans and other states with great success, but was at length taken prisoner, and put to death. 6. Commander during the first Punic War, who was very successful against the Romans by land in Sicily, but was afterwards defeated in a sea fight off Ecnomus, and was thereafter recalled to Africa to oppose Regulus.

But the greatest of all was H. surnamed Barca or Berab, i.e., 'lightning.' While very young, he was appointed to the command of the Carthaginian forces in Sicily, in 247 B.C., at which time the Romans had possession of almost all the island. H.'s first care was to discipline his infantry thoroughly; he then established himself on Mount Erice (now Poligroso, near Palermo), and from this point made pilaging excursions in all directions, sending his privates along the coast of Italy to Cumae, thus obtaining abundant supplies for his troops. From this position the Romans endeavoured to dislodge him, but in vain. After three years, he left Erice, and established himself on Mount Eryx, keeping up his communication with Drepanum and the sea, where the same tactics were repeated on both sides, and with the same want of success on the part of the Romans. But the Carthaginian admiral having been totally defeated off the Aegean Islands, 241 B.C., H. was compelled to abandon his fortress, and evacuate Sicily. While H. was engaged in Sicily, he had made large promises to his mercenaries, which he was unable to perform; they revolted in consequence, and were joined by some of the Hannibals. H. endeavoured to suppress the revolt, but failed; H. was accordingly appointed to the command, and succeeded in utterly defeating the rebels, capturing all their towns, and putting to death their leaders. H. was next appointed commander-in-chief of the Carthaginian army, and was engaged for some time in wars with the neighbouring tribes, which were abruptly ended by H.'s entering upon his Spanish campaign in (probably) 206 B.C., and in his great aim to found a new empire in Spain, from which, as his basis, he might assail the Romans. Such a kingdom he saw would increase the power and wealth of his native country, and to it he referred the first Sicilian and Sardinia. This his great purpose H. endeavoured to accomplish. He marched westward, while the fleet under his son-in-law, Hasdrubal, cruised along the coast; he then crossed over at the Strait of Gibraltar, and made war on the northemiers of Spain, in the course of which he penetrated to the very heart of the country, subdued many tribes and cities, and amassed immense wealth. He spent nine years in Spain, and at length, in 228 B.C., met his death on the field of battle while fighting against the Vettones. His military genius is considered scarcely inferior to that of his son Hannibal.

HAMILTON, a city of Canada West, is situated in the county of Wentworth, at the west end of Lake Ontario, or rather of that detached section of it which, under the name of Burlington Bay, is connected with the main body of the lake by the Burlington Canal. H. is 45 miles from the Falls of Niagara, 38 from Toronto, and 378 from Montreal. It is situated in the very centre of the finest grain-producing country in America, and is also an important centre of the chief Canada railways, the Great Western, the Hamilton and Toronto, and the Hamilton and Porter Dover lines. The rapid increase of its population is remarkable. In 1841, it was about 3500; in 1859, 10,212; and by the last census (1861), it is officially stated at 19,068. As a port of entry, H. was, in 1858, inferior only to Toronto within its own half of the colony. The manufacturing establishments of H. are extensive; the principal are locomotive-works, foundries, and car-works. The city returns one member to the legislative assembly.

HAMILTON, a parliamentary and municipal borough, and market-town of Scotland, in the county of Lanark, is beautifully situated on the left bank of the Clyde, in the centre of a finely wooded district, about 11 miles south-east of Glasgow, with which it is connected by railway. It has a straggling, but at the same time a pleasant rural appearance, many of the houses having a piece of garden-ground attached. The town contains twelve churches; numerous good schools—of which the Academy and St John's Grammar School are the most important; the county-hall, a noticeable Grecian structure; a new town-hall, and excellent carpenter's and smith's shops. Many of the females are employed in the manufacture of saddles and collars for the famed Muslim manufacturers of Glasgow. Pop. (1861) 10,686. — Close to the town is Hamilton Palace, the seat of the Duke of Hamilton and Brandon, with the family mausoleum, in the midst of extensive pleasure-grounds bordered by the Clyde. The palace is a large and noble structure, and contains an excellent collection of paintings. On certain days the grounds are open to the public. The old feudal stronghold is Cadzow Castle, and the remains of Cadvow Forest, in which a herd of the famous aboriginal breed of wild cattle are kept, are in the vicinity.

HAMILTON, THE FAMILY OF. This great historical family is known to be of English origin, but when or how it took root in Scotland has not been clearly ascertained. Some genealogists have sought to trace its lineage to Robert, surnamed Blanchuims, third Earl of Leicester, who died in 1190. There is nothing improbable in the claim of the 11th family of the Earl, that the second son of St Hugh, Bishop of St Andrews, who had other relations beyond the Tweed, and the cinquefoil on a bloody shield, which was the heraldic bearing of his house, seems from an early period to have been the heraldic bearing of the Scottish Hamiltons. But however probable such a descent may be, it wants proof. The name of the
HAMILTON.

family, obviously territorial, was doubtless taken from some one of the many English manors called Hamilton, scattered through Buckinghamshire, Hampshire, Surrey, Lancashire, Rutlandshire, Yorkshire, and Leicestershire. In the 17th c., the Leicestershire Hamilton—a petty manor in the parish of Barkby, containing only a shepherd's cottage—was shown as the cradle of the house. Several persons of the name of Hamilton appear both in English and in Scottish records about the middle of the 13th c., and at that period, as we have seen, who held the Yorkshire manor of Hamilton, together with lands in the parish of Oxnam, in Scotland. But the pedigree of the family cannot be carried beyond (1), the elder brother of Sir Gilbert (2) of Hamilton, who, in 1296, held lands in Lanarkshire, and swore fealty to King Edward I. of England as Overlord of Scotland; and in 1314 kept the castle of Bothwell, on the Clyde, for the English. His early surrender of this strong fortress, and of the English knights and nobles who had fled to it from the field of Bannockburn, was rewarded by King Robert Bruce by grants of the lands and baronies of Cadyow and Macheshan in Clydesdale, Kinneil, and some of the West Lothian, Kirkovan and Kikrowan in Galloway, and other lands forfeited by the Cambus and other adherents of England. He attained the rank of knighthood, and married Mary, daughter of Sir Adam of Gordon of Huntly, by whom he left two sons. The eldest (2), Sir David, Fitz-Walter Fitz-Gilbert, or, as he was sometimes more simply called, 'Sir David Fitz-Walter,' or 'Sir David of Hamilton,' was taken prisoner by the English in the battle of Neville's Cross in 1369, and founded a chantry in the cathedral of Glasgow in 1361, and appears among the barons in the Scottish parliaments of 1368, 1371, and 1373. His eldest son (3), 'Sir David of Hamilton of Cadyow,' died before 1392, leaving by his wife, Janet of Keith, only daughter and heiress of Sir William of Keith of Galston, five sons and a daughter. The eldest son (4), 'Sir John of Hamilton of Cadyow,' married Janet, daughter of Sir James of Dougall of Dalkeith, by whom he was the father of (5) 'Sir James of Hamilton of Cadyow,' who, about 1422, married Janet, daughter of Alexander of Livingston of Callander, by whom he had (6) 'Sir James of Hamilton of Cadyow,' and four other sons. From, Sir Edward of Arran, Duke of CHATELHERAULT, MARQUESSES OF HAMILTON, DUKES OF HAMILTON, DUKES OF BRANDON, &c.—Hitherto the family had been only knightly. It was ennobled in the sixteenth generation, in Sir James of Hamilton of Cadyow, who, in 1445, was created Lord Hamilton by a charter which erected his manor place of 'the Orchard,' in the barony of Cadyow, into his chief messuage, and gave it the name of Hamilton, which it still bears. It is to the praise of the first Lord Hamilton that, in 1460, he founded a college in the university of Glasgow—the first college in Scotland founded by a layman. Allied both by marriage and by descent to the Douglases, he followed their banner in the beginning of their great struggle with the crown. But he forsook them at a critical moment in 1454, and his venal loyalty was rewarded by large grants of the forfeited lands, and, at a later period, when he might have been well advanced in years, by the hand of the Princess Mary, the eldest daughter of King James II., and the widow or divorced wife of Thomas Boyd, the attained Earl of Arran. Lord Hamilton survived his marriage only five years, and died in 1479. His only son, James, second Lord Hamilton, was, in 1508, made Earl of Arran, and had a grant of that island, the dowry of his mother on her first marriage. After playing an important part in public affairs during the minority of King James V., he died in 1529, being succeeded by his eldest son of his third wife (a niece of Cardinal Beaton), James, third Lord Hamilton, second Earl of Arran. The death of King James V. in 1542 left only an infant of five days old between him and the throne. He was at once chosen regent of the kingdom and tutor to the young queen, and declared to be 'second person in the realm'—a position which carried with it something of royal style. He signed documents as 'James, by the grace of God, Earl of Arran and Lord Hamilton, Governor and Prince of Scotland.' He held his high offices long after the ascension of Mary, Queen of Scots, in favour of the queen-mother, Mary of Guise, receiving in return, from King Henry II. of France, a grant of the duchy of Chatelherault. His nearness to the throne, his great following, and large possessions, left him still a person of such mark that his eldest son, the Earl of Arran, as he was called, was proposed at one time as the husband of Queen Mary of Scotland, and at another time as the husband of Queen Elizabeth of England. The career which opened with such high promise, and which lasted for so long, was marred by the earl's affections with madness in 1562, and never recovered his reason, although he lived till 1609. His father, the first Duke of Chatelherault, dying in 1575, his second son, Lord John Hamilton, the heir-apparent, succeeded his father, and became the head of the house, and as such was, in 1599, created Marquis of Hamilton. He died in 1604, being succeeded by his son James, the second marquis, and, in 1629, was created Earl of Lanark, and was created Duke of Hamilton, in England, and died in 1625. He was succeeded, by his eldest son James, the second marquis, who led an army of 6000 men to the support of King Gustavus Adolphus of Sweden in 1631—1632, and in a few years later another conspicuous part in the great contest between King Charles I. and the Scottish Covenanters. That king, in 1643, created him Duke of Hamilton, with remainder to the heirs—female of his body, in the event of the death of himself and his brother without male issue. In 1648, he led a Scottish army into England for the king's relief, but was encountered and defeated by Cromwell at Preston, in Lancashire. He escaped from the field of battle, but soon afterwards was taken prisoner for himself and some other prominent parlia-mentary forces. He was beheaded at Westminster in March 1649, when he was succeeded by his brother William, who, in 1639, had been created Earl of Lanark. He died in 1651 of the wounds which he had received at the battle of Worcester. The duchy of Hamilton, in terms of the patent of creation, now devolved on the daughter of the first duke, Lady Anne, whose husband, Lord William Douglas, Earl of Selkirk, was, in 1660, created Duke of Hamilton for life. He died in 1694. The Duchess Anne, who survived till 1716, had, in 1698, resigned her titles in the king's hands in favour of her eldest son, James, Earl of Arran, who was now created Duke of Hamilton with the precedence of 1613. In 1711, he was created Duke of Brandon in England, but the House of Lords refused him a seat or vote in parliament, on the ground that the crown was disabled by the Act of Union from granting a peerage of Great Britain to any person who was a peer of Scotland before the Union. The duke was killed in a duel at Hyde Park with Lord Mohun in 1712. He was succeeded by his eldest son, James, who died in 1743, being succeeded by his brother, James, who, in 1752, married the famous beauty, Elizabeth Gunning, and died in 1758, being suc-ceeded by his eldest son, James George, an infant of three years old. On the death of the Duke of
HAMiLTON.

Douglas in 1761, the male representation of the 'red' or Angus branch of the Douglases, with the titles of Marquis of Douglas, Earl of Angus, &c., devolved on the Dukes of Hamilton, as descendants of the Duchess Anne's husband, William, Earl of Selkirk, third son of the first Marquis of Douglas. Dying in 1799, in his 53rd year, James George, seventh Duke of Hamilton, was succeeded by his eldest son, William, in 1822, when he was seated in parliament as Duke of Brandon, the House of Lords being now satisfied, after consultation with the twelve judges, that the Act of Union did not prohibit the crown from making a peer of Scotland a peer of Great Britain. Duke Douglas died without issue in 1799, when the titles and estates passed to his uncle, Archibald, the second son of James, the fifth duke. Duke Archibald, dying in 1819, was succeeded by his eldest son, Alexander, who, in 1810, married a daughter of Mr. Beckford of Fonthill, and died in 1852, when he was succeeded by his only son, the present duke, William Alexander Anthony Archibald, eleventh Duke of Hamilton in the peerage of Scotland, eighth Duke of Brandon in the peerage of Great Britain, and fourteenth Duke of Chatelherault in the peerage of France.

LORDS PAISLEY, LORDS ABERCORN, EARLS OF ABERCARN, LORDS STIRKAYE, VISCOUNTS STIRKAYE, VISCOMTS HAMILTON, MARQUISSES OF ABERCORN, &c.—Lord Claud Hamilton, fourth son of the first Duke of Chatelherault, was appointed commissary of the abbot of Paisley in 1563, created Lord Paisley in 1597, and died in 1622. During his life, his eldest son, James, was made Lord Abercorn in 1603, and Earl of Abercorn in 1606. He had large grants of lands in Ulster; and dying in 1618, was succeeded by his eldest son, the fourth Earl of Abercorn, who in 1646, created Lord Strabane, the present peer. The sixth Earl of Abercorn, was, in 1701, created Viscount Strabane in the peerage of Ireland. The eighth Earl of Abercorn, then one of the sixteen Scottish representative peers, was, in 1796, created Viscount Hamilton in the peerage of Great Britain; when the House of Lords found, by a vote of 32 to 38, that a peer of Scotland who had been created a peer of Great Britain, could not sit in parliament as a representative peer. The peer of the same male blood, the ninth Earl of Abercorn, was, in 1799, created Marquis of Abercorn. He was, in 1839, created Lord Abercorn. It was ruled in his case, by the House of Lords, in 1798, that a peer of Scotland, who had been created a peer of Great Britain, could not sit in the House of Commons. Sir John, the first natural son of the seventh Earl of Abercorn, was, in 1658, the eldest of the five ministers of the Scottish representative peers. On the death of the second Duke of Hamilton in 1651, the second Earl of Abercorn had claimed the male representation of the House of Hamilton; and in 1651, the second Marquis and tenth Earl of Abercorn was served male of the first Duke of Chatelherault, in the Sheriff Court of Chancery at Edinburgh, under protest by the Duke of Hamilton, Brand, and Chatelherault. Lord Abercorn is one of three peers who hold peerages in Scotland, in Ireland, and in Great Britain; the others being the Marquis of Hastings (Earl of Londoun in Scotland, Lord Grey de Bathyn, &c. in England, Earl of Mora in Ireland, Lord Hamilton) and Lord of the Chamber, who died in 1674, from his eldest son, Viscount Cornely in Scotland and Viscount Grimenton in Ireland, Lord Viscount in Great Britain. The House of Abercorn gave birth, in 1666, to Anthony Hamilton, the 1666, lord of this charming Ménage de Comte de Gramont. He was the third son of Sir James Hamilton, fourth son of the first Earl of Abercorn.

EARLS OF SELKIRK.—Lord Charles Hamilton, third son of the first Earl of Hamilton, was, in 1658, on his father's resignation of the title, created Earl of Selkirk, with the precedence of 1646. Dying childless in 1739, he was succeeded by his brother, Lord John Hamilton, Earl of Ogilvy, who died without male issue in 1744, when the title of Earl of Selkirk passed to his grand-nephew, Dunbar Hamilton of Baldoon (the grandson of Lord Basil Hamilton, sixth son of Anne, Duchess of Hamilton). He died in 1799, and was succeeded by his son Thomas, who, dying in 1820, was succeeded by his son Dunbar James, the present and sixth earl.

EARLS OF ORKNEY.—Lord George Hamilton, fifth son of Anne, Duchess of Hamilton, was, in 1696, created Earl of Orkney, with remainder to the heirs male of his body. He died in 1737, he was succeeded by his eldest daughter, whose great-grandson, Thomas John Hamilton Fitzmaurice, is now fifth Earl of Orkney.

EARLS OF RUGLEN.—Earl John Hamilton, fourth son of Anne, Duchess of Hamilton, was, in 1697, created Earl of Ruglen, with remainder to the heirs male of his body. He succeeded to the title of Earl of Selkirk on the death of his brother in 1739, and died in 1744, when the title of Earl of Selkirk went to his grand-nephew, the title of Earl of Ruglen went to his eldest daughter, Anne, the widow of William, second Earl of March. On her death in 1748, the earldom of Ruglen devolved on her son, William, fourth Earl of Selkirk, and fourth Duke of Queensberry; and on his death in 1810, the title of Earl of Ruglen became extinct.

EARLS OF HADDINGTON.—Sir Walter Fitz-Gilbert, the first ascertainet ancestor of the House of Hamilton, had a brother, Sir John Hamilton of Rossaven, the progenitor of the family of Fingalton and Preston, which, in 1798, gave birth to Sir William Hamilton, the present Earl Hamilton. He died in 1820, and was succeeded by his eldest son, the present Earl of Haddington. The eldest of the present family is now tenth Earl of Haddington.

LORDS BARGENY.—Sir John Hamilton of Bargeny, and Carriden, the illegitimate son of the second Marquis of Hamilton, was, in 1638, created Lord Bargeny. The title became dormant or extinct on the death of the fourth lord in 1736.

LORDS BELHAVEN AND STENTON.—Sir James Hamilton of Belhaven and Stenton was created Earl of Belhaven and Stenton in 1647, and was, in 1736, created Lord Belhaven and Stenton, with remainder to his male issue. He died in 1797, and was succeeded by his eldest son, the present Earl Belhaven and Stenton, who, in 1836, created Lord Belhaven and Stenton in 1797, when he had a new patent creating him Earl Belhaven and Stenton for life, with remainder after his death to the husband of one of his granddaughters, John Hamilton (son of Robert Hamilton of Barmeluth, a judge of the Court of Session). This gentleman, who succeeded to the title and estates in 1679, distinguished himself by his wild but eloquent speeches against the Union. He died in 1678, and was succeeded by his son John, who, being drowned in 1721, was succeeded by his son John, who died in 1777, without male issue. His eldest daughter, Mary Bruce-Nisbet-Hamilton, wife of the Right Hon. Robert Adam Christopher-Nisbet-Hamilton. The titles were, in 1799, adjudged by the House of Lords to William Hamilton of Wishaw (as descended from the House of Barmeluth). He died, Robert Montgomery Hamilton, seventh Lord Barmeluth, and
HAMILTON.

Scot. Ind., in 1831, created Lord Hamilton of Wishaw, in the peerage of the United Kingdom. 

Viscounts Boyle.—Gustavus Hamilton, the grandson of Lord Claud Hamilton, first Lord Paisley, was, in 1715, created Lord Hamilton of Stackallan, and, in 1717, Viscount Boyle, in the peerage of Ireland. His descendant, Gustavus Frederick Hamilton Russell, is now the seventh viscount.

Viscounts of Clanbrassil, Earls of Clanbrassil, &c.—James, son of Hamilton, was natural son of Archibald Hamilton of Raplochy, vicar of Dunlop, in Ayrshire, settled in Ireland about 1587, and, in 1622, was created Viscount Clanboy. His son James was created Earl of Clanbrassil, and (the grandson of Hans Hamilton, vicar of Dunlop,) was, in 1677, and in 1705, and in 1756 was made Earl of Clanbrassil in the peerage of Ireland. Dying in 1738, he was succeeded by his son James, on whose death, in 1799, the title became extinct. His eldest son, Anne, the Countess of Limerick and Lord Clanboy, was, in 1821, created Lord Clanbrassil in the peerage of the United Kingdom.

A Brief Account of the Family of Hamilton, written by Dr James Baillie of Carnbrow, during the first half of the 17th c., is preserved among the MSS. in the Advocates' Library at Edinburgh. A History of the House of Hamilton, written about sixty years afterwards by Hamilton of Wishaw, is not now known to be extant. Memoirs of the Lives and Actions of James and William, Dukes of Hamilton and Claverhouse, by Gilbert Burnet, afterwards Bishop of Salisbury, were published in 1677, and in 1695, in 12 vols. Mr John Anderson, surgeon at Hamilton, published Historical and Genealogical Memoirs of the House of Hamilton at Edinburgh in 1825, in 1 vol. 4to.

HAMILTON, Alexander, an eminient American statesman, was born in the island of Nevis, one of the Lesser Antilles, 11th January 1757. His father was a native of Scotland, and his mother, whose maiden name was Faucette, was of French Huguenot extraction. As he early manifested an aspiring disposition, his extraordinary powers of mind and friends were induced to send him to New York, to be educated at Columbia College, which he entered in 1773. When only eighteen years old, he wrote several essays on the rights of the colonies, exhibiting so much vigour and grasp of intellect, that they were at first ascribed to Mr Jay, one of the ablest statesmen of that period, and then in the meridian of his powers. From that time, H. began to be regarded as one of the prominent leaders in the cause of independence. In March 1776, he was appointed a captain of artillery. He soon after attracted the notice of Washington, by whom he was appointed aide-de-camp, with the rank of lieutenant-colonel. From this date, during the close of the war, he was the inseparable companion and trusted counsel-ler of the commander-in-chief, who speaks of him as his 'principal and most confidential ad.'

In 1789, H. was married to a daughter of General Schuyler, and not long after resigned his position as member of Washington's staff, though he still continued in the army. He led, at his own request, the detachment which carried by assault one of the British outworks at Yorktown, Oct. 14, 1781. After the close of the war, he established himself as a lawyer in New York, and soon rose to the highest rank in his profession. In 1787, he was chosen a delegate from the state of New York to the convention which assembled in May, in Philadelphia, for the purpose of framing the constitution of the United States. In October 1787, H. commenced the publication of a series of essays under the name of The Federalist, designed as a vindication of the constitution of the United States. Many of his various opinions which had been made to it. Of these essays, amounting in all to eighty-five, a few were contributed by Madison and Jay, but by far the greater portion were written by H. They are justly considered as forming one of the best, if not the very best of the works which have been written on the scope and true interpretation of the Federal constitution. Washington having been chosen the first president of the United States (1789), appointed H. secretary of the Treasury. Under his able management, the public credit was raised from a state of utter prostration to the highest point, and H. justly acquired the reputation of being one of the greatest financiers of the age. His official reports to Congress are regarded as models of their kind. In 1793 he resigned his position in Washington's cabinet, and retired into private life. He died in 1795, having been, in 1786, created Earl of Clarendon, and in 1797, H. became commander-in-chief of the army. In July 1804, in consequence of a political difference, which became on the part of his antagonist a bitter enemy, H. was mortally wounded in a duel by Aaron Burr, and died the following day. The intense and almost universal sorrow caused throughout the country by this sad event, has contributed powerfully to bring the practice of duelling into disrepute, especially in the northern states.

The Works of Alexander Hamilton, in 7 vols. 8vo, edited by his son, John C. Hamilton, were published in 1851. This edition does not include The Federalist.

HAMILTON, Anthony, Count de, descended from the Scottish ducal family of that name, was born in Ireland in the year 1646. After the execution of Charles I., he, with his parents, followed the royal family to France. On the accession of Charles II. in 1660, he returned to England, but was exiled from office as being a Catholic. James II. restored H. to a regiment of infantry in Ireland, and made him governor of Limerick; but after the abdication of that monarch, H. returned to France, where he passed the rest of his life, and died at St Germain-en-Laye in 1729. His writings are full of wit and criticism, and particularly his letters to St. Germain (3 vols. Paris, 1805). His Mémoires de Grammont is a lively and spirited production, exhibiting a free and faithful delineation of the court of Charles II. It has been often translated into English. The last edition is that in Bohn's Series, with Scott's notes and illustrations. One of the best editions of his collective works is that published by Renouard (3 vols. Paris, 1812).

HAMILTON, Patrick, one of the most prominent precursors of the Scottish Reformation, was a younger son of Sir Patrick Hamilton of Kincaivel and St Andrews, former Bishop of St Andrews and Laird of the Manor of Hamilton, son of Alexander, Duke of Albany, second son of King James II., and, in all probability, was born in the year 1504, and in the city of Glasgow. He was educated at the university of Paris, where he took his degree in 1520, after which he proceeded to Louvain, where he remained for some time, and thence removed to Baslé in 1521.

When H. settled in St Andrews in 1523, he bore arms with the men of war and the arts of science which he had learned to cherish. For some time, his opinions attracted no particular attention. He quietly pursued his theological studies, and did not
HAMILTON.

as yet venture to put himself forward as a reformer. He had been appointed in his boyhood Abbot of Furness, although a priori he denied this residence or lived as a monk, he was content to enjoy the advantages and dignity of his ecclesiastical position. But gradually his convictions matured. From agreeing with Erasmus, he came to agree with Luther; and about 1520 he appears to have announced his new views in such a manner as to draw the notice of the Archbishop Beaton. Early in 1527, Beaton made 'inquisition' into the grounds of the rumour against him, and found that he was 'infamed with being disputing, holding and maintaining diverse heresies of Martin Luther and his followers, resurgent to the faith,' and thereupon proceeded to 'desire' him to be formally summoned and put to trial. In the following year, he carried out his summons by a professed trial and conviction declaring him to be worthy of death. In the meantime, H. had fled to Germany, where he became familiar with Luther and Melanchthon. The Protestant education of H. was in this manner very complete. Such a man, while he became a reformer, became one in no sectarian sense. His doctrinal opinions were characterized by something of the cosmopolitan breadth which marked his training, and by a scriptural simplicity befitting his unique and persevering spirit of inquiry. The substance of his doctrines has been fortunately preserved by his own pen under the title of Patrick's Places; and simplicity, combined with comprehension and apostolic bravery, may be said to be the chief characteristics of them.

After a residence of six months, H. returned to his native country. He repaired to the family mansion at Kincavel, and there, in the neighbourhood of Edinburgh, he contrived the only preaching of the Reformation. It is more remarkable, he is supposed, during this brief period of quiet and retirement at Kincavel, to have married. It is somewhat strange that, following such an event, he should have been induced to quit his retreat, where he was in comparative safety, and proceed to St Andrews. Beaton, however, contrived to allure him within his grasp. He 'travelled with the said Mr Patrick,' Knox says, 'till he got him to St Andrews.' It appears to have been held out of some good being effected by a conference with him as to the state of the church and its need of reformation; for 'reformation' of some kind was a common talk at this time in the church, and many plans were considered, and some attempted for carrying it out.

H. arrived at St Andrews in January 1528, and took up his abode in a lodging provided for him by the archbishop. A conference was held, in which his opponents showed a conciliatory spirit, and even to some extent expressed concurrence in his views. No advantage appears to have been taken of his former summons and condemnation. He was allowed openly, for some time, to promulgate his sentiments in the city and university. With all visitors he freely conversed, and among these, with Alexander Alane or Alesius, at this time one of the canons in the priory, and with Alexander Carmichael, one of the Dominian friars, 'a young man of good wit and learning,' suborned, it is alleged, by Beaton, to entrap him into avowals of heretical opinion. After a month or so (plus minus medium, says Alesius), he was summoned to answer before Beaton to a charge of heresy. The trial took place on the last day of February, and the result, in spite of his luminous and unanswerable argument was, that H. was condemned for divers heresies and 'detestable opinions'—deprived of all dignities and benefices in the church, and delivered over to the secular power to be punished. The sentence was carried out without delay. The warrant of the secular power must have been already secured, for on the very same day on the morning of which he was tried, H. was consigned to the stake in the front of the gate of St Salvador's College. He died as he had lived, a humble, earnest, heroic man. His character, if it scarcely attained to greatness in his brief lifetime, yet shone with a chaste and magnanimous lustre through the fires of his early martyrdom. His death probably did more to extend the Reformation in Scotland than even his life could have done. The 'reign of Mr Patrick Hamilton,' said one of Beaton's own retainers, 'has infected as many as it did blow upon.'

HAMILTON, Sir William, of Preston, Bart., the most learned and scientific philosopher of the Scottish school, (see Discourses, 2d ed., p. 739, note). He left Oxford in 1812, and entered the Scotch bar in 1813, but he seems never to have had any practice in his profession except what became incident on him afterwards, on being appointed crown-solicitor of the court of Session. About the death of Dr Brown, he was an unsuccessful competitor for the chair of Moral Philosophy in Edinburgh. In the following year, however, H. was appointed to the professorship of History by its patron, the Duke of Albany. H. had now reached his 30th year, without giving to the world any indication of those speculations which he had been silently and slowly maturing. But in 1829 there appeared in the Edinburgh Review a critique of Cousin's Course de Philosophie of the previous year, in which was developed that philosopher's doctrine of the Infinite. The critique immediately excited admiration not only among the few in our island who comprehended it, but much more extensively on the continent. Cousin himself being among the first to acknowledge that his reviewer at once understood thoroughly the theory which he opposed, and combated it with a speculative power, with a knowledge of his systems, and a command of philosophical expression, which he had not expected to find existing in Britain. For some years after this, H. was a regular contributor to the Edinburgh Review. Besides other philosophical articles, two of which, on the Philosophy of Perception, and on Recent Publications in Logical Science, are especially celebrated, he contributed several on education and university reform. Many of these contributions, besides being republished in Mr Crosse's Selections from the
HAMILTON.

Edinburgh Review, were translated into German, French, and Italian, the French collection, Fragmenta de Philosophie, being especially valuable for the introduction, appendices, and notes of its editor, M. Peisic. In 1832, they were all edited by H. himself, with large notes and appendices, under the title of Discussions in Philosophy and Literature, Education, and University Reform. In 1836, after a period of illness, he was elected to the chair of Logic and Metaphysics in Edinburgh. During his first session, he delivered a course of lectures on Metaphysics, which was followed in the succeeding session by a course on Logic; and these two courses he continued to read on each alternate year till the close of his life. His influence soon began to shew itself in the university among the young men who were attracted thither from different parts of Scotland, and other countries, in many cases chiefly for the sake of hearing H.; and many of his pupils, now rising to distinction in various professions, trace to the impulses which issued from his class the most valuable element of their education. Extensive notes of his lectures were taken by his students, and numerous copies of them, transcribed from short-hand reports, were in circulation during the latter years of his life. Since his death, they have been published under the editorship of Professors Mansel and V. (Sir William Mansel lectures, 4 vols. 1859—1861). These lectures, which were mostly written during the currency of the sessions in which they were first delivered, want the finish and polish of thought and expression which render the works revised by himself for publication models of philosophical composition; but this may be said to convey higher value to them as introductory works. Still it is to be regretted that the mass of ideas developed in these volumes were never, as was intended, wrought into another work which H. had already planned at the time of his appointment. This was his edition of the works of Reid, with notes and supplementary dissertations. It is perhaps impossible to adduce an example of any writing which has received the same amount of editorial care. The general aim of H.'s whole philosophy is, in fact, but the special aim of this edition of Reid. His conviction was, that the philosophy of common sense represented in the highest spheres of human speculation, and he sought, accordingly, in his annotations of Reid's writings, as in his independent works, to point out the relation of the Scottish philosophy to the systems of other countries, as well as to translate it into a more scientific expression, that he might bring into clearer view at once its true character and the real basis on which it rests. In this, therefore, more than in any of his other works, he betrays his fondness for eliciting his own theories from the hints of previous thinkers; his peculiar doctrines of perception, of the conditioned, of mental reproduction, &c., are traced to the writings of Aristotle. Valuable, however, as this work is, its latest edition contains references to numerous dissertations beyond that, in the middle of which it abruptly stops. This is undoubtedly to be attributed to the decay of H.'s health. By the paralysis of his whole right side, though his mind continued unimpaired, his public work was practically curtailed during the later years of his life. He was, however, generally able, with an assistant, to perform the duties of his class till the close of session 1855—1856, when his health suddenly became worse, and he died 6th May.

The time has scarcely come for estimating the position of H. in the history of philosophy. Though his system professes to be merely an exaltation of the Scottish philosophy, and seems to its ability creating an independent school, and, indeed, it may be questioned whether all his exegetical skill has vindicated the position claimed for Reid, whether, therefore, it would not have been better for H. had he not speculated in the metaphysics. His philosophy is distinguished in general from previous Scottish speculations by its more rigorously systematic character, it ventures, as in his doctrines of the conditioned, into realms of thought, whose existence had been denied by any of his countrymen. This doctrine, which limits positive thought to the conditioned sphere between the contradictory poles of the infinite and the absolute, has attracted more attention than any of his other doctrines, especially since the publication of Mr. Manuel's 'Brompton Lectures' in 1858; and though H.'s discussion is confined to the metaphysical aspects of the question, and is perhaps incompatible with a consideration of the ethical ideas which must be embraced in our conception of the Infinite Being, it is likely for some time to gather round it the higher efforts of British speculation. H. is also worthy of being distinguished by his important contributions to logic. These may be reduced to the two principles (1) of distinguishing reasoning in the quantity of extension from reasoning in that of comprehension, and (2) of stating explicitly what is thought implicitly; from the former of which issues his Modernlogic, in which he uses the most abstract and comprehensible terms, as of major and minor premises; from the latter the quantification of the predicate, the reduction of the modes of conversion to one, and his numerous simplifications in the laws of syllogism.

HAMILTON, Sir William, grandson of William, third Duke of Hamilton, born in Scotland in 1730, was in 1794, appointed English ambassador to the court of Naples. During his residence there, he took an active part in the excavation of the ruins of Herculanenum and Pompeii, and collected a rare assortment of art-relics, consisting chiefly of Greek and Etruscan antiquities, which was afterwards purchased for the British Museum. He was recalled to England in 1800; but while on his way home the vessel in which he sailed was unfortunately wrecked, and a great part of his collection of antiques lost. Drawings of these had, however, been preserved, which were afterwards published in his Antiquités Etrusques, Orycques, et Romaines, tirées du Cabinet de M. Hamilton (4 vols. Naples, 1768). He also published Discourses on Mount Evans, and the Eternal Emu, &c. (London, 1773); Campi Phlegraei (Naples, 1778—1777), &c.; besides some papers in the Philosophical Transactions (London, 1787—1798). H.'s claim on the British government for special services was disallowed, and he died at London in comparative poverty, 6th April 1803. The wife of H. was the notorious Lady Hamilton, whose name figures unpleasantly in the biography of Lord Nelson. She died at Calais in 1816, and her Memoirs have been published.

HAMILTON, Sir William Rowan, LL.D., one of the few really great mathematicians of the present century, was born in Dublin in August 1805. From his infancy he displayed extraordinary talents, having at the age of 13 a good knowledge of thirteen languages. Having at an unfavourable age taken to the study of mathematics, in his 15th year he had mastered thoroughly all the ordinary university course, and commenced original investigations of so much importance, that Dr Brinsley, the great mathematician, took him under his especial patronage. His earlier essays, connected with contact of curves, and caustics, grew by degrees into an elaborate treatise on the Theory of Systems of Rays, published to be the rival of Descartes in 1823. To this he added various supplements. 
HAMILTONIAN SYSTEM—HAMMER, STEAM-HAMMER.

last of which, published in 1833, he predicted the existence of the two kinds of conical refraction (see REFRACTION), the experimental verification of which by Lloyd still forms one of the most convincing proofs of the truth of the Undulatory Theory of Light. See LITROW. The great feature of his Systems of Rays is the employment of a single function, upon whose differential coefficients (taken on various hypotheses) the whole of any optical phenomena may be reduced to attracting curves. He had to be led by this to his next great work, A General Method in Dynamics, published in the Philosophical Transactions for 1834. Here, again, the whole of any dynamical problem is made to depend upon a single function and its differential coefficients. This paper produced a profound sensation, especially among continental mathematicians. Jacobi of Königsberg took up the purely mathematical part of H.'s method, and considerably improved it. In 1836, a large volume of dynamical part has been richly commented on and elaborated by several French mathematicians, all uniting in their admiration of the genius displayed in the original paper. For these researches, H. was elected a knight of the order of the Golden Spur of St. Petersburg, a rare and coveted distinction. The principle of varying action, which forms the main feature of the memoirs, is hardly capable, at all events in few words, of popular explanation. Among H.'s contemporaries in the field of dynamical research we may mention particularly a very general Theorem in the Separation of Symbols in Finite Differences, and his Examination of Abel's Argument concerning the Impossibility of solving the General Equation of the Fifth Degree.

We may also particularly allude to his memoir on Algebra as the Science of Pure Time, one of the first steps to his grand invention of quaternions. The steps by which he was led to this latter investigation, which will certainly, when better known, give him even a greater reputation than conical refraction or varying action has done, will be more properly treated under QUATERNIONS. On the latter subject, he published in 1833, a large volume of Lectures, which, as the unaided work of a single man in a few years, has perhaps hardly been surpassed. He is understood to be at present engaged in preparing for speedy publication another volume of a more elementary character on the same subject, to contain in addition his more recent improvements and extensions of his calculus.

While yet an undergraduate of Trinity College, Dublin, he was appointed, in 1827, successor to Dr. Brinkley in the chair of Astronomy in the university of Dublin, to which is attached the astronomer-royalship of Ireland. In 1835, he was knighted on his delivering the address as secretary to the British Association for its Dublin meeting. He held for many years the post of president of the Royal Irish Academy, and is a member of most of the great scientific academies of Europe. He holds at present, not in Dublin alone, but in the world of science, a position as merited as it is distinguished.

HAMILTONIAN SYSTEM, a method of teaching languages, so called from the inventor, an English merchant of the name of James Hamilton, born about 1769. Having removed to Hamburg in 1798, he took lessons in German, on the understanding that he was not to be troubled with the grammar of the language. He and his teacher read together a German book of anecdotes, the pupil translating word for word after his teacher; and after twelve lessons, Hamilton found himself—so at least we are told—able to read an easy German book. His attention was thus drawn to the subject of learning foreign languages; and finding himself, after a life of viscidities, in the city of New York, about the year 1815, he wrote a treatise expanding his views, and commenced putting them in practice. He undertook to teach adults in fifteen lessons to translate the Gospel of St. John from French into English, but found, we are told, ten lessons sufficient. After teaching for a time with great success in America, he returned in 1823 to England, and visited the chief cities, everywhere presenting himself to attracting crowds, notwithstanding that his system was denounced by many as quackery. He died in Dublin in 1831.

The Hamiltonian method was only one stage in the reaction—begun as early as the time of Comenius (q. v.)—by which Milton and Locke—against the pedantic method of beginning to teach a foreign or dead language by making the learner commit to memory a complete set of grammar rules before he had acquired sufficient practical acquaintance with the language itself in its concrete form, to give the rules any meaning. Hamilton's method of procedure may be shortly summed up as follows: Supposing the language to be Latin to be learned, Hamilton put into the pupil's hands the Gospel of St John in Latin, with an interlinear version, so literal as to shew the gender as well as the number of nouns, &c., and the mood, person, and tense of verbs, giving also the corresponding idioms, but each word by its literal equivalent in English. A fundamental point with Hamilton was to give the primitive, and not the derivative signification of the word, and to give the same signification to the same word in whatever connection it might stand. When the pupil had by this practice got a considerable knowledge of the vocables and accenture of the language, he was practised in giving the English version back into the Latin. Hamilton undertook in this way to give boys of eleven as much knowledge of Latin in six months as they usually learn at our public schools in six years. One obvious defect of this method is, that no language admits of a word-for-word and uniform translation into another; the method is in this respect misleading. Besides, one great use of learning languages is as a mental discipline, and in this point of view the Hamiltonian system is useless. It may be useful in the case of adults who wish to acquire, with as little labour as possible, a limited power of reading and speaking a language; and in any case, a language once begun to be learned on Hamilton's principles, may be afterwards prosecuted by some better method, thus avoiding the painful initatory stages of the grammatical method. The necessity, however, of having recourse to the crude method of Hamilton, is superseded in the practice of most modern teachers, who contrive to make the practical and grammatical knowledge of a language go hand in hand.

HAMM, a town of Prussia, in the province of Westphalia, is situated on the left bank of the Lippe, 22 miles north-north-west of Arnsberg. It is surrounded by an old wall now converted into a promenade, and by a ditch; contains a castle, gymnasium, and college; and carries on the manufacture of linen extensively. Iron is also produced. H. was formerly one of the Hanse towns. Pop. 6357.

HAMMER—STEAM-HAMMER—a tool used for applying the force of impact, either for the purpose of beating malleable materials into a required form, or for driving nails, wedges, &c. The common hand-hammer consists of an iron head, usually faced with steel, fixed crosswise upon a wooden handle. When one side of the head is thinned out of a wedge form or to a point, this is called the pane of the
HAMMER-BEAM—HAMMER-HEAD.

The hammer is a flat disc which strikes the work. Carpenters' and joiners' hammers have a bent point with a V-shaped notch, which is used as a bent lever for drawing nails, &c. The point is sometimes sharpened so as to form an adze or chisel. A multitude of other modifications in the form of hammers are made to suit different kinds of work. Some of the more important of these are described in other articles of the head, and in the hammer operations, such as FORGING, FILE-CUTTING, GOLDBEATING, &c.

For many purposes, hammers are required of greater weight than a man can wield; and a great variety of power-hammers are used. These, for the most part, are masses of iron raised by steam or other power, and then allowed to fall by their own gravity upon the work. The helve or shaggy hammer, used for compressing the mass of iron drawn from the puddling furnace, and the hammer, used in the manufacture of sheet-steel, are important examples of such hammers. The first is a heavy bar of cast iron about ten feet long, weighing three or four tons and upwards, to which is attached a 'proud,' wrought iron faced with steel, weighing nearly half a ton more. It works upon an axis at the end of the bar furthest from the head, and is raised by cams attached to a heavy wheel set in motion by steam or water power; these cams strike the hammer when the projection extending beyond the head, and thus raise it about 18 or 20 inches at the rate of from 70 to 100 times per minute. The tilt-hammer is similar, but much lighter, and is adapted for striking above 300 blows per minute. In order to obtain a still shorter 'tail,' a downward inclination beyond the axis, and the cams strike this downwards, and thus lift the longer arm of the lever to which the head is attached. The work, when worked by steam, as they usually are in this country, are of course, steam-hammers; but when the term steam-hammer is used without qualification, it applies to another and more elaborate machine of very different construction, invented by Mr James Nasmyth in 1842, and subsequently modified and improved in some of its minor details. In this, the hammer is attached to the bottom of a heavy mass of iron, the 'hammer-block,' capable of rising and falling between upright bars or columns, again, is fixed to the rod of a piston, which works in a cylinder placed perpendicularly over the hammer-block, hammer, and anvil. As the piston rises in the cylinder, it lifts the attached mass, which is then allowed to fall from various heights, according to an adjustment which can be made by an attendant simply touching a handle. The adjustments are so perfect that it may be made to crush a mass of iron, and at the next blow to crack a nut held in the fingers without damaging either kernel or fingers, or to crack the top of an egg in an egg-cup, as might be done with the bowl of a spoon. The mechanism by which this is effected is too elaborate to be described here in detail. One novel contrivance, viz., the 'latch,' which reverses the action of the steam-valves at the precise moment required, is of remarkable ingenuity. In the first 'Nasmyths' that were used, the weight of the descending mass—viz., the hammer-block, hammer, &c.—was from 30 to 60 cwt., and they were justly regarded as mechanical marvels. Steam-hammers with a descending mass of eight tons, with a fall of six or eight feet, have since been constructed. In order to compare the power of these with the 'helve' or other hammers, which descend by angular motion on a pivot, it must be remembered that these latter, when formed of a straight bar, are only effective to the extent of a body of one third of their weight falling directly from a corresponding height, on account of the fact that the whole bar forming the hammer is moving with a velocity varying from nothing at the axis, to a maximum at the end of the bar, where the hammer is forming the fulcrum.

HAMMER-BEAM. A portion of an oven timber roof, forming a truss at the foot of the rafter, which gives strength and elegance to the construction. It looks as if there had been a tie right across, and the centre part being cut out, the remnants at each end form the hammer-beam. The end next the apartment is usually ornamented with shields, heads, pendants, &c.

HAMMER-CLOTH, a cloth which covers the driver's seat in some kinds of gentlemen's carriages. The term is believed to be a corruption of hummock-cloth, the seat which the cloth covers being formed of strips or webbing stretched between two crutches, as a sailor's hammock is suspended. Ease of motion, as in the case of springs, is the cause of this arrangement. Hammer-cloths are usually ornamented with fringes, and bear the arms of the proprietor of the carriage. They are old-fashioned, and now more seldom seen than formerly.

HAMMERFEST, the principal town and trading port of Finnmark (q.v.), in Norway, and the most northern town of Europe, is situated in 70° 40' N. lat., and 23° 30' E. long. Pop. 1125. It is situated in a barren treeless district, on an island of Quaioe ('Whale Island'), and consists of one long street skirtng a wall of rock. The harbour is good, and presents a busy appearance during the summer months of the year. When it is visited by some 200 vessels, which bring hemp, meal, potatoes, and other provisions, in exchange for oil and fish (the staple commodities of the island), reindeer hides, cider, down, and fox-skins. During the two summer months the sun is continually above the horizon, and the heat is very great, yet the winter, singular to say, is mild enough to allow of the fisheries being carried on. Copper from the works at Karlsfjord, which have been in the hands of an English company since 1847, is also sent to England from Hammerfest. It is the northern limit of the birch.

HAMMER-HEAD, or HAMMER-HEADED SHARK (Zygorna or Sphyraena), a genus of fishes of the great family of GHBARS; having the general form and characters of the family; but distinguished from all other fishes by the extraordinary form of the head, which, in the adults, resembles a double-headed hammer, being extended on both sides to a considerable length, and having the eyes at the ends of the lateral extensions. The mouth is below the centre of the head. The hammer-headed form is not nearly so perfect in the young as in the adults. It is supposed to be intended for enlargement of the sphere of vision. In the fetal state, the lateral extensions are doubled upon themselves. The hammer-heads are ovo-viviparous, and produce many (about forty) young at a birth. They are most abundant in tropical seas. In the Bight of Benin, they may often be seen ascending from the clear blue depths of the ocean.
HAMMERSMITH—HAMPDEN.

like a great cloud. They are very voracious. Some of them attain a great size. One species (Z. malleus) has been observed on the British coast. It attains a length of twelve feet or upwards. It chiefly belongs to the warmer parts of the Atlantic Ocean.

HAMMERSMITH, a village of England, in the county of Middlesex, about six miles west-southwest of the London post-office, is situated on the Thames, which is here crossed by an elegant suspension bridge, completed in 1827, at a cost of £80,000. The grounds in the vicinity are occupied as nurseries and market-gardens, from which a large supply of flowers and vegetables is sent to the city. The parish church, a plain brick building with a low tower, was erected in 1631, and consecrated by Land, then Bishop of London. It contains also the convent of the Good Shepherd, and, in connection with it, an asylum for penitent women. Near the Broadway stands the West-London Hospital, supported by voluntary contributions. There is also a large endowed school, founded by a Mr William Godolphin, and which takes his name. The premises and grounds of the school-room cover upwards of four acres. Formerly, a detached village, and connected with London only in a commercial sense, H. is now joined to that city by continuous lines of street, and forms essentially a portion of it. The parish of H. is traversed by six very important railways, two of which terminate here. Pop. of the parish (in 1861) 24,413.

HAMMOCk, the apparatus in which a sailor sleeps his bed, derives its name through the Spanish hamoco, from a Peruvian word, the custom of thus suspending a bed having been derived from Perú, where the natives fasten the two ends of a piece of canvas, or of a netting of grass twist, to the branches of a tree, and lie in it in a luxurious case. A sailor’s hammock consists of a rectangular piece of hempen cloth, about six feet long and three in width, gathered together at each end by means of cords and a clew, and hung to hooks under the deck. The hammock thus suspended forms a sort of bag capable of containing divine and able controversial writer, the youngest son of Dr John Hammond, a physician, was born at Chertsey, Surrey, August 18, 1635. Educated at Eton, he was, in 1618, sent to Magdalen College, Oxford, where he sedulously applied himself to classical studies. In July 1625, he became a Fellow of his college, and in 1629 entered into holy orders. In 1632, he was presented to the rectory of Penshurst, in Kent, and in 1643 he became Archdeacon of Chichester. He followed the unfortunate Charles to the Isle of Wight, and continued with the king as his chaplain till his attendants were dismissed, in 1647; he then returned to Oxford, and was chosen sub-dean of Christchurch. In 1648, he was deprived of his college offices by the parliamentary commissioners, and shortly after retired to Westwood, in Worcestershire, the seat of Sir John Packwood, where the remainder of his life was spent in literary labour. He died April 27, 1660. His celebrated work, the Paraphrase and Annotations on the New Testament, was published in 1653. A new and enlarged edition came out in 1656, but the best edition is that of 1702. His collected works were published, in 4 vols. folio, in 1674—1684. His sermons and minor works are reprinted in the Oxford Library of Anglo-Catholic Theology.

HAMMOON. See Steantan, Lake Of.

HAMPDEN, John, a celebrated English patriot, said to have been born in London in 1594, was the son of William Hampden, of Hampden Busk, Huntingdonshire, and Elizabeth, daughter of Sir Henry Cromwell of Hinchingbrooke, Huntingdonshire, aunt of Oliver Cromwell. His father died in 1597, when he was only three years old. In 1608, he was entered a gentlewoman at Oxford, and in 1613 was admitted to the Inner Temple, where he made considerable progress in the study of law. On January 30, 1621, he first entered the House of Commons as member for the now disfranchised borough of Grantham. He attached himself to the party of St John, Selden, Coke, Pym, and those who opposed the arbitrary encroachments of the crown, but at first took no very forward part in public business, and spoke but seldom. In the first three parliaments of Charles I., he sat for Wemdocer. In 1627, for refusing to pay his proportion of the general loan which the king attempted to raise on his own authority, H. was committed to close imprisonment in the Gatehouse. Subsequently, he was removed to Hampshire, but, with seventy-six others, unconditionally liberated by an order of council. His activity and industry in parliament now rendered him one of its leading and most useful members; he was on most of its committees; but after the dissolution of the parliament of 1628—1629, he retired to his estate, and devoted himself to study and to country sports and occupations. Claiming the power to tax the country in any way he thought proper, in 1634, Charles had recourse to the impost of ship-money. At first limited to London and the maritime towns, and levied only in time of war, it was, in 1636, extended to inland places, in time of peace, when H. absolutely refused to pay it, and his example was followed by nearly the whole county of Buckingham. In 1637, he was prosecuted before the Court of Exchequer for non-payment, when a majority of the judges gave him a verdict, and when H. absolutely refused to pay it, and his example was followed by nearly the whole county of Buckingham. In 1637, he was prosecuted before the Court of Exchequer for non-payment, when a majority of the judges gave him a verdict, and when H. absolutely refused to pay it, and his example was followed by nearly the whole county of Buckingham. To the Long Parliament he was returned for Wemdocer, for Huntingdon, for Huntingdon, and made his election for the latter. For his resistance to the king’s proceedings, he was
HAMPSHIRE—HAMPTON COURT CONFERENCE.

It was formerly famous for its medicinal springs, and is still a favourite place of residence and holiday resort among Londoners, who are attracted to it by the beauty of its situation and the purity of its air. The situation is in the district known as the Heath, above the village, is the Heath, which offers extensive and pleasant prospects of the surrounding country. On the Hampstead road, and in the vicinity of the village, many handsome villas have been erected. Pop. (1861) 10,104. A house on the Heath, formerly called the Upper Flask Inn, and now a private residence, was at one time the place of resort of the famous Kit-Kat Club, at which Steele, Addison, Richardson, and others used to assemble. The village of H. was much frequented by Pope, Gay, Johnson, and Akenside, and later by Byron, Leigh Hunt, and Johanna Baillie.

HAMPTON, a small village on the Chesapeake Bay, in Virginia, United States, America, giving its name to the Chesapeake and Ohio Canal, and also to the town and county of Hampton, Virginia.

HA' MP T O N, a village of England, in the county of Middlesex, and on the north side of the Thames, about twelve miles south-west of London. The streets are narrow, and the houses irregularly built; in the vicinity, however, there are many noble mansions and beautiful villas. Pop. (1861) 5,000.

HAMPTON COURT PALACE, long a royal residence, and now usually occupied by persons of rank, reduced in circumstances, stands about a mile from the village in the midst of grounds that extend to the Thames. The original palace was erected by Cardinal Wolsey, and came afterwards into the possession of Henry VIII., who enlarged it, and formed around it a royal park or chase, which he stocked with deer. Here Edward VI. was born and here his mother, Queen Jane Seymour, died. Charles I. underwent a portion of his confinement at this palace, and it was the occasional residence of Cromwell, Charles II., and James II. A consider- able portion of it is still inhabited by the royal family. Among other attractions of the grounds is a maze or labyrinth, which furnishes much amusement to youthful visitors.

HAMPTON COURT CONFERENCE, a conference which took place at Hampton Court, shortly after the accession of James I. to the throne of England, to settle the settlement of ecclesiastical affairs. The king presided and took a principal part in the conference. He was attended by some of the nobility and highest officers of state, but no one seems to have been permitted to take any part in the proceedings except the king himself and the bishops whom he had summoned. Of these, the

one of the five members whom Charles, on January 4, 1642, rashly attempted in person to seize in the House of Commons; and on the breaking out of the civil war, he raised and became colonel of a regiment in the parliament army under the Earl of Essex. He was also a member of the Committee of Public Safety, and in the prosecution of the war, constantly advised prompt and energetic measures. He was present at the repulse of the royalists at Southam, at their defeat near Aylesbury, at the fight at Edgehill, and at the assault and capture of Reading. Prince Rupert having attacked a parliamentary force at Chimbor, near Thame, H. put himself at the head of a few cavalry that were roused in haste to oppose him, and in the fight that ensued at Chalgrove Field, received in the first charge a wound, of which he died six days after, on June 24, 1643. He was twice married, and by his first wife had three sons and six daughters.

HAMPSHIRE, SOUTHAMPTON, or familiarly, HANTS, a maritime county in the south of England, is bounded on the W. by Dorset and Wilts, on the N. by Berks, on the E. by Surrey and Sussex, and on the S. by the English Channel. The county is divided into the Suburbs of London, and an area of 1,070,216 acres, 900,000 of which are estimated to be under culture. Its population in 1851 was 495,370; and in 1861, 481,495. The surface is irregular, being traversed by the North and South Downs, the western portion of the county, almost wholly detached from the main portion by the Southampton Water, is occupied mainly by the New Forest. This tract is 64,000 acres in extent, is the property of the crown, and is valuable for the oak timber, which is the only timber that can be used for the British navy. Within the forest, an aboriginal breed of pony is still found. Besides that called the New Forest, there are also remains of those of Bevo, Alice Holt, Woolmer, &c. The principal rivers are the Anton or the Test, and the Itchen, which flow southward through the country into the Southampton Water, and the Avon, also flowing southward, and forming the western boundary of the New Forest. The climate of the county is in general mild, and favourable to vegetation; indeed, the climate in the south of the Isle of Wight is supposed to be milder than that of any other portion of Great Britain. The soil consists in part of peaty, and in part of gravel, and is formed of stiff clay and chalk. All the usual crops are produced, hops are cultivated, and the bacon cured here is famous. The manufactures of the county are inconsiderable. Southampton and Portsmouth, both termini of important railways, are the chief centres of trade. The county, exclusive of the boroughs and the Isle of Wight, sends four members to the House of Commons. The New Forest seems to have been fatal to the family of William the Conqueror; there were two of his sons, and his grand-son, met with sudden and violent deaths. Of the early ages of English history, H. contains many interesting relics: of these the chief are the Ports of Winchester, at the head of the River Test, and of Portsea, or Old Portsmouth; Calshot Castle, and Hurst Castle, now occupied as coast-guard stations, erected in the time of Henry VIII., and Netley and Beaulieu Abbeys, and the Priory of St. Dionysius, all in the neighbourhood of Southampton. The old town of Southampton contains numerous remains as coins, urns, pottery, &c. For further information on the antiquities and history of the towns of H., see articles WIGHT, ISLE OF; SICILY; WINCHESTER, &c.

HAMPSFIEAD, a village of England, in the county of Middlesex, is finely situated on a range of hills, four miles north-north-west of London.
Hamster—Hand.

Representatives of the Episcopalian party were more numerous than the Puritans; and the Puritans, although men of known worth and learning, were among the least extreme of their party. Archbishop Whitgift, with eight bishops, six deans, and an archdeacon, appeared as the object of their unceasing hostility; two Oxford professors of divinity, two divines from Cambridge, and along with them Mr Patrick Gallo-

Hamster (Oriectus vulgaris).

The animal carries thither in its cheek-pouches, and on which it feeds during the milder parts of winter, spending the most severe part of that season in a state of torpid hibernation. It is a great pest to the farmers of the countries in which it abounds, and is very prolific, producing two or three broods in the year, and sixteen or eighteen at a birth. It feeds generally on vegetable food, as leaves, seeds, &c., although it is said to sometimes prey on small quadrupeds, birds, lizards, frogs, &c. The H. carries away pease and other legumes in pod, but shells them, and deposits only the edible portion in its store. Its labours and depredations are all carried on by night. It is an extremely fierce and pugna-

Hamster (Oriectus vulgaris).
four hands are adapted to the variety of actions which the human hand is capable of performing, and they are all, to some degree, required for support and locomotion; so that while in the higher forms of the quadrupedæ the extremities present an approximation in structure to those of man, in the lower they gradually tend to resemble the ordinary quadrupedal type. That," says Cuvier, "which constitutes the hand, properly so called, is the faculty of opposing the thumb to the other fingers, so as to seize upon the most minute objects—a faculty which is carried to its highest degree of perfection in man, in whom the whole anterior extremity is free, and can be employed in prehension. The peculiar prehensile power of the human hand is chiefly dependent upon the length, power, and mobility of the thumb, which can be brought into exact opposition to the extremities of all the fingers, whether separately or grouped together.

Before describing the hand itself, we must say a few words on the upper extremity generally, of which the hand may be regarded as the essential part.

The general arrangement of the bones of the arm will be readily understood by a glance to fig. 1. The general plan of the osseous framework of the upper and lower limb is very similar. The humerus or arm-bone corresponds to the femur or thigh-bone; the lower end of the humerus is connected with the two bones of the forearm, the radius and the ulna, which correspond with the two bones of the leg. Then come the carpals, bones, the metacarpals, and the phalanges, just as we have tarsal bones, metatarsal bones, and phalanges in the foot.

In fig. 2 (which we copy from Humphry's Human Foot and Human Hand) we have a diagram shewing the way in which the bones of the hand are arranged. The carpals (3 to 10 in the figure) are eight in number, and are arranged in the wrist in two rows. The first or upper row consists practically of three bones (3, 4, 5), the fourth (6) being regarded as belonging to the class of Sesamoid Bones (q.v.), and the second row of four bones (7, 8, 9, 10); so that, excluding the pisiform bone (6), the carpal and the tarsal bones correspond in number. As we commonly term the palm the front of the hand, the thumb becomes conventionally the outer, and the little-finger the inner digit; but according to the rules of comparative anatomy, and in order to compare the hand and foot, we ought to reverse these terms. The outer (3) of the carpal bones of the first row is united with the inner (4) of the row, the bones of the thumb and forefinger (1 and 2), and constitutes with them the outer division of the hand. The inner (5) of the carpal bones bears the little, and the next (the ring) finger (V and IV), and constitutes with them the inner division of the hand, while the middle one (4) bears the middle-finger (III), and belongs to the middle division of the hand. We likewise see from this figure, and likewise from fig. 1, that the two outer bones (3 and 4) are connected with the radius, while the inner bone (5) is connected (indirectly by a thick ligament) with the ulna.

It is unnecessary for us to enter into any anatomy of the separate bones of the fingers, or describing the muscles, tendons, nerves, etc., etc. For these we refer to standard works. The hand is a very complicated organ, and the arrangement of its parts is subject to many modifications, depending upon the requirements of the various species of animals, so that in many cases it is difficult to determine for certain whether an organ is adapted for the use of the thumb or the fingers. It is sufficient for us to bear in mind that in the great majority of cases the hand is by far the most serviceable organ for seizing, catching, and holding objects, and is second to none of the organs of the body for the purposes of locomotion, grasping, and grasping objects. The human hand is, indeed, a masterpiece of the artist, and the hand of man is the most remarkable organ of the body.
motion in one plane. We have next to consider a class of movements of the forearm and hand, to which there is nothing analogous (at least to any material extent) in the leg. The movements in question are called 'pronation and supination.' In pronation (derived from pro, to push forward, with the face downwards), we turn the palm of the hand downwards, as in picking up any substance from the table; in supination (derived from supinus, with the face upwards), we turn the palm upwards, as for the purpose of receiving anything that may be placed in it.

These movements of pronation and supination are so important to the usefulness of the hand, that we must notice the three muscles by which they are chiefly affected. One of the three muscles (A, fig. 3) passes from a projecting process on the inner side of the arm-bone, at its lower end, to the outer edge of the middle of the radius. Its contraction causes the radius to roll over, or in front of, the ulna. It thus pronates the hand, and is called a pronator muscle. Another muscle (B, fig. 4) passes from a projecting process on the outer side of the arm-bone to the inner edge of the radius near its upper part. It runs therefore in an opposite direction to the former muscle, and produces an opposite effect, rolling the radius and the hand back into the position of supination. Hence it is called a supinator muscle. The third is a very powerful muscle, termed the Biceps (q.v.), which not only bends the elbow, but from the mode in which its tendon is inserted into the inner side of the radius (see fig. 5), 'also rotates the radius so as to supinate the hand; and it gives great power to that movement. When we turn a screw, or drive a gimlet, or draw a cork, we always employ the supinating movement of the hand for the purpose; and all screws, gimlets, and implements of the like kind are made to turn in a manner suited to that movement of the right hand; because mechanicians have observed that we have more power to supinate the hand than to pronate it.' Supination can only be performed to its full extent by man, and even in man it is not the natural or habitual position; monkeys can partially effect the movement, and in most of the lower animals the part corresponding anatomically to the hand is constantly in a state of pronation.

The movements of which the hand itself, without reference to the arm, are capable, are very numerous, and in this respect differ considerably from the corresponding movements of the foot. Thus we can bend the fingers down upon the palm, or we can extend them beyond the straight line; we can separate them from one another to a considerable extent, and we can close them with considerable force. The wrist and hand are bent forwards or flexed upon the forearm by three muscles which pass downwards from the inner condyle or expanded end of the humerus, and are termed the radial flexor, the ulnar flexor, and the long palmar muscles. The first two of these muscles are inserted into wrist-bones on the radial and ulnar sides respectively, while the third expands into a fan-like fascia or membrane in the palm of the hand, and thus serves both to support the skin of the palm and to protect the nerves and vessels which lie below it. Beneath the palmar fascia lie two sets of flexor muscles of the fingers, and they present so beautiful a mechanical arrangement as to merit special notice.

The superficial or perforated flexor muscle passes down the front of the forearm and divides into four tendons, which become apparent after the removal of the palmar fascia, and are inserted into the second phalanges of the fingers, each tendon splitting at its termination, to give passage to the similar tendons of the deep or perforating flexor muscle, which passes from the upper part of the ulna to be inserted into the last phalanx of each finger. This arrangement of the tendons of the superficial and deep flexor muscles is shown in fig. 6. These flexor muscles are antagonised by the common extensor muscle of the fingers, which, like the flexors, divides into four tendons, one for each finger. Besides these, there is a special extensor of the index-finger, a series of muscles forming the ball of the thumb, which move that organ in almost every direction, and various small slips giving lateral and other movements to the fingers.

It is sufficient to observe that the hand is very richly supplied with blood-vessels and nerves, without entering into any anatomical details on these
There is no part of the body where the sense of touch is so acute as at the tips of the fingers; but we shall defer to the article Touch, Organs and Sense of the consideration of the special arrangements which make this part of the hand peculiarly important in relation to our knowledge of external objects.

Our notice of the comparative anatomy of the Foot (q.v.) renders it unnecessary to trace the modifications presented in the lower animals by the bones corresponding to those of the human hand; as the carpal and metacarpal bones in all the phalanx undergo adaptations of form to meet the individual wants of the animal, very much in the same manner as the tarsal and metatarsal bones and their phalanges. Thus, the reader will readily see that the so-called knee of the horse, for example, is the carpus, and he will have no difficulty in tracing the metacarpal bones and phalanges. See the articles Broken Knees and Horse, and Humphry, On the Human Foot and Human Hand.

Handel, George Frederick, one of the greatest of English composers and musicians, though a native of Germany, spent so large a portion of his life in England, where he composed his greatest works, that Britain may almost claim him as her own. He was born at Halle, Upper Saxony, February 24, 1684. He manifested in infancy an extraordinary passion for music, and at the age of seven, having accompanied his father on a visit to the Duke of Saxe-Weissenfels, he found his way to the Duke's palace, and he was heard by a duke, who remunerated with his father against further opposition a genius of so decided a character. He was now placed under a music-teacher, Zachau, where he remained until he was 13, composing every week cantatas for the church-service, and learning all the instruments, especially the organ. In 1698, he was sent to Berlin, where the Elector of Brandenburg was so impressed with his talents, that he wished to send him to Italy. As his father would not accept this offer, he returned to Halle, whence, on the death of his father, he went to Hamburg in 1703. Here he played a violin in the orchestra of the opera. He was soon its director, and composed his first opera, Amira, which was rapidly followed by Nero, Florinda, and Dafne. His violent temper involved him in a quarrel with a brother-composer, which resulted in a duel; the sword of his adversary was stopped by a button or a music score. He next visited Italy. In Florence, he composed Rodrigo, 1709. His Agrippina, composed in Venice, had a run of thirty nights. At Rome, he was received at Cardinal Ottoboni's, where he heard Corelli, and beat him with his own violin for not playing to suit him in his Il Triunfo del Tempo. At Naples, he composed Acis and Galatea, and in 1710 returned to Germany, where he was appointed chapel-master to the Elector of Hanover, afterwards George I. He afterwards went to England, where he was patronised by Queen Anne and the nobility.

He composed Rinaldo, Pastor Fido, Thésée, and in 1715, Amadis da Gaua, in which Nicollini and Valentini first sang in England. The opera was an exotic in England, and a plant of slow growth. A Royal Academy of Music was formed, and after some competition, was placed under H.'s management; but his overbearing temper could not cope with musical jealousies. An opposition house was started, and both soon failed, with a loss to H. of £10,000. He now commenced the composition of his oratorios. Esther was produced in 1733; it was followed by Deborah, Alexander's Feast, and Israel in Egypt; and in 1740 appeared L'Allegro and il Penseroso. These were produced in the Lincoln's Inn Fields Theatre, but with no profit. Even the Messiah, the most sublime of his compositions, which at this day draws tens of thousands, was at first a failure. Tired of this titanic struggle, H. went to Dublin, where he remained nine months, and received a generous support. On his return to London, he composed his Samson, and produced his Messiah for the benefit of the Foundling Hospital. It was repeated nightly, with the hope of impressing on the public that Messiah was produced on the 4th of April, and he died as he wished, on Good Friday, the 13th of April 1759, 'in hopes,' he said, 'of meeting my good God, his sweet Lord and Saviour, on the day of his resurrection.' Among his works, which are in the Queen's Library, are 59 operas—8 German, 26 Italian, 16 English; 29 oratorios, a great quantity of church-music, cantatas, songs, and instrumental pieces. He was a wonderful musician, and his compositions are often said to be of a grandeur and sublime power that are seldom performed, but his oratorios hold the same place in music that in the English drama is accorded to the plays of Shakespeare; and the Handel Festivals, lasting several days, in which they are performed by thousands of enthusiastic musicians, are the grandest musical exhibitions of our times.

Hand-fasting, the ancient term for betrothment, now disused.

Hand-glasses are very useful implements of gardening, for the protection of tender plants. They are also held by some of them in their belt of glass, with a knob at top, for convenience of lifting them, chiefly used for covering cuttings in the greenhouse or stove, until they strike or send forth roots; whilst others consist of metal frames—zinc, lead, iron, or copper—filled up with panes of glass, and sometimes of a size large enough to be used for covering tree-pancions, acacias, and other tender shrubs.

Hand-tree (Chersothenon platanoide), a large tree of the natural order Sereulaceae, which receives its name from the peculiar appearance of its flowers. These have no corolla, but a large 5-lobed and angular coloured calyx—bright red within—from which project the five stamens, united by their filamentous filaments; it is an object of superstitious veneration to the Mexicans; a single tree near Toluca, which is mentioned in the earliest histories, being asserted by them to be the only one in the world, and their eager gathering of its flowers always preventing its multiplication by seed.
HANDS.—HANG-CHOW-FOO.

1854, and it can only be done now in civil cases. In Scotland, a jury are not yet allowed to judge of the handwriting in this way in any cases. In some countries—as, for example, in Scotland—a will, if written in the testator's handwriting, is admitted to be genuine without the attestation of witnesses, being then called a Holograph (q.v.) instrument; but there is no such privilege in England, Ireland, as all wills, by whomever written, must be attested by witnesses.

HANG-CHOW-FOO, the capital of the province of Che-keang, in China, on the left bank of the Tien-tang, where that river disembogues into the Bay of Hang-chow-foo, is situated at the commencement of the Grand Canal, in lat. 30° 15' N., long. 129° 15' E. It is about 150 miles south-east of Nankin. H. is the most magnificent city of China—a Chinese proverb makes it a heaven upon earth. It was the capital of the empire during the rule of the Mongols, when it was visited by the celebrated Marco Polo early in the 14th century. There are ten gates through its lofty walls, which are 20 miles in circumference, but there are many inhabitants without the encinte than within. The population is estimated by Dr Macgowan at 800,000. The streets, which are of greater width than is usual in Chinese cities, are well paved, and in some directions lined with elegant and extensive warehouses. The terminal ramifications of the Grand Canal are spanned by countless elegant bridges. H. is celebrated for its silk manufactories, and its embroidery, and for the beauty of any part of China. Mulberry-trees occupy every vacant spot within and without the walls. No city in China, unless it be that of Suchau, possesses wealth to compare with that of this remarkable place, in which, moreover, is the most literate and most religious part of the empire. Colleges and temples, literati and priests, abound and flourish in Hang-chow-foo. The imperial library in the palace of Kienlung, and the literary institutions, appear, however, to be going to decay, and could not, any period have had much educational influence. One cause of the celebrity of the city is found in the beauty of its environs. The tower of the Thundering Winds, although in ruins, is still an imposing edifice, while underneath it are light airy bridges, and temples of the size of villages, render the natural beauties of the city highly picturesque. One of the temples possesses 900 images of Buddha, in three distinct sizes, of the size of life, richly covered with gold. Nothing can exceed the beauty of the valleys opening into the lake, richly adorned as they are with trees, chiefly the camphor and tallow trees, and the arbor vitae. From a remote period, these scenes have been the resort of pilgrims, and every spot is hallowed by some legendary incident. At one place there is an image of Buddha, cut out of the solid rock, measuring 48 feet from shoulder to shoulder. The nose is seven feet long, and the other parts are of a proportional size; it is girt over like wooden and clay images of the same personage. The protruding rocks are profusely carved with religious inscriptions and images of mythological characters. The northernmost section of the city is known as the Tartar city, being exclusively devoted to the Manchu garrison or military colony. It is separated from the Chinese city by a low wall. About 25 miles below the city is Luhan, once a mart of considerable importance, the port of H., when that city was the metropolis of China, described by Marco Polo as an extremely flourishing place; fluvial changes have rendered it inaccessible to any but flat-bottomed vessels. Luhan is now the port of H., situated on the north side
HANGED, DRAWN, AND QUARTERED—HANGING GARDENS.

The bay, about 50 miles from the capital. Chapoo has also a Tartar city; it communicates by branches of the Grand Canal with H. and Shanghai. It is the port to which Chinese trade with Japan is restricted.

The configuration of the Bay of Hang-chow-foo and the embouchure of the Tien-tang river, which empties into it near the provincial capital, favours the development of the tidal phenomenon designated an eagr or bore. See Bore. Dr Macgowan, the first European who has witnessed this magnificent spectacle, has published an account of it in the Proceedings of the Asiatic Society of Hong-kong. As the tide rushes into the mouth of the river, it becomes elevated to a lofty wave, which attains its greatest magnitude opposite the city of Hang-chow-foo. Generally, there is nothing remarkable in its aspect, except at the period of the vernal and autumnal equinoxes, the maximum being at the latter season. As the hour of flood-tide approaches, crowds gather in the streets running at right angles with the river, but at safe distances; boatmen stop lading and unloading their vessels, and put out into the middle of the river. The centre of the advancing wave, its noise, compared by native poets to that of thunder, speedily drowns that of the boatmen; and as it advances with prodigious velocity, it assumes the appearance of an alabaster wall, or rather of an advancing cataract or torrent, five miles across and about 30 feet high. As the foaming wall of water dashes impetuously onward, one trembles for the safety of the floating multitude. They cease shouting, and devote their energies to the steering of the provisions of human life. The centre of the advancing wave, which threatens to submerge everything aloft; but they all vault as it were to the summit with perfect safety. This grand and exciting season is but of a moment's duration; the wave passes up the river in an instant, but from this point with gradually decreasing force, volume, and velocity, disappearing entirely a few miles above the city. From ebb to flood tide, the change is almost instantaneous; of a slight flood continues after the passage of the wave, but it soon begins to ebb. Within the historic period, numerous changes have been effected by the action of this wave, the most noted being the removal of a rocky islet from the centre of the river, opposite Hang-chow-foo. Chinese ingenuity has been long exorted, with imperfect success, in preserving the alluvial plain from the wasting action of the eagr. The history of the dykes that have been successively erected, of failures and disasters, found in the local annals, shew that, like the Yellow River, this part of the Tien-tang has been a constant source of anxiety and expense to the government, costing about 150,000 dollars per annum.

HANGED, DRAWN, AND QUARTERED, the description of the capital sentence on a traitor, which consisted of drawing him on a hurdle to the place of execution, and after hanging him, dividing the body into quarters. This punishment was substituted by the stat. 54 Geo. III. c. 146, for the ancient more barbarous sentence of dismembering alive, but the crown has power to reduce the sentence to simple beheading. See also HANGING.

HANGING is the mode by which capital punishment is carried out in the United Kingdom. In England, formerly, in atrocious cases, it was usual for the court to direct a murderer to be hung upon a gibbet in chains near the place where the crime was committed—also at a later period to order the body to be dissected—and the execution to take place on the next day but one after the sentence was published. But these inceess severities were abolished by the stat. 6 and 7 Will. IV. c. 30.

The mode of punishing by hanging was first adopted in England in 1241, when Maurice, a nobleman's son, was hanged for piracy. Other more notorious cases of the same kind occurred with great frequency, being prescribed by statute, but have been abolished, and hanging has long been the ordinary, because the most humane, mode of executing capital punishment. In treason, hanging is part of the statutory punishment, it is equally with mangling, the body, though the crown may change the sentence into simple beheading, except in the case of women, who are only hanged, in deference to their sex. Formerly, in Scotland, on the other hand, a capital sentence pronounced south of the Firth could not be executed within less than 30 days; and if pronounced north of the Firth, within less than 40 days after it was pronounced. But now, in both cases, the day of execution must not be fixed sooner than 30 days after the sentence of Firth; nor less than 20, nor more than 27 days, if north of the Firth, after sentence passed. In all cases, the hanging or execution takes place in the open air.

The cause of death in hanging is complex. The compression of the windpipe by the cord, the obstruction of the return of venous blood from the head, and of the flow of arterial blood to the brain, the stretching or tearing of the nerves, structures of the neck, and in some instances dislocation or fracture of the vertebrea, may occur in the production of the fatal effect, which, though attended with violent struggles in some cases, is probably more peaceful in others. The subject, in its relations to medical jurisprudence, will be more fully considered under the title STRANGULATION.

HANGING GARDENS. The Hanging Gardens of Babylon were a seat of the wonders of the world. Their construction is variously ascribed to Queen Semiramis, and to Nebuchadnezzar—seven centuries later, but still more than five centuries A.D.—who is said to have been greatly gratified by his construction of his Babylonian residence, Anytus, because the Babylonian plain seemed dry to her in comparison with the varied and romantic scenery of her native land. Diodorus and Strabo have given particular descriptions of them; and although it is remarkable that the city was adorned by Hercules, whilst Quintus Curtius speaks of them as "fabulous wonders of the Greeks"—an opinion which some of the learned in modern times have adopted, denying their very existence—the probability seems to be in favour of the general accuracy of the descriptions, and even that the ruins of this celebrated structure are to be recognised among the mounds which mark the site of Babylon. See BABYLON. The Hanging Gardens are said to have formed a square, with an area of nearly 40 acres; but rising in terraces curiously constructed with stone pillars, across which were placed stones, covered with reeds and bitumen, and again with bricks, wholly cemented, above the ends of lead, to prevent moisture from flowing down, and finally a sufficient layer of earth; the summit being elevated three hundred feet above the base, so that at a distance the whole presented the appearance of a pyramidal wooded hill. There was a large reservoir at the summit, which was filled with water by pumping from the Euphrates, for the irrigation of the gardens, and the supply of their numerous fountains. Fountains and founteins
rooms were distributed throughout the numerous terraces; groves and avenues of trees, as well as paterns of flowers, diversified the scene; whilst the view of the city and neighbourhood was extending magnificently.

HANKOW, in lat. about 30° 30' N., and long. 114° E., the newly opened port of China, situated in the heart of the empire, at the junction of the Han river with the Yang-tze-kiang, 550 English miles from its mouth. It consists of an agglomeration of cities and towns, the principal being Wuchow on one side of the Han river, and Han-yang-foo on the opposite side. Strictly speaking, H. is a suburb of the former. Prior to its destruction during the existing civil war, it presented an assemblage of houses and vessels, rendering it second in this respect only to London and Yedo; it is, however, rapidly rising from its ashes, and promises to become the most important mart in the empire for foreign commerce. English and American steamers stem the current of the great river, plying regularly and frequently between H. and Shanghai. Vessels of large size can reach the city; the river is navigable 360 miles higher up, to the city of Ichang. Powerful flat-bottomed steamers are requisite for this part of the Yang-tze-kiang, the current running at from seven to eight knots per hour. Tea and silk have already been exported in large quantities from this port, and a foreign settlement is springing up here as the ports on the coast.

HANNIBAL (the gift of Boal) was a common name among the Carthaginians, the list of those famed in history extending to fourteen or fifteen. But the greatest of all the Hannibals was the famous son of Hamilcar Barca. He was born in 247 B.C. When he was nine years old, he accompanied his father on his Spanish expedition; and before starting, swore that oath of eternal hatred to the Roman name, which he kept so faithfully throughout his whole life. After the death of Hamilcar, he was employed by Hasdrubal, his brother-in-law, in most of the military operations which he undertook. Such was the esteem in which he was held by the soldiers, and such a reputation for bravery and strategic skill had he gained, that when Hannibal was ten, the infant Fabius was sent for to elect him commander-in-chief, an appointment which the authorities at Carthage at once ratified. H., at this time in his 22nd year, undertook the command with ready zeal, for he longed to realise the legacy left him by his father, and to strike a death-blow at his country’s rival by attacking her on her own soil. But before he entered on a task of such magnitude, he deemed it prudent to complete the subjugation of Spain, and accordingly spent two years in contests with some tribes lithereto independent of Carthage. Saguntum, a city in alliance with Rome, was attacked by him on the ground that its inhabitants were making aggressions on the Torbelenos, subjects of the Carthaginians. After a siege of eight months, the city was taken; and the Romans, after an embassy had unsuccessfully demanded the surrender of the general who had thus wantonly violated the treaty, declared war in 218 B.C. Having taken Saguntum, H. proceeded to Africa with a force of 85,000 men. But no general engagement took place, the consuls endeavouring to lead H. into mazes, which he succeeded in doing; but the wily African extricated his army by a stratagem, and returned to the south of Italy, where his brother Hamilcar wintered. He crossed at Cannea, and in 217, or, according to others, in August (23) of 216 B.C., almost annihilated a Roman army of 90,000 men under Terentius Varro and Hamilus Paulus. In the battle, which was fought a little below the town. About 50,000 are said to have fallen, including Hamilus Paulus, and a host of Roman knights, senators, and other distinguished persons. Here H. committed, perhaps, the greatest military error of his life, in not marching direct to Rome; but it is supposed that he refrained, in order to allow the tribes of Italy to declare in his favour. Many in the south of Italy did attach themselves to his interests, but not in such numbers as he had anticipated. After this defeat, Hannibal retired into Sicily (Naples), which he did not succeed in taking, but the gates of Capua were opened to him, and here he wintered. The enervating effect which the luxury of Capua is said to have had on his army has been greatly overdrawn, but his residence there forms, in one point of view, the turning-point in the war, which from this time became more of a desultory kind. H.’s great purpose was to arm the Italian nations against Rome, and so to crush her power by
of her own subjects; the Romans, on the contrary, henceforth avoided coming to a pitched battle with the Carthaginians, but sought rather to keep the tribes in awe, and harass H. and his lieutenants by small armies in different parts of the country. H. traversed Italy in all directions, surprised the Roman generals, defeated their armies, captured their towns, such as Casalium, Arpi, Tarentum, Locri, and many others; he defeated Cæcina near Capua; C. Fulvius at Herdonia; Fulvius Flaccus on the Anio; Cisquins and Marcellus in Lucania; and the besieging army before Locri: in all these cases the armies were almost annihilated. The defeat of Hasdrubal, his brother, at the river Metaurus, and the loss of his army, compelled H. to confine himself to the mountainous peninsula of Bruttium, where for four years he resisted all the efforts of the Romans to dislodge him. At length, after having maintained himself in Italy for upwards of fifteen years, he was recalled to Africa, to defend his country against Scipio; but notwithstanding his utmost exertions, and the bravery of his veteran troops, he was defeated by Scipio at Zama, with a loss of 20,000 men. Peace was concluded in the following year (210 B. C.).

H.’s daring scheme had in the meantime been bailed, but his hatred to Rome was not diminished, and as he could not set himself aside all his zeal to make preparations for a still more deadly struggle at some future day. He turned his attention, in the first place, to political reforms, and some constitutional changes which were loudly called for, by which he placed the finances on a better footing. But his enemies accused him to the Romans of stirring up Antiochus III. of Syria to make war on them; and when ambassadors came to Carthage, H. fled to the court of Antiochus at Ephesus. In the war which followed, he placed his troops in a conspicuous part, but the king bitterly regretted afterwards that he did not take the advice of H. to carry the war into Italy. When peace was concluded, the surrender of H. was one of the conditions; but foreseeing such a result, he fled to Etna, king of Elymus, for whom he gained a naval victory over Énumenes, king of Phœnicus. He was at length demanded by the Romans; and seeing no hope of escape, he took poison, which he always carried with him for such an emergency.

Among ancient authorities, the reader may consult, with great profit, Polybios, Dion Cassius, Plutarch, and Appian; and of modern historians, Arrius, Rost, and Rosier. vol. iii. (Heubach’s Lectures on Roman History, vol. i. Mommus’s Hist. of Rome, vol. ii. (Dickson’s translation). For military operations specially, see Vandecourt, Histoire des Compagnies d’Amiral en Italie.

HANNIBAL—HANOVER.

HANNIBAL, a city in Missouri, United States, America, on the west bank of the Mississippi, 132 miles above St. Louis. It is the east terminus of the Hannibal and St Joseph Railway, and has steam-boat communication with other towns on the Mississippi. It has a large trade in pork, tobacco, hemp, and grain, with mills, foundries, and machine-shops.

HANNO (perhaps the father or the son of that Hannover who fell at Himera in 480 B.C.) is famed for a voyage of discovery which he made along the west coast of Africa, to found Libyo-pheenician towns. His expedition is said to have consisted of 61 ships and 30,000 men and women. One city was built not far from the Strait of Gibraltar, and others along the coast reaching to Cape Bojador. He went south as far probably as Sierra Leone. On his return to Carthage, he inscribed an account of his voyage on a tablet, and placed it in the temple of Kronos (Saturn), or, according to others, of Juno. It seems to have been written in the Punic language; the version of it which remains is only a Greek translation. The Periplus has been published on the coast of Latium by Gellein, Bochler, and Muller, and Berkel, and with an English translation by Falconer (Lond. 1797). Great discussions have taken place among the learned as to the time when H.’s voyage took place. Some have placed it in the period of about 570 B.C.; as to the Hannus of all the many Hannos of history; and as to the facts stated in the Periplus; but on these we cannot enter. Some recent writers find evidence in it of the existence of the gorilla in those ancient days. For a full discussion of the subject, consult Dollwell’s Dissertation (in Hudson’s Geographia Minor); Bougainville’s Essay (Mem. de l’Acad. des Inscrip. xxvi. p. 10, and xxviii. p. 280); also Falconer, in his edition already referred to.

HANOVER, a village in New Hampshire, United States, America, pleasantly situated on the east bank of the Connecticut river, 52 miles north-west from Concord. It is the seat of Dartmouth College, founded by Lord Dartmouth for the education of the Indian youth, and a medical college. Pop. 2300.

HANOVER, a kingdom of Northern Germany, which, although it extends from 51° 18' to 53° 52' N. lat., and from 6° 43' to 11° 35' E. long., comprises only portions of the superficial area enclosed within those limits, as some of its territories favouring or wholly or in great part surrounded by those of other states. H. may be divided into three distinct districts, viz.—I. The eastern, which consists of the duchy of Bremen cum Hadeln, a section of the duchy of Holstein, the duchy of Merania, the principalities of Lüneburg, Kaleburg, and Hildesheim, and the countships of Hoya and Darschof; 2. The western (separated from the former by the duchy of Aldenburg) comprises the duchy of Aremberg-Meppen, the principalities of Osnabrück and East Fredland with the Harlingerlands, the lower countships of Lingen and Bentheimer, and the circle of Emshörn, which formerly belonged to the see of Munster; 3. The southern, which is separated from the other Hanoverian territories by Brunswick, and comprises the principalities of Grubenhagen and Göttingen, together with the districts of Ellingen and Hichbi. H. is bounded N. by the German Ocean and the east by Ems, Bremen, and the Hanoverian Saxony, S. chiefly by Westphalia and Hassa Cassel, and W. by the Holland. The following table shows the divisions, or lordsteiten, of H., with their respective areas and populations:

Giving a population of 1,844,976 for the entire kingdom, with a superficial area of 14,67470 square miles.

 Physical Character, &c.—The general physical character of H. is that of an extended plain with slight undulations, but in the south the country is mountainous, embracing a considerable part of the Harz, together with the lesser heights of
HANOVER.

the Eichsfeld, Sollingen, Stützel, Deister-Oster, and Hildesheimer-Wald. From the base of these hills to the sea-coast, the land is one vast plain, only interrupted at certain points by low ranges of hilly ground. The mountains, which abound in minerals, are covered with dense woods, and the valleys lying between them are fertile and well adapted to agriculture; but beyond these valleys the country is traversed from east to west by a sandy tract from 50 to 80 miles in width, known as the Linde, where the inhabitants with difficulty gain a scanty subsistence by rearing sheep and keeping bees. Great marshes or peat-moors cover the north and north-west districts, but these have in some parts been so successfully drained that they yield good pasture, although the soil generally is unproductive, comprising some of the poorest districts of Germany. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dykes, the land being in many parts below the ordinary level of the sea. Along the banks of the rivers there are fertile districts, even in the north of the country.

The principal rivers are, the Elbe, which forms 120 miles of the north-east boundary-line; the Weser, on whose affluent the Leine, the capital of H., is situated; the Aller, the Esta, and the Vechte, which all fall into the German Ocean. There are numerous small lakes in Hanover. The principal canals are those between Lingen and Meppen, Aurich and Emden, and the Bremen Canal, between the Hamme and the Swinge, which serve to drain the moors, and to transport the turf and peat which yield them.

Climate.—The climate is moist near the ocean, and fogs and heavy winds are frequent; in the south it is dry and colder; and in some parts of the country marsh fivers prevail, although the general character of the climate in H. may be characterised as healthy. The mean annual temperature is 46°; winter, 28 7°; and summer, 64°. Extremes are rare. The average annual fall of rain is 28 inches.

Soil. Products.—The soil is generally of inferior quality, although it varies considerably in different districts. Agriculture is in a very backward condition, and notwithstanding some improvements which have been made of late years, large tracts of land, which are well adapted for cultivation, lie waste in every part of the country. The great subdivision of the land, and the consequent absence of capital, are the main causes of this imperfect mode of agriculture. The following proportions are given by Marcard for the distribution of the land in Hanover. Arable, meadow, and garden land, 5,833,090 morgen (the morgen is 0.6310 acre); forest, 2,242,000; waste lands, 5,314,000.

The richest corn-growing districts are Hildesheim, Göttingen, and Kalenberg, and the marsh-lands near the Elbe and Weser; rye is grown for the purpose of making bread, and largely used by the rural population. The turf obtained from the peat-moors in the north and north-west districts constitutes the only kind of fuel used in some parts of the country, and is obtained and consumed in very large quantities. Cattle, horses, and geese are extensively reared, and the manufacture of English and colonial products, wine and spirits, and silk. Emden is the principal trading port, but the chief sea-trade of the country is effected through Hamburg and Bremen, while H. has an extensive commercial and transit business with Leipsic and Frankfort-on-the-Maine. Besides, Emden, Papenburg, Harburg, Lehe, and Leer, are rising into some note as trading ports. H. has good high-roads, and its postal system is well organised. The length of its post and high-roads is estimated at upwards of 35,000 miles, and that of the lines of railway in operation (in 1881) at 500 miles. The latter, together with the telegraph lines (665 miles in extent), belong exclusively to the state.

Revenue.—The revenue amounts, according to the budget for 1861—1862, to 19,588,322 thalers (the thaler was 28. 10½d.). While the expenditure for the same year was 18,769,941 thalers. The national debt had risen in 1861 to 7,051,600 thalers, including a debt for railways of 30,623,073 thalers.

Army.—The army number nearly 27,000 men. The service is four a year, and the number of men for this year's service is, however, only partial, being limited to the reserved corps. The principal fortresses are those of Stade, Harburg, and Fort-William, in the harbour of Bremen. H. furnishes 15,220 men to the
German Confederation, and has further votes in the Tenen, or Full Council of the diet.

Religion, Education, etc.—The population of H., now numbered as follows: Lutherans, 1,517,890; Reformed, 95,214; Roman Catholics, 217,463; different Christian sects, 1718; Jews, 11,701. Religious matters are under the direction of Lutheranism (Evangelical) and Reformed churches at Hanover, Stade, Otterndorf, Aurich, Hadeln; the see of Osnabrück, which is held alternately by a Roman Catholic and a secular Protestant bishop; and the Roman Catholic see of Hildesheim. —H., like other countries of Northern Germany, is amply provided with educational institutions. It has one university at Göttingen, 17 high and 13 lower gymnasia, 5 normal and 21 polytechnic schools, a military academy at Hanover, a 'Foundation Pedagogium' at Hefel, schools of surgery and midwifery, of that at Celle is the most esteemed, schools for the blind, deaf and dumb, and about 3600 free parish schools, which are in most cases dependent upon the local church parties, whether Protestant or Catholic. There are several good mining and forest schools in different parts of the kingdom.

The poor are provided for partly by voluntary subventions partly by the own labour in the poor-houses erected for the reception of persons in want. There are partially self-supporting reformatories at Emden and Celle, while Hanover, Hameln, Göttingen, Lüneburg, Emden, and Hildesheim have all their separate houses of detention and poor-houses.

Law.—The administration of the law is presided over by a special ministry. Criminal cases have, since 1848, been tried before sworn juries.

Government.—H. is a sovereign kingdom since 1814. The monarchy is hereditary in the male line, and the administration is conducted by a responsible ministry with two representative chambers, whose concurrence is essential to the exercise of certain prerogatives of the crown. The upper of the two chambers consists of the princes of the blood-royal; several mediatised princes, and other members of the higher nobility; four members nominated by the king; and fifty other members. Half the number of the elected representatives retire every third year. The lower chamber consists of 2 of the members of the ministry nominated by the king, 2 deputes appointed by each chamber itself of representatives of towns and boroughs, and 44 members for the country districts. There are, moreover, 7 provincial assemblies, whose concurrence and assent are necessary for the pronouncement of laws and the levying of taxes within their several districts.

The highest department of the government is the Council of State. The cabinet which, since 1848, has been composed of responsible members, comprises seven ministers, each of whom presides over a special department of the administration. The chambers are summoned every two years, but the diet or landtag is septennial. The monetary system, and the weights and measures of H., are the same as those adopted by the German Zollverein (q.v.).

People.—The Hanoverians are a mixed race: those inhabiting the north-eastern and central provinces are mostly Saxons, but those on the coasts of Frisian origin; those on the west of the Ems, Dutch; and those in the southern provinces, Thuringians and Franc-arians. Platt-Dutch, or Low German, is commonly spoken in all the rural districts, excepting the border parts between the Netherlands and H., in which Dutch is the ordinary form of speech; while High German, as in every other part, of Germany, is the language of the educated and higher classes.

History. — The country at present included in the kingdom of H. was occupied in remote ages by Saxons tribes, which after a long-continued struggle under their leader Wittikind, submitted to the dominion of Charlemagne, and embraced Christianity. H. continued to form part of the Frankish empire, and bore the name of the Empire of the Frisians, with its capital at the city of Saxony. H., when Ludolf of Meissen incorporated it in the duchy of Saxony. In 931, the Emperor Otto I., who had inherited Saxony from his father Henry I., the hereditary duke, bestowed it on Hermann Billing, on the extinction of whose family in 1196, it passed to Lottharia of Suppinburg. By the marriage of Lottharia with Richenza of Nordheim, new territories were added to the duchy, which passed to the family of the Guephre through their descendant Gertrude, who married Henry the Proud of Bavaria. Henry the Lion, the son of the latter, did much to advance the civilization and commerce of his subjects by conferring rights and privileges upon various towns which had advocated his cause; but when he fell under the ban of the empire, a period of anarchy and confusion succeeded, which at first threatened the ruin of the country. When the Emperor Henry IV., with all his forces, had retained his hereditary lands of Brunswick and Lüneburg through the special favour of the emperor.

The Reformation early found adherents among the burgher and rural populations of H.; but as the new doctrines spread, several rebellions of their own labour in the poor-houses erected for the reception of persons in want. There are partially self-supporting reformatories at Emden and Celle, while Hanover, Hameln, Göttingen, Lüneburg, Emden, and Hildesheim have all their separate houses of detention and poor-houses.

The highest department of the government is the Council of State. The cabinet which, since 1848, has been composed of responsible members, comprises seven ministers, each of whom presides over a special department of the administration. The chambers are summoned every two years, but the diet or landtag is septennial. The monetary system, and the weights and measures of H., are the same as those adopted by the German Zollverein (q.v.).

People.—The Hanoverians are a mixed race: those inhabiting the north-eastern and central provinces are mostly Saxons, but those on the coasts of Frisian origin; those on the west of the Ems, Dutch; and those in the southern provinces, Thuringians and Franc-arians. Platt-Dutch, or Low German, is commonly spoken in all the rural districts, excepting the border parts between the Netherlands and H., in which Dutch is the ordinary form of speech; while High German, as in every other part,
capital; entered into an alliance with the emperor against France and Sweden; sent an army into Hungary to resist the Turks; and in 1688, lent troops and money to William of Orange against James II. of England.

With George Lewis, king of England, and the second elector of H. or Brunswick-Luneburg, a brighter epoch opened to the Hanoverians, who, out of the ruins of 1714, recovered not only the time of the empire, but that portion of the empire which the Hanoverian ports and rivers formed the regular channels of communication with the rest of Germany. In 1793, Hanoverian troops took part in the wars against the French republic, but the expenses caused the kingdom to fall into debt; its deficit was defrayed by England and France; and it was not till 1801, when Prussia, refusing to acknowledge the neutrality of H., threw troops into the electorate, that H. suffered from the consequences of the anomalous position in which its relations to England placed it in regard to the other states of Germany. The Prussian troops evacuated H. at the close of the same year, in accordance with the treaty entered into between France and England; but the claims and counter-claims which arose from this occupation, gave rise to protracted discussions, which were not finally settled till 1830, when it was stipulated by treaty that H. was to pay to Prussia an indemnity of 575,000 thalers. In 1799, when the French invaded England and France, Napoleon threw an army, under the command of Mortier, into H., and the result of this measure was to compel the Hanoverian government to convene a convention of 140 delegates from the French general, by which it bound itself to abstain from serving against France during the pending war; to give up fortresses, arms, and horses to the enemy; to subsidize French troops; and to participate unconditionally in the general costs of the war. A large number of the army, however, having contrived to evade signing these articles of surrender, went over to England, where the men were incorporated into the German legion, which did good service both in the Peninsula war, and in the Belgian campaign of 1815, which terminated in the battle of Waterloo. In 1806, Napoleon, after having ceded H. to Prussia, and again withdrawn it appropriated a portion of the electorate to complete the newly-formed kingdom of Westphalia, which in 1810 received the whole of the Hanoverian territory. Finally, H. was united with France, and the north-west portion divided into the departments of Luneburg, Eastphalia, Harz, and Bentheim, while the south-east portions formed the Westphalian departments of Atter and Harz. After the expulsion of the French, H. was elevated to the rank of a kingdom in 1814. In the same year, the Prince Regent, was ceded by France to the young king, who, in 1814, had been elected king of H.; and in 1819 a new constitution was granted to the state, in accordance with which the provincial states were retained and enlarged, and two representative chambers associated with them. Very little was done in H. towards the time of the revolution of 1830, when multiply the administration, and the general dissatisfaction and distrust had risen to the highest pitch, when William IV. ascended the throne. The influence of the French revolution of July (1830) extended to H., and in 1831, disturbances broke out at Detmold and Göttingen. These were speedily put down, but as the national discontent did not abate, the prime minister, Count Munster, who had long been obnoxious to the mass of the people, was dismissed, and the Duke of Cambridge, who had hitherto acted as governor-general, invested with the title of viceroy, and intrusted with very extensive powers.

The duke recommended gradual reforms, but as the popular feeling was decidedly in favour of a thoroughly remodelled constitution, the states were again convoked; and finally, in 1833, a draft of the proposed constitution, which had been prepared by a commission appointed by the ministry and the states, was laid before William IV. It had been considerably modified in England, it received his signature, September 26, 1833, without having been again submitted to the assembly of the states. The death of William IV. in 1841, placed H. under the rule of the new maintenance heir, Prince of Cumberland. One of the first measures of the new king was to abrogate the constitution of 1833, to which he had from the time of its adoption refused to give his assent, and to restore that of 1819.

When the government demanded the oath of allegiance from all persons holding office under the state, seven of the Göttingen professors — viz. Dahlmann, Gervinus, J. Grimm, F. Grimm, Ewald, Albrecht, and J. G. Herder — refused to take the required oath, in consequence of which all were deprived, without any preliminary investigation, of their chairs, and the three first named banished from the country.

From this period till 1848, when the success of the French revolution compelled the German rulers to adopt a more liberal policy towards their subjects, the king showed himself resolutely averse to these movements. Liberal reforms were at length introduced, and the new constitution of 1848 was more liberal than that of 1833. The king, moreover, organised some useful reforms in the internal administration, and effected great improvements in several of the towns.

The chambers of H. shewed great zeal in the reorganisation of Germany, and King Ernest entered into a triple alliance with Prussia and Saxony, to promote the unity of the German nation. Unlike many of his German contemporaries, King Ernest kept the promises which he had made to his people during the revolutionary crisis of 1848—1849; and although the nobility made the most pressing appeals to him for the recovery of their ancient privileges, and the overthrow of the constitution, he refused to withdraw his pledge that the country should be governed in accordance with constitutional principles; and such confidence was placed in his word, that, notwithstanding his acrimonious opinions, his death, in 1851, was regarded as a serious blow to the cause of reform, for his son and successor, George V., was known to hold very extreme views in regard to the kingly power and the claims of the aristocracy. Theearly measures of the new king were not calculated to allay the
fears entertained of his policy; but the decisive declaration of the assembly of the states that they would desirous of seeing the reforms completed which had been begun by the late king, and their vote or want of confidence in the new cabinet, prevented any marked retrogressive movement in the part of the ministry, and in 1854 H. joined the Zollverein. In 1855, the constitution underwent various modifications in accordance with the demands of the federal diet, by which it was made to approximate more closely to that of 1840. Although the changes were unpopular, they met with no energetic opposition, and since then the nation has passively tolerated the federal policy of the government.

HANOVER, the capital of the kingdom, and the chief town of the province of Hanover, is an irregularly built town, situated on the banks of the Leine—which is crossed by ten bridges, and is navigable—its fine-gallery of paintings; its chapel, in which are preserved numerous relics and antiquities, many of which were brought from Palestine by Henry the Lion in 1172; and an altar-piece by L. Cranach. Among the charitable institutions of H. are the orphan school of the Visitation Order, for the boys and orphans, hospitals, and poor-houses, the latter of which are principally supported by private subscription. H. is well provided with educational institutions, the most noteworthy of which are the Georgium, a collegiate school for the sons of nobles; a lyceum, and a gymnasia. The city has also polytechnic, normal, and medical schools, and 25 free public schools. H. was the first place in Germany that was lighted with gas (1852). The discovery of a rich bed of asphalt in the neighbourhood of the town has been the means of giving the streets better side-pavements than most other German towns possess. While the recent improvements that have been effected in the old system of sewers, which dates from the 16th c., render the drainage particularly good. H. has gained pleasant walks and pleasure-grounds by the levelling and planting of the ramparts, while in the immediate vicinity of the town are the royal palaces of Herrenhausen and Moonbrillant, whose beautiful grounds and gardens are freely opened to the public.

The chief manufactures, none of which are very considerable, are gold and silver wares, wax-chests, bronze and plated goods, starch, liqueurs, etc. The Egostoff ironworks are especially noted for their engines, and the salt-works, owned by the same proprietor in the neighbourhood of the city, are of considerable importance.

HANSARD, a well-known name in connection with the printing of the British parliamentary records. The first of the family was Luke H., who was born in 1752 at Norwich, and coming to London, worked for some years as compositor in the office of the Morning Chronicle and the House of Commons and Stationers; and in 1800 succeeded Hughes as sole proprietor of the business, which is still carried on by his family. Competition and other causes have led to a division of the parliamentary printing, but the Messrs Hansard still print the ballots for the House, reports of committees, and some of the accounts.

The name of H. is connected with an important question of parliamentary privilege. The case was briefly as follows: A bookseller named Stockdale printed a libel against the Messrs H., the libel consisting of statements in the parliamentary reports which the latter had printed, and Lord Chief-justice Denman decided in favour of Stockdale in the Court of Common pleas. He complained of a breach of privilege, and another action was raised in the Court of Queen's Bench, but, as before, the plea of the orders and privileges of the House was overruled. After a third action had been brought, with similar results, the act of parliament was passed, directing that any proceedings against persons for publication of printed papers by order of either House of Parliament are to be stayed by the courts of law, upon delivery of a certificate and affidavit that the proceeding is by order of either House.

The Hansards are, however, most widely known by the reports of the debates in parliament, which are published by them and bear their name. When charges of inconsistency are made in parliament, they are usually verified by a quotation from Hansard, the accuracy of which is seldom or never disputed. An opinion, in consequence, widely prevails that the Messrs H. retain a corps of parliamentary short-hand writers in their service, from whose stenographic reports of debates printed and mailed are prepared. This popular impression is entirely erroneous. The speeches printed in Hansard are taken in the gross from the London morning newspapers. They are usually sent to the peers or members of parliament, and they are spoken with accuracy, punctuation, and correction, and many important alterations, expurgations, and additions are made in the speeches thus revised, when a speaker has been led away by the heat of debate, or has, on the other hand, failed to say all that was in his mind when he last spoke. The convenience, however, of possessing some record more or less authentic of parliamentary proceedings, has led the executive government to take a certain number of copies of Hansard for distribution among the public offices and departments. Many peers and members of parliament, foreign governments, and public libraries, also subscribe to this work, which is issued at a certain fixed price, which the Messrs H. charged. When the commencement of each session, shall not be exceeded.

HANSEATIC LEAGUE, the, or the HANSA, was a trade-union established in the 13th c. by certain cities of Northern Germany, for their mutual safety, and for the protection of their trade, which at that period was exposed to the rapacity of rulers, and the lawless attacks of marauders on land and pirates at sea; yet, notwithstanding obstacles such as these, and the heavy imposts levied on the German traders by their princes, several towns of Northern Germany, as, for instance, Hamburg
HANSEATIC LEAGUE

Lubeck, and Bremen, had acquired some commercial importance as early as the 11th century, only the Hanseatic League had ever matched it. The fame of the rich cargoes that found their way into their factories had given rise to swarms of pirates, who infested the mouths of the Elbe, and the outlets to the Baltic; and the necessity which the neighbouring ports felt of protecting themselves everlastingly from such troublesome enemies, led, in 1219, to the settlement of a compact between Hamburg, Dithmarsch, and Hadeln, to protect the course of the river and the adjacent sea. This compact was followed two years later by a treaty of mutual aid and defence between Hamburg and Lübeck, which was joined, in 1247, by the town of Brunswick; and thus was formed the German Hanse. The name of which is indicated, in the Plattendeutsch of the traders, a bond or compact for mutual aid. The progress of the League was so rapid, that before the year 1260, when the first diet met at Lübeck, which was the central point of the whole association, it had its regular organised government, with a fixed system of finance and administration.

The entire League, which at one period numbered 83 towns, and included every city of importance between the Azores and Norway, was divided into three classes or circles: 1. The Vandal or Wendic cities of the Baltic; 2. The towns of Westphalia, the Rhine- land, and the Netherlands; 3. Those of Saxony and Brandenburg; 4. Those of Prussia and Livonia. The capital of the League was Lübeck; Cologne, Brunswick, and Danzig.

The cities composing the League were represented by deputies at the general diet, which met every three years, generally at Lübeck, which was con- sidered the capital of the League, to discuss and settle the current business of the League, and held as extraordinary meetings every ten years, to renew its various unions which constituted the great Hanseatic League. The edict of the diet was communicated to the masters of the great Circles, who remitted them to the several guilds within their respective jurisdictions.

Four large foreign factories were established at Lübeck (1252), Bremen (1253), Hamburg (1270), and Bergen (1278); and besides these and the ordinary members, various cities were connected by treaties of limited alliance with the League; as, for instance, Amsterdam, Antwerp, Bordeaux, Barcel- lona, Cadiz, Dublin, Livorno, Messina, Naples, Ostend, Rotterdam, Rouen, Seville, St Malo.

The Hanseatic League was the first systematic trade-union known in the history of European nations, and the high political influence which it rapidly attained, was due to its development of sounder principles of trade than any that had hitherto been put into practice; while in the earlier periods of its existence, it exerted a beneficial action on the advance of civilisation, which can scarcely be overrated. Its professed object was to protect the commerce of its members by land and by sea, to defend and extend its commercial relations with all foreign nations, and as far as possible to exclude all other competitors in trade, and firmly to maintain, and, if possible, extend, all the rights and immunities that had been granted by various rulers to the corporation. For the promotion of these ends, the League kept up a fleet of armed men, and a body of hired clerks and serving-men were employed, and an almost monastic discipline was enforced; but the by-laws of the League prescribed a system of

daily sports and light occupations for the recreation of the members, while sensible regulations for their comfort and cleanliness, and for the celebration of festivals at certain fixed times of the year, bear evidence of the sound sense that influenced the mode of government of the Hansa, and which was further shewn by the injudiciousness to the masters of factories and everything that could hurt the prejudices of the foreigners among whom they were placed, and to conform in all things lawful to the habits of the country.

For many years the Hanseatic League was the undisputed mistress of the Baltic and German Ocean. It created new centres of trade and civilisation in numerous parts of Northern Europe, and contributed to the expansion of agriculture and other industrial arts, by opening new channels of communication by means of the canals and roads with which it connected together the members of its association. The greatest powers dreaded its hostility and sought for alliances, and many of the powerful sovereigns of the middle ages were indebted to it for the most substantial benefits.

In England, since the time of King Ethelred, German traders had enjoyed the same privileges with the native Englishmen. The Towns, as the Hansa merchants, together with the house which they occupied on the Thames, specially under his protection, allowing to them and their successors the privilege of exporting goods free of duty, and selling their wares for the same price, and which French wines were then sold in London; and in 1261 these privileges were extended by Henry III. to all the Germans in London who had a share in the Hanseatic Factory, or Aula Teutonica, which was long known to Londoners as the Hanseatic Yard. In 1338, the Hansards gained the goodwill of Edward III. by supplying him with the money necessary to redeem the regalia and coronation jewels of his queen, which he had pledged to Cologne money-lenders, and by allowing him to draw upon their houses for large sums with which to defray the cost of his French wars. Their relations to other sovereigns at that period were equally significant of their importance, for the greatest Kings of France, England, Germany, the Netherlands, and the Duke of Burgundy, granted to the members of the League the right to reside in their different dominions, in the towns of Bruges, Dunkirk, Antwerp, Ghent, Middelburg, Rotterdam, Yssel, Blankenese, Livonia, Poland, and Mecklenburg; and in 1348, deposed Magnus of Sweden, and bestowed his crown upon Duke Albert of Mecklenburg; and in 1426 equipped a fleet of 248 ships, carrying 12,000 soldiers, against Eric of Denmark.

With the fifteenth century, the League reached at once its culminating point and its decline, for in proportion as the seas and roads were better protected by the states to which they belonged, and rulers learned to comprehend the commercial advantages of their dominions, its supremacy declined; while the discovery of America, and of a new sea-route to India, gave an entirely different direction to the trade of Europe. The Hanse had, moreover, arrogated to itself, in the course of time, presumed rights of imposing the greater and lesser ban, and exercising acts of sovereignty and judicial power, which were incompatible with the supremacy of the rulers in whose states they were enforced, and hence the League was necessarily brought into frequent hostile collision with the local authorities. Thus, in accordance with their system of exclusive policy, the Hanseatics refused to grant to merchants trading in foreign parts the same privileges in the Hanseatic cities which they themselves had enjoyed for centuries in England, Italy, and Scandinavia, and thus arose dissensions, which not unfrequently ended in a fierce maritime warfare. By way of retaliation for the pertinacity with which the League refused
to grant to the English the same immunities which had been accorded to traders of other nations, parliament required that Germans should pay the tax on wool and wine, which was exacted from all the foreigners in the English markets, and although the Hansards strongly resisted, they were at length condemned by the courts, in 1469, to pay a fine of £13,500; and they would probably have lost all they possessed in England, if their cause were not advocated by N. Edward L. who had more than once been indebted to them for money and aid, and who in 1474 secured for them, by a clause in the treaty of Utrecht, a restitution of nearly all their former rights in England. In 1528, federal diet.—See Saxony in insisting upon the maintenance of their old prerogatives, notwithstanding the altered condition of the times, drew upon them the anger of Queen Elizabeth, who despatched a fleet under Drake and Norris to seize up-in the ships of the Hanse, of which 61 were captured, while she banished the Hansards from their factory in London. These measures had the desired effect of compelling the Lübeck to receive English traders on equal conditions, and then, toward the end of 1532, they were permitted to occupy the Steyrdy, as in olden times. The Hansa had, however, outlived its date, and at the diet held at Lübeck in 1630, the majority of the citi-zens formally renounced their alliance. Hamburg, Lübeck, Bri-ven, and, for a short time, Danzig, remained faithful to their ancient compact, and continued to form an association of free republics, that existed unchanged till 1810, when the first wars were perpetrated by Napoleon in the French empire. These, in 1813, combined with Frankfort-on-the-Maine to form a union, known as the 'Free Hanseatic Cities,' and constituting a corporate member of the German confederation, with one joint head. See Hamburg, Kündliche Gesch. d. Ursprungs d. deutch. Hansa (1802); J. M. Lappenberg, Urban. Gesch. d. Hansb. Stadthof. z. London (1851); R. Paul, Pictures of Old England (1861).

HANSE, a town of the district of Hurriannah, under the sub-presidency of the North-west Provinces of India, lies 86 miles to the north-west of Delhi, in lat. 29° 6' N., and long. 76° 3' E. It is watered by a branch of the Delhi Canal, made in 1356 by Feroz Tughluk, and cleared in 1825 by the British government. This work, besides its domestic and agricultural uses, is invaluable for navigation. The place is said to contain about 10,000 inhabitants.

HANSTEEN, CHRISTOPH, a Norwegian astronomer, was born at Christiana, 26th September 1754. At first intended for the legal profession, he subsequently devoted himself entirely to the study of mathematical science. In 1814, he was appointed to the chair of mathematics in the university of Christiania, and there, in 1819, published his celebrated work on Magnetism, which was afterwards translated into German under the title of Untersuchungen über das Magnetische der Erde. This produced a great sensation, especially in England, so much so, that in almost all the voyages of discovery since undertaken, magnetic observations have been made in conformity to his directions. In 1821, he discovered the谋着 to the magnetic force. See Magnetism. After having visited London, Paris, Hamburg, Berlin, and different parts of his native country, he resolved to undertake a journey to Siberia, for the purpose of continuing his magnetic observations, which he accomplished from 1822 to 1830, and returned to Europe with a large collection of facts, which were of much service in aiding to dispel the obscurity which enveloped and still partly envelops this subject. On his return to Christiania, he prevailed upon the government to erect an observatory, fitted also for magnetic observations. Besides his chair in the university, he is professor of mathematics in the navy, and has superintended the triangulation of Norway. His other works are, De Mutationibus quas sublatus Momentum virg. Magnetica partim ob Tempores, partim ob Temperature Mutaciones (Christiania, 1842); besides a work on Mechanics, another on Geometry, and several memoirs of which the greater part are inserted in the Magazin für Naturwissenschaften.

HANUMAN, or HANÜMÁN (the nominative of the Sanskrit base Hanumāt or Hanumānt, literally meaning, 'having a jaw,' but understood to imply 'having a broken jaw'), is the name of a fabulous monkey, who plays a great rôle in the legendary history of the second or classical period of Hindu mythology. He is represented there as the strenuous friend and ally of Vishnun, when the latter, in his incarnation as Rāma, made his expedition to Ceylon, in order to recover his wife Sītā, carried off by the giant Rāvana. See Vishnun. In the war between Rāma and Rāvana, Hanuman, on one occasion, is related to have leaped the mountain-part of the continent of India and Ceylon with rocks of a prodigious size, which he and his friends threw into the sea; on another, to have set Lankā on fire by means of igniting his tail, previously dipped into combustible mixtures; and when, to reward him, his friends slain in battle by the armies of Rāvana, he flew to the Himalayas, where he intended to gather the magical herbs required for his purpose, he grew impatient at not finding them quickly, and tore off the virus of the mountains; he then carried to Lankā, the capital of Ceylon. Such and many other extraordinary feats are related of this 'chieftain of the monkey tribe,' especially in the great poem Rāmdhānu, which is devoted to the history of Vishnun in his descent on earth as Rāma, and in many of its chapters dwells with particular pre- diction on Hanumun the monkey. Of his origin and his first dealings, the older version of this epos gives us the following account: His mother was an Apsara or nymph, Purñjakāsha, who, through some curse, however, was born as the daughter of a monkey, and under the name of Anjan, became the wife of the monkey Kesurin. Possessing the power of变成了 any shape at pleasure, she once transformed herself into a human being, and walked in splendid attire on the top of a mountain. There, Vāyu, the god of wind, caught sight of her, and became bewitched with love. The result of his stormy courtship, though purely ideal, as he at least explained it to her, was the child Hanumun. The later version of the Rāmdhānu adds to this story a preposterous incident to justify, as it were, the liberty which the god took with the wife of Kesurin, by making him set under the promise of a Rishi or saint. When a child, Hanumun, while once lying on the lap of his mother, saw the sun rise, and thinking it was a fruit, conceived the desire of eating it; taking it up he started, therefore, into the air; but Indra, angry at his presumption, hurled him down with his fiery thunderbolt to the top of the mountain, where in his fall he broke his left jaw.

The numerous pictures and sculptures by which this singular history has been illustrated, offer perhaps the only parallel events of his history. He appears either in a fighting posture, armed with disk, sword, or trident, and trampling on some vanquished foe; or he is carrying the rocks with which he bridged over the sea; or he is in the attitude of a worshipper—which means of Vishnun. Frequently his figure is single; sometimes it is connected with that of Garuda, the sacred bird-vehicle of Vishnun;
HAPSBURG—HARALD III.

and it is never missing in those groups which emble-
matically represent the principal facts of Rama's
life. Those not very familiar with the meaning
of Hindu beliefs, will never fail to recognize him by his
prodigies.

That Hanuman is the type of the monkeys
worshipped by a certain class of Hindus, requires no
further remark, nor will it be necessary to say
that this monkey-worship, to which so early a writer as
Megasthenes ascribed a origin, is of the numerous
monkeys coming to the town Latage
—probably in the north of India—and being fed
there daily, has its origin in the devotion to the
monkey of Hanuman, that great hero

The foundation of the myth is probably an historical
one. There is no reason to doubt tradition when it
tells us that a hero—it calls him Rama—carried
Brahmanic institutions from the north of India to
Greece and Persia, with the massive
promulsion of the vapour which is attracted
with this event a cause which transformed this
expedition into a war between the Brahmanic
population of India and that of Ceylon. Nor is it
impossible that Rama, on his march to the south,
formed alliances, and that he ascribed to
their barbarous condition, were compared by his
followers to monkeys. There, however, all that
may be real in the myth of Hanuman seems to end,
for its other ingredients are either purely legendary,
or represent phenomena of a physical condition.

But Rama ceased to be the human hero, and became
an incarnation of Vishnu, it followed, as a necessary
consequence, that the history of all the circum-
sstances connected with this change also became
in part legendary, and in part was imbued by the
character which belonged to the god. It is
the latter influence which is especially perceivable in
the origin ascribed to Hanuman. Vishnu is in the
Vedas a deity representing attributes of Vi
sun, and the legends of the birth of his ally are such as
would originate in phenomena connected with sun-
rise. To this the names ascribed to his mother
seem to point; for the Apurans 'were originally
personifications of the vapour which is attracted
by the sun, and form into mists or clouds' (see
Goldstücker's Sanscrit Dictionary under the word
'Apuras'); and Ajñand, among other meanings,
signifies night.

HAUSBRUG, or HABSBURG, House of, or
which the imperial family of Austria are the represen-
tatives, derived its name from the castle of
Habburg or Halichtshburg (Hawk's Castle), on the
right bank of the Aar, in the Swiss canton of
Aargau. The castle was built in the 11th c. by
Werner, Bishop of Strasburg, grandson of Guntrun
the Rich, Count of Alsace and Breisgau, who, accord-
ing to the Austrian chroniclers, was descended from
Ethico I., Duke of Alemannia and Alsace in the 7th
century. Werner delivered the castle to his
brother Kanzeline, whose nephew, Werner II., was
the first who assumed the title of Count of Haps-
burg. Albrecht or Albert III., the great-grandson
of Werner II., assumed the title of Landgraf of Upper
Alsace and Swabia, and the Aargau, to which his
son, Rudolf I., added Laufenburg. On his death in
1232, his sons, Albert IV. and
Rudolf II., divided their father's possessions—Rudolf
becoming the founder of the Hapsburg-Laufenburg
line. This branch became extinct in 1408 in Ger-
many, but is still represented in England by the
Fielding family. The whole possessions of Rudolf's
lineage reverted to the Austrian line in 1415. Albert
IV. laid the foundation of the future greatness
of the House of Hapsburg. He left three sons,
the eldest of whom, Rudolf III. (Rudolf I. of Austria),
succeeded him, and by appropriating the provinces
which, as emperor, he had wrested from Ottonian
Bohemia—viz., Upper and Lower Austria, Styria,
Carinthia, and Carniola—greatly increased the
power of his family. His son, Albrecht or Albert I.
(q.v.), succeeded to the family possessions.

The further history of the House of H. may be
traced in that of Austria (q.v.). It may be noted
here that Ernest, surnamed the Iron, one of the sons
of Leopold II., and founder of the Styrian line,
marrried Cynburga, daughter of Ziemowit, Duke
of Masovia (now province of Warsaw), and niece of
Uladaslas Jagellon, King of Poland, celebrated in
Austrian history not only for her beauty and
accomplishments, but also for her great strength of
body, of which latter quality some historians give
remarkable instances. From her are said to be
derived the thick lips which are a characteristic
feature of the Austrian family.

Compare Prince Lieknowski, Geschichte des
Haus Habsburg (2 vols. Wien, 1836—1837), also
Coxe's House of Austria.

HARALD I. (Surnamed Haarfarger, or beautiful-
haired), king of Norway (863—930), was a descendant
of the ancient race of the Ynglings in Sweden, and
the son of Haldan Svarte, a powerful jarl in
Norway, who was as early as 834 king of
his country. According to the popular saga, H. was
induced to attempt the subjugation of the whole
of Norway, through his love to a high-born maiden,
named Gyda, who declared that she would not
be his wife until he was king of his country.
He swore that he would neither cut nor comb his
hair till he had subdued all the land to his sway—
an oath which he kept. After many years' contest
with his brother jarls, he finally reduced the whole
of the country from the Stor Fjord to the Stor
Bjornoy; and after defeating the last general confederacy
of the independent Norwegian chieftains in a naval
battle at Hafursfjord, the present Stavengerford,
he remained sole ruler of the land (872). Previously
to his reign, Norway, like the other Scandinavian
countries, had been divided into numerous inde-
pendent districts or tribes, governed by their
several kings. H., however, replaced all these rulers
by jarls of his own choosing, who were either barons
or bailiffs, to whom was committed the charge
of seeing that the tax which was imposed over all the
land was faithfully paid. H.'s severity compelled
the deposed rulers to seek other homes; and his
reign is memorable for the freedom which
they enjoyed. As it was by these exiles, too,
that the Orkneys were settled by the fugitive
Einar, the son of the king's friend, Rognvald, Jarl of More; while another
son, Ganger Kol, who had incurred H.'s anger by
repeated acts of piracy, sailed with his followers
in 876 to France, where he founded the Norman
power. Other exiled Norwegian jarls or kings
colonised the Hebrides, Shetland and Faroe Islands,
and Iceland, whence they continued their cus-
tomary sea-roving and plundering until those islands,
with the exception of Iceland, were subdued by
Hahald. Although a barbarian, he ruled with a
sound policy in advance of his age, and by his
firmness succeeded for some time in suppressing
the private warfare and sea-piracy which had prevailed
in Norway before his reign; but the dissen-
sions of his numerous sons checked all the good
that might have resulted from his measures.

To restore concord in his family, he divided the
large possessions among his children, reserving only the supreme
power to himself. He died in 933 at Trondheim,
where he had made his capital, and was succeeded
by his son, Eric Bloodaxe, or the Bloodax, to whom
he had three years before resigned the government.

HARALD III. (Surnamed Harfandraede, or
389
HARALD III—HARBOUR.

Double Beard], king of Norway (1047—1067), was the son of Sigurd, chief of Stangriuwe, and a descendant of Harald I. In his boyhood, he was present at the battle of Sticklestad, in which his brother Olaf, surnamed the Saint, king of Norway, was slain; and he afterward sought an asylum at the court of his relative, Jaroslav, Duke of Russia, whose daughter he sought in marriage. The rejection of his suit, however, again drove him forth, and he entered upon romantic adventures; and having gone to Quene, and become captain of the Vaeringjar, or Scandinavian body-guard of the Greek emperors, he experienced many marvellous adventures, which have supplied abundant materials for the narratives of the older sagas and modern romances of the north. He took part in the expedition against the pirates of the Mediterranean; visited Jerusalem, where he fought successfully against the Saracens, whom he also defeated in Sicily and Africa in eighteen pitched battles. On his return to Constantinople, he drew upon himself the vengeance of the Empress Zoe, whose proffered love he had rejected, and with difficulty escaped from the prison into which he had been thrown, on pretence of illness. Having made his escape, he returned to Russia, married the daughter of Duke Jaroslav, and took her with him to Norway, where his nephew, Magnus (the son of St Olaf), agreed to divide the supreme power with him, in return for a share of his treasures. The death of Magnus in 1047 left him sole king of Norway. His unruly spirit would not, however, suffer him to rest; and in opposition to the pledge he had given his dying nephew, he entered into a war to deal a certain blow for the benefit of Denmark, on whose crown he had no just claim. Although he was successful in battle against the Danes, he gained no real advantages by the contest; and in 1046 he recognised the right of Svend, the nephew of Canute, to the throne of Denmark, and having concluded a peace, occupied himself for a time with the internal affairs of Norway. In 1056 he landed in England, to aid Tostig against his brother Harold, king of England, but was slain in battle; his followers, after having fought with desperation, were obliged to retreat to their ships, in which they sailed for Norway, under the command of Olaf, the son of the slain monarch (25th September 1066).

HARBOURS are inlets of the sea, so protected from the winds and waves, whether by natural conformation, or by artificial means, as to form a secure roadstead for ships. It is with those harbours wholly or in part artificial that this article will deal. Harbours may be divided into harbours of refuge, and those for commercial purposes. The latter are mostly tidal—i.e., capable of being entered by larger vessels only at certain states of the tide; they are usually formed by improving some existing inlet, such as the mouth of a river. The former are roadsteads of good depth, protected by breakwaters, and accessible at all tides, where ships may take refuge during storms. The two kinds are sometimes combined, there being the harbour proper, and a commercial roadstead outside of it, as at Cherbourg and elsewhere. See BREAKWATER, CHERBOURG, DOVER, PLYMOUTH, PORTLAND, HOLYHEAD.

With the birth of commerce and naval warfare, in the thirteenth century, as a result of the need for navigation, there was a great increase in the necessity for artificial harbours. The Phoenicians, the fathers of navigation, soon set to work to protect their scanty strip of Levantine coast; and ere long provided the richly freighted argosies, that their energy and wealth brought into being, with artificial ports. At Tyre, two harbours were formed, to the north and to the south of the peninsula on which the city was placed. The northern and principal of the two was provided with an inner harbour, quays, landing-places, &c., and from the remains still existing, was evidently a work of great magnitude. At Sidon, similar but less extensive works long testified to the wealth and engineering genius of the Phoenicians. The breakwaters were principally constructed of loose rubble.

Carthage, in another part of the Mediterranean, also possessed a harbour, though its site is not very satisfactorily determined. It was in two divisions, formed by mole, and it generally supposed to have been situated behind an island named Coton; time, however, has dealt so hardly with it, that few traces remain. Still keeping to the great inland sea, we come to Greece; but here nature had provided so many navigable inlets, that little remained to be done by man. Nevertheless, some minor works were executed at the Piraeus and elsewhere, chiefly, of course, for warlike purposes. The Romans, finding ships necessary to the dominion of the world, set about constructing harbours for them, in their usual solid and workmanlike manner. The coasts of Italy still shew how well they understood both the principles and the practice of this branch of maritime engineering. It is given, in the history of the ancient port of Ostia (now two or three miles inland), one of their finest and most complete undertakings of this nature. A distinguishing feature of their harbour-making—the open or arched mole—has recently been revived in England. Built with open arches, resting upon stone piers, it gives full play to the tidal and littoral currents, so preventing the deposition of sand-banks; but in proportion as this advantage is increased (by increasing the span of the arches), so also is the agitation, and consequent insecurity of the water within. A small experimental work, said to answer well, has been constructed at Ramsgate on this principle (see fig. 4).

The decay of commerce and civilization, consequent upon the fall of the Roman empire, put a stop to harbour-making; nor could any want of the art be felt, until the revival of commerce by the Italian republics of the middle ages. But the rich traffic of Venice and Genoa soon led to the construction of suitable ports at those places; and the moles of the latter city, and the works in the lagunes of Venice, remain to this day. France was next in the field, embanking, protecting, and deepening the mouths of the rivers along her north-western shores, as at Havre, Dieppe, Dunkirk, &c. In 1627, during the siege of Rosell, Metecon constructed jetties of loose rubble-stone, to prevent access to the city. These works stood...
HARBOUR.

remarkably well, and it is singular that they were not adopted as a model for the famous digue at Cherbourg, instead of the more fanciful plan of De Cessart. See Breakwater, Cherbourg.

Holland, and the other low-lying countries of the north of Europe, has been deeply interested in the marine engineering; but as its principal application was to the reclaiming of land from the sea, it scarcely falls within the scope of this article. Meanwhile, England, whose ocean-commerce is of comparatively recent date, and whose fisheries even scarcely employed a vessel three hundred years ago, lagged far behind her continental rivals. With few exceptions, her ports were absolutely unprotected, or rather uncreated; and this disgraceful state of things continued until late in the last century. One of the few exceptions was Hartlepool, where a harbour was formed about 1250. In the 17th c., at Whitby and Scarborough, also in Yorkshire, rough piers were thrown out, protecting the mouth of the port; while at Yarmouth, in Elizabeth's reign, a north jetty, and subsequently a south one, were formed. An ancient mole existed at Lyme Regis, a section of which, from Mr Smiles's Lives of the Engineers, is given here (see of 3). But the chief efforts of the early English engineers were directed against the shoals and waves of Dover, with but indifferent success, it must be acknowledged; for only now is it becoming evident that the place of refuge intended. When, however, Smeaton rose to vindicate the engineering talent of England, things took a different turn; and now few countries surpass us in the number of artificially improved commercial harbours, or in the just appreciation of their importance.

In the construction of harbours, the great desiderata are sufficient depth of water and perfect security for the vessels likely to frequent them, together with the greatest possible facilities for ingress during any weather; while the chief obstacles to be surmounted are the action of the waves, tides, and currents upon the protecting piers and breakwaters, and the formation of sand-banks and bars. Before proceeding to indicate the means by which these difficulties are overcome, we must first examine them a little more closely.

Waves (q.v.) in deep water possess no motion of translation, but when near enough to a shelving shore their nature is completely changed, and under the name of breakers they are very destructive, exercising a pressure of two, or even three, tons to the square foot.

Tides and Currents are also a source of much destruction to harbour-works. Piers, &c., in a race or rapid tideway, suffer considerably from the friction of the water, and of the detritus carried along by it; though such a tideway running past, and at some distance outside of a harbour, is often found to act as a species of breakwater, checking the ingress of waves from the open sea. But the principal danger to be apprehended from currents is the deposition of the alluvial matter they hold in suspension, which, precipitated either by slackened velocity in the current, or by a decrease in its specific gravity (as at the mouth of a river or elsewhere), forms dangerous shoals and bars, sometimes entirely ruining the harbour. Currents are also apt to undermine obstacles they meet, if formed in loose or clayey soil, by forming eddies at the base which, in such cases, requires to be protected by an apron, or sloping heap of stones or masonry.

Of the chemical action of the sea as regards harbours, much might be written, but it is merely to mention that many stones and mortars decompose on immersion in salt water. Argillaceous stones, among others, and the artificial Portland cement, resist this action; but when painted or galvanised, soon corrodes in sea-water; gun-metal and copper oxidise but very slightly. No two different metals should ever be placed in contact in sea-water, as the galvanic action induced by the salt rapidly destroys them. Wood is naturally very durable under water, but is liable to destruction from the attacks of the teredo navalis and other boring worms. Green-heat and some other foreign woods are exempt from this danger; but as the use of the latter is very expensive, many wooden jetties, in places where the worm is particularly destructive, have to be renewed every few years, ruinously enhancing the expense.

When the site for a proposed harbour is selected, the engineer should first make himself thoroughly acquainted with all the local influences above noticed, bearing upon the particular circumstances of the case. Not many harbours are constructed upon a perfectly straight shore; generally, the engineer's work is to improve an existing inlet. To suit the local requirements of each case, therefore, few sciences have to be more expansive in their rules than those of marine engineering; the extent, form, and direction of piers rest almost entirely upon the individual judgment of the designer. It must be kept in mind that the moles or piers are not only to protect the ships, but to facilitate their manoeuvres at entering and departing, as well as to serve as quays, &c.

The entrance to the harbour requires especial care. It should be so constructed that the reflection of one wave upon the other may impede the advance of its successors, and that those waves which do unavoidably gain admittance may be so broken up as to spend their fury harmlessly. In some harbours, the entrance is long and narrow, between parallel piers; in others, merely a break in the straith wall, occasionally screened by a projecting jetty. In harbours of refuge, island breakwaters—i.e., those unconnected with the land—are found to answer well, giving a clear sweep to the tidal and littoral currents, and not provoking the deposit of silt.

As to the most advantageous form for the piers and breakwaters (see fig. 3), great difference of opinion prevails amongst engineers. When the pier is for deep water, where the depth is such that the wave shall not have acquired its motion of translation, or have begun to break, a vertical wall answers best. Built of course masonry, it has no inequalities of surface for the water to lay hold of, so that, while stopping and throwing back the advancing undulation, it receives little or no direct lateral thrust. At Dover, where building material of the right kind is scarce, and the amount of rubble required for a sloping work would be a great expense, the Admixture Pier, as the breakwater of the harbour of refuge is called, is being constructed almost perpendicularly; and so at Havre (fig. 3) but at Plymouth, Cherbourg, Holyhead, and Portland, the sloping form has been adopted, crowned
in all but the first, by an upright parapet along the top. It is said that the fiercest deep-sea waves rise and fall harmlessly against the vertical

front of the pier at Dover; whilst at Plymouth, during severe storms, similar waves, that under like circumstances would be as harmless, are converted by the long sloping face into breakers, that do much mischief in their furious ascent. On the other hand, where the material is easily procured, it is found less troublesome to tilt in quantities of rubble—to find its own level—from vessels or a timber-staging, than to construct a less extensive but more difficult work under water by means of the diving-bell or coasons. Where the bottom, too, does not naturally offer firm support, the weight must be spread over as large a space as possible, and the sloping plan adopted. In shallow water, the sloping pier would suffer least, but here a wall built vertically costs less than the other, and is almost universally adopted; so that this point, like most others in marine engineering, becomes merely a question of locality.

In 1809, a committee of the House of Lords sat to inquire into the more efficient protection of our coasts by the adoption of some less expensive plan for harbours and breakwaters than that now in use, and chiefly to consider the subject of floating breakwaters. Many plans were proposed, but the opinions of the various scientific men examined were so often diametrically opposed to one another, that little came of the inquiry; the result being that a moderate sum was recommended to be laid out in experiments. The chief difficulty with the floating structures seemed to lie in the moorings, though here the evidence was as conflicting as elsewhere. Considering that a stone breakwater costs from £500 to £1000 per yard, and that the most promising of these schemes only contemplates an expenditure of from £40 to £50 per yard, it will be seen how very desirable a fair trial would be. Besides, harbours thus protected would have no tendency to silt up.

Where the depth of water at low tide is insufficient, it is customary for commercial harbours of importance to comprise two parts—the outer or tidal, and the inner or floating harbour. These communicate by gates open for the admission of vessels only at high tide, and kept closed at other times. By these means, the inner basin remains always full of water, so that large vessels, not built to 'take the ground,' may lie safely along the quays. Sometimes the gates are double, one being placed to keep out the flood while the harbour is empty and cleaning; or treble, forming a lock for the more speedy admission and departure of small vessels able to navigate the outer harbour at half-tide. The length, breadth, &c., of this communication and its gates depend of course upon local circumstances. The inner harbour is surrounded by quays, warehouses, tramways, &c., being, in fact, a floating dock. It is generally connected with a dry or graving dock. See Dock.

Amongst the most important considerations for the maintenance of harbours, are the means adopted for clearing them of accumulations of sand and shingle. Where the deposit is of a sandy or silty character, the most economical plan, generally, is to remove it by dredging; but with shingle or gravel, the sudden rush of pent-up waters from a sluice, is that found efficacious. Although now regarded rather with disfavour, this plan was once extensively adopted, and in certain cases undoubtedly has its advantages; but while the expense of the works, both for construction and maintenance, is very considerable, the results obtained are often far from satisfactory. A basin communicating by sluices with the outer harbour is enclosed, and is periodically filled by holding back the waters, if any, flowing down from the country, by admitting and retaining the high tide, or by a combination of these two plans. At the proper moment, the sluices are opened, when the rush of water removes the alluvion deposited in and at the mouth of the harbour. The sluices should not be more than 900 or 1000 yards from the pier-heads, and the velocity of the water at starting should be at least five or six feet per second; otherwise, the silt might merely be removed from the inside of the harbour, and deposited in a still more objectionable place—across the mouth. Care must be taken that the foundations of the piers, &c., are not undermined by the action of the sluices.

The best, and indeed only great work on harbours, is that of Sir J. Rennie, The Theory and Construction of British and Foreign Harbours. Much practical information on the subject may be

obtained from Weale's Rudimentary Treatise on Civil Engineering; and Smiles's Lives of the Engineers admirably relates the progress of the art.

The internal management of a harbour is usual.
the control of the harbour-master, whose duty it is to superintend the entrance, departure, and arrangement of vessels, taking care they anchor only in proper places, and seeing that the rules and regulations of the port are observed. For the
construction of a harbour, an act of parliament must be procured, approving the plan, and granting power to raise the requisite funds and levy tolls. Harbours of refuge are formed entirely at the
national expense.

As a good example of a purely artificial modern
harbour for commercial purposes, a plan of that at
Ramsgate is appended, which, together with the
sections of piers, &c., above given, will, it is hoped, help to elucidate this somewhat difficult subject
(see fig. 4).

HARBOURS, or PORTS, in Law. In England, as well as Scotland, the right to erect and hold ports and havens is vested in the crown. Nevertheless, this right may legally exist in the subject, provided the latter may prove that he has a charter or grant from the crown, or has exercised command from time immemorial, which necessitates a charter or grant. But even though an individual has a right to a particular port or harbour, he holds it charged with or mortgaged to the right of the public to make use of it. The crown has also the superintending power of opening and shutting ports for the purpose of prohibiting the importation or exportation of goods. It is also a settled maxim that the duties or tolls exacted should be reasonable and moderate. In England, the grantee of a port is presumed to be bound to repair it; but in Scotland, this obligation only extends to compel the owner to apply the dues towards repairs so far as they will go.

In most cases, the powers of the common law have been insufficient to regulate the progressive
wants of the public as regards harbour accommoda
tion; and various acts of parliament have been passed for the purpose of authorising harbours to be constructed, or extended and improved, and for
exacting dues or tolls for the purpose of repaying the
expenses. In 1847, a general Consolidation Act (10 Vict. c. 27) was passed for the United Kingdom, providing a code for the regulation of the pro
cedures and circumstances by which towns and
&c., charged with making and improving harbours, docks, and piers. The duties of such bodies are
there defined in all their details, as well as the mode of collecting the dues or tolls which are empowered to levy. Various local acts are also from time to time passed to meet the pecuniary
wants of localities. The principle of all these acts is, that the commissioners are empowered to make
the works, and, by way of paying for the expense,
levy a small toll on those who use the harbour.

HAMBURG, an old town and rising seaport of
Hanover, in the province of Lüneburg, is situated
four and a half miles south of Hamburg, on the
southmost branch of the Elbe, in a marshy district at the foot of a wooded chain of hills. It is
surrounded with walls, and has a fortified castle.
Sugar-refining and tanning are extensively carried
on, as well as manufactures of woollens, linens, and hosiery. Its transit-trade with Hamburg and the
countries south of the Elbe, which has long been considerable, has recently received a favourable
impetus by the construction of the Hanover and Hamb
erg Railway, and by the deepening and enlarging
of its harbour, which can now accommodate 500
vessels, and admits of the landing of the cargoes at the quays. Hanover, which is a small town, is
Hamburg is carried on by steamers, of which from
four to six arrive and depart daily. H. is a place of
holiday resort for the Hamburger. Pop. 7000.

HARD LABOUR, an addition often made to
the punishment of offences besides mere imprison
ment. This practice is said to have been intro
duced by the statute of 5 Anne, c. 6. It is now
firmly established in the United Kingdom: and by
express statute, the power of adding hard labour to
the punishment of imprisonment, has been given in
most cases, both as to indictable offences and the
more disgraceful offences which are punishable
summarily. The punishment of hard labour is
never made by the rules of the jail or prison, where provision must be made of the proper materials for the purpose.

Picking oakum, working the tread-mill, &c., form
part of this labour; and in general, the number of
hours for such labour, unless in case of sickness, is
ten hours daily.

HARDENBERG, FRIEDRICH VON, better known
by his literary pseudonym of NOVALIS, was the
son of Baron von Hardenberg, and was born at
the family residence in Prussian Saxony in 1772.

His father, then director of the Saxon salt
works, was a man of a religious disposition, and
a member of the Hermuth communion, while his
mother is described as 'a pattern of noble piety
and Christian mildness.' Young H. inherited the
serious and reverential nature of his parents. He
studied at Leipsick and Wittgenstein. After a brief
life, made beautiful by love, friendship, study, and
literary activity, he died of consumption, 19th
March 1801, in the arms of his friend, Friedrich
Schlegel. His chief works are Lehrbüs zu Sais (Disciples at Sais); a Physical Romance, 'con
aining,' says Carlyle, 'no story or indication of
a story, but only poetised philosophical speeches,
and the strangest shadowy allegorical allusions;
Heinrich von Oberdingen, intended, as he himself informs us, to be an 'apotheosis of poetry,' but
which he was not spared to finish; and Hymnen
die Nacht (Hymns to the Night). 'H.' says
Carlyle, 'is the most ideal of idealists.' A pro
found, beautiful, but indefinite aspiration breathes
through all the fragments he has left us. What he
lacks is force, activity, and common-sense vigour
of understanding. H. belonged to the romantic
school of German literature, but he took no part in the controversy; he wrote his most famous

'brief notes,' was he his 'Briefe,' or 'Briefe de
Schrift,' was he his 'Briefe de Schriften' were published in 1802 (5th ed. 1837) by
Tieck and F. Schlegel, the former of whom prefixed a
biography. See Carlyle's Miscellaneous Essays.

HARDENBERG, KARL AUGUST, PRINCE VON,
a Prussian statesman, was born at Essenroda, in
Hanover, May 31, 1756. He was educated at
Leipsick, Göttingen, and Metz, and during 1776
1778, travelled in Germany, France, Holland, and
England. On his return to Hanover, he became
privy-councillor of the exchequer, and was raised to
the rank of count; but a quarrel with the Prince of
Wales, originating in a matter deeply affecting his
honour, induced him, in 1782, to quit the service of
the Hanoverian government. He now repaired to
the court of Brunswick, where the duke appointed
him, in 1787, president of the council of state. He
was also commissioned by his master to convey
the will of Frederick the Great, which had been
deposited in the duke's hands, to the new king,
Frederick William, who received him with marked
distinction. In 1790, the markgraf of Anspach and
Baireuth having requested the Prussian monarch
furnish him with a person competent to administer the
affairs of his dominions, Frederick William
recommended Hardenberg. After Anspach and
Baireuth had been expelled, the markgraf, in 1791,
was appointed a Prussian minister of state, and
a member of the cabinet ministry. At the com
mencement of the war with France, the king
summoned him to his head-quarters at Frankfort-on-the-Maine as administrator of the army. Early in April he proceeded to Basel, and on the 5th April, he concluded a peace between Prussia, and the French Republic. On the accession of Frederick William III. in 1797, H. was recalled to Berlin, and was intrusted with the management of all foreign affairs. In 1804, he was chosen first Prussian minister on the resignation of Haugwitz, and in this capacity endeavoured to preserve neutrality between France and England. But when the French troops attacked Anspach, he changed his policy, and addressed a strong remonstrance to Marshal Duroc. After the victory of Napoleon at Austerlitz, Prussia was compelled to enter into arrangements with Napoleon, H. was deprived of his office, and Haugwitz, who was friendly to the French, returned to power. In 1806, Prussia was again led to declare war, and after the fatal battle of Jena, H. accepted for some time the portfolio of foreign affairs at the desire of the Emperor Alexander. In 1811, he was appointed chancellor of state. Prussia was at this period in a deplorable condition, humbled in the very dust before France; nevertheless, H. was sagacious enough to perceive that the power of Napoleon was on the wane. He laboured primarily to create a national feeling—a patriotic thirst for revenge. The victories of the British troops in the Spanish peninsula, and the disasters that overthrew in ruin Napoleon's vast army in Russia, greatly assisted him in his affairs, and he had the satisfaction of beholding them crowned with success. His exertions were unrewarded; he subscribed to the Peace of Paris, June 1814; and was soon after raised to the rank of prince by his sovereign. He accompanied the allied sovereigns to London, took part in the proceedings of the congress at Vienna, and in the treaties of Paris (1815). In 1817, he reorganised the council of state, of which he was appointed president. He was also present at the congresses of Aix-la-Chapelle, Carlsbad, and Vienna, and drew up the new Prussian system of imposts. During a tour through the north of Italy, he was taken ill at Pavia, and died at Genoa, 20th November 1822. The services rendered by H. to his country were undoubtedly great; to him Prussia is mainly indebted for the improvements in her army system, the abolition of serfdom, of the privileges of the nobles, and of a multitude of trade corporations, bestowed a new and complete reform of her educational system. The MSS. of his memoirs of the period from 1801 to the peace of Tilsit, were sealed up by Frederick William III., who deposited them in the archives of the state, and forbade them to be opened before the year 1850. They have not yet been published.

HARDEWIJK—HARDINGE.

HARDWIJK, a seaport and fishing-town of the Netherlands, in the province of Gueldern, is situated on the eastern shore of the Zuider Zee, 31 miles east of Amsterdam. It was at one time a Hanse town, is fortified after an ancient fashion, and has a spacious harbour, in which vessels engaged in the East India trade are fitted out. Pop. 5700.

HARDICANUTE, king of England, son of Canute the Great by Emma of Normandy, the widow of Ethelred II. At the time of his father's death H. was in Denmark, and the throne of England was usurped by Harold his younger brother, Edmund, who had the authority over Wessex. In this state matters remained for some time, till Alfred, Emma's younger son by Ethelred, invaded the kingdom; but the invaders being annihilated by Earl Godwin, Harold's general, Ethelred was obliged to seek refuge at Bruges, whence she sent to H. to acquaint him with the state of affairs in England. H. being of an easy and self-indulgent disposition, allowed two years to pass before he went tooods. On the 5th April, he concluded a peace between Prussia, and the French Republic. On the accession of Frederick William III. in 1797, H. was recalled to Berlin, and was intrusted with the management of all foreign affairs. In 1804, he was chosen first Prussian minister on the resignation of Haugwitz, and in this capacity endeavoured to preserve neutrality between France and England. But when the French troops attacked Anspach, he changed his policy, and addressed a strong remonstrance to Marshal Duroc. After the victory of Napoleon at Austerlitz, Prussia was compelled to enter into arrangements with Napoleon, H. was deprived of his office, and Haugwitz, who was friendly to the French, returned to power. In 1806, Prussia was again led to declare war, and after the fatal battle of Jena, H. accepted for some time the portfolio of foreign affairs at the desire of the Emperor Alexander. In 1811, he was appointed chancellor of state. Prussia was at this period in a deplorable condition, humbled in the very dust before France; nevertheless, H. was sagacious enough to perceive that the power of Napoleon was on the wane. He laboured primarily to create a national feeling—a patriotic thirst for revenge. The victories of the British troops in the Spanish peninsula, and the disasters that overthrew in ruin Napoleon's vast army in Russia, greatly assisted him in his affairs, and he had the satisfaction of beholding them crowned with success. His exertions were unrewarded; he subscribed to the Peace of Paris, June 1814; and was soon after raised to the rank of prince by his sovereign. He accompanied the allied sovereigns to London, took part in the proceedings of the congress at Vienna, and in the treaties of Paris (1815). In 1817, he reorganised the council of state, of which he was appointed president. He was also present at the congresses of Aix-la-Chapelle, Carlsbad, and Vienna, and drew up the new Prussian system of imposts. During a tour through the north of Italy, he was taken ill at Pavia, and died at Genoa, 20th November 1822. The services rendered by H. to his country were undoubtedly great; to him Prussia is mainly indebted for the improvements in her army system, the abolition of serfdom, of the privileges of the nobles, and of a multitude of trade corporations, bestowed a new and complete reform of her educational system. The MSS. of his memoirs of the period from 1801 to the peace of Tilsit, were sealed up by Frederick William III., who deposited them in the archives of the state, and forbade them to be opened before the year 1850. They have not yet been published.

HARDING, Stephen, the third abbot of the celebrated monastery of Citeaux, and one of the most remarkable religious reformers of the 12th century. Of his parentage and youthful history, little is known beyond the fact that he was of a noble English family, and in early life a soldier. Under one of those religious impulses which so frequently occurred in the middle ages, he undertook a pilgrimage to Rome. He subsequently entered the French monastery of St Claude de Joux, where he was distinguished by his strict and exemplary life, the effect of which was seen in the abbot of Bèze, with a view to the reformation of its discipline, which had become much relaxed. From this monastery he was transferred to that of Citeaux, where, in the death of Alberic in 1109, he was elected abbot. The rigour of observation which he here enforced had such an effect in deterring novices from entering the new order, that at first grave fears were entertained for its stability; but Stephen, placing his trust in the good cause which he had undertaken, persevered in the cause of reform; and he was rewarded, in 1113, by the accession of St Bernard and thirty other youths, whose eminent virtue gave such an impulse to the institute, that in a short time the number of claustrants for admission compelled him to found several new convents, and especially that of Clairvaux, which, under the rule of St Bernard, attained to the very highest distinction in that age. Abbot Stephen continued till his death in 1134, to direct the fortunes of the Cistercian order; and in 1119, he drew up, in conjunction with St Bernard and other members of the brotherhood, the well-known conventions, entitled Carta Cisterciensis, which were approved by Pope Calixtus III., and of which St Bernard, St Hugh, and Eugenius III., and, with some modifications, have continued down to modern times, as the rule of the Cistercian institute. See Mubilion Anual. Benedictin. t. V. p. 205.

HARDINGE, Viscount (Henry Harding), field-marshal and commander-in-chief of the British army, the third son of the Rev. H. Harding, rector of Stanhope, in the county of Durham, was born March 30, 1785, and was gazetted as ensign before he had attained his 15th year. He obtained a brevet rank before his 25th year, and his foreign grade was commuted, shortly afterwards, for British rank, after which he was attached to the Portuguese army from 1809 to 1813, in the capacity of deputy quarter-master-general. When Napoleon effected his memorable return from Elba, H. joined the allied armies in Belgium, and was appointed by the Duke of Wellington commissioner at the Prussian head-quarters. He lost his hand at Ligny, and was thus unable to participate in the crowning victories of Waterford. In 1818 he commanded the horse of the 7th regiment, and in 1820 was appointed to the command of the London garrison; and in 1823, he was appointed to the command of the guards of the garrison of the West Indies. In 1826 he was made a field-marshal; and in 1830 was made a deputy lieutenant of the county of Durham. In 1840 he was appointed to the command of the forces in Ireland; and in 1844, he accepted the high post of governor-general of India, which he
HARDNESS—HARE.

filed until 1847. When the great Sikh war broke out, he hurried to the north-western frontier of India, and served as second in command under Lord Gough during the sanguinary and hard-fought battle of Moodkee, Ferozeshah, and Sobraon. After the peace of 1856, he was rewarded by a viscountcy, the East Indian Company granting him a pension of £5000, and parliament voting him an annuity of £3000, for himself and his next two sons. On the death of the Duke of Wellington in 1852, H. was appointed commander-in-chief of the British army, a distinguished post which he filled during the eventful epoch of the Roman war, and which he only resigned a few months before his death. In October 1855, he was advanced to the rank of field-marshal. He died September 24, 1856, at his seat, South Park, near Tunbridge, Kent.

HARDNESS, Scale of. The hardness of a body is measured by its power of scratching other substances. Variations in the degree of hardness presented by different crystallized bodies furnish a valuable physical sign by which one mineral may be readily distinguished from others closely resembling it.Mohs selected ten well-known minerals, each succeeding one being harder than the preceding one, and thus formed the Mohs Scale of Hardness, which has been generally adopted by subsequent mineralogists. Each mineral in the following table is scratched by the one that follows it, and consequently by all the subsequent ones, and the hardness of any mineral may be determined by reference to the types just selected. Thus, if a body neither scratches nor is scratched by felspar, its hardness is said to be 6; if it should scratch felspar but not quartz, its hardness is between 6 and 7—the degrees of hardness being numbered from 1 to 10.

The figures on the right indicate the number of known minerals of the same or nearly the same degree of hardness as the substance opposite to which they stand:

<table>
<thead>
<tr>
<th>Scale of Hardness of Minerals</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Talc</td>
</tr>
<tr>
<td>2. Clay</td>
</tr>
<tr>
<td>3. Felspar (any cleavable)</td>
</tr>
<tr>
<td>4. Quartz</td>
</tr>
<tr>
<td>5. Limestone</td>
</tr>
<tr>
<td>6. Lepidolite</td>
</tr>
<tr>
<td>7. Rock-salt</td>
</tr>
<tr>
<td>8. Pericline</td>
</tr>
<tr>
<td>9. Gypsum</td>
</tr>
<tr>
<td>10. Diamond</td>
</tr>
</tbody>
</table>

The cause of the varieties of hardness observed in different bodies is not known. The same substance—as, for example, a piece of steel—may, under the influence of different circumstances, be so soft as to take impressions from a die, or may be nearly as hard as a diamond.

HARDWOOD, Jean, was born in 1645 at Quimper, in Brittany, where his father followed the trade of a bookseller. H. received his first education in the schools of the Jesuits, and being received into that order at the age of 20, completed his studies in Paris. On the death of Pere Garnier in 1683, H. was appointed his successor at the College of Grand, in which office he enjoyed full leisure for the literary pursuits in which he delighted, and in which his extravagancies have acquired for him a notoriety almost without any parallel in the annals of literary eccentricity. Duperan places him among the very first scholars of his learned brotherhood. In a spirit of literary skepticism which it is difficult to look upon as serious, he maintained, not only that the entire body of classical literature, with the exception of In Latin, Pliny's Natural History, Virgil's Georgics, the comedies of Plautus, and Horace's Satires, and in Greek, Homer's Iliad, and Herodotus' History, was falsely ascribed to the authors whose various names it bears, but that it was all the production of the monks of the 13th century! To the same sceptical spirit, he rejected as spurious all the reputed remains of ancient art, together with the inscriptions and coins which are attributed to classical times; nay, he extended the same scepticism to the Septuagint version of the Old Testament, and even to the Greek text of the New, the original language of which he held to have been Latin! Opinions so extravagant naturally called forth the reprobation of the authorities of his order. He was required to retract them; and there is some reason to believe, that they were put forward by him rather from a love of paradox and a morbid desire of notoriety, than from any serious conviction of their probability. Nevertheless, with all this extravagance, the erudition of Pere H. was beyond dispute, and most of his works are of great historical and critical value.

His edition of Pliny (5 vols. 4to, Paris, 1689) is a prodigy of learning and industry. Of his remaining works, the most valuable is his great Collectio Concinaturum (12 vols. 8vo, 1727), an enormous body of great learning and utility, which has the rare advantage of preserving one of the best indexes extant; a commentary on the New Testament in folio; several volumes on the study of numismatics and chronology; and a vast number of dissertations and essays: see his Memoire de Trevoux. He died at the age of 83, in the convent of his order in Paris, September 3, 1729.

HARDWARE, a commercial term applied to the commoner articles made of iron, copper, or brass, such as locks, keys, anvilis, graters, shovels, &c. The great hardware manufacturer of this country is Birmingham, Wolverhampton, Walsall, Willenhall, Shiftech, &c. The extent of the trade of these places is enormous; the value of the exports of hardware alone being for the year 1860 not less than £3,000,000. The returns give for hardware, including cutlery, £3772,025. See Iron.

HARDWOOD-TREES are forest-trees of comparatively slow growth, producing compact, hard, and valuable timber, as oak, ash, elm, chestnut, walnut, beech, birch, &c. From these, willows, elms, &c., are distinguished as soft-wooded trees. Neither term is extended to pines, cedars, or other coniferous trees, the wood of which is of a peculiar and very different character.

HARE (Lepus), a genus of rodent quadrupeds, of which there are many species very similar to each other. The Linnean genus Lepus now forms the family Leporidae, which includes the genera Lepus and Lagomys, and of which a peculiar characteristic is the presence of two small incisors immediately behind the ordinary rodent incisors of the upper jaw, so that these teeth seem to be double. The molar-sixes, six on each side above and five below, are transversely grooved, being formed of two vertical plates soldered together. All the animals of this family feed exclusively on vegetable food, and chiefly on herbage, grass, &c., are also shed on grain, roots, and the bark of trees. Their fore-feet have five toes, their hind-feet four; the soles are hairy. Their fur is soft; the colours mostly gray or brown, the alpine and arctic species becoming white in winter. H. Lepus is the hare, which is widely distributed over Europe and the northern and central parts of Asia. The Irish H. (L. Hibernalis) has, however, recently been described as a distinct species. It differs from the common H. in its rounder head, shorter ears, and shorter limbs; also in having the fur composed only of one kind of hair, short and soft, with none of the long black-tipped hairs which are mixed with this in the
HARE—HARLEFLEUR.

common species. The fur, therefore, is of no value. The common H. is not found in Ireland. Notwithstanding the character of timidity usually ascribed to the H., it is really a pugnacious animal, and displays no little courage in encounters with those of its own race, or with animals of nearly equal powers. It has been an object of the chase from a very early period. Xenophon, in his Cynegicus, gives an enthusiastic description of the sport. Concerning the hunting of the H., see Coursing. Being evidently designed to seek safety from enemies by fleetness, the H., however well supplied with food, never becomes fat. It ordinarily lies quiet in its form during the day, and goes in quest of food in the evening and morning. Where, through game preserving, it is abundant, it does no little damage to crops. It is a prolific animal, although not nearly so much so as the rabbit. The female produces from two to five at a birth. The young (leverets) are born covered with hair, and with the eyes open. The VARYING H. or ALPINE H. (L. variabilis), which inhabits the mountains both of the north and south of Europe, and is found on those of Scotland and of Cumberland, is remarkable for the change of colour which it undergoes, without change of hair, on the approach of winter. Ordinary of a bluish-grey colour, it becomes of a shining white, the change beginning with the feet, and extending upwards, terminating with the back. This, which in many places is called the Blue H., is about equal in size to the common H., but has shorter limbs and ears, and is less swift.—In the arctic regions both of the Old and New Worlds, the ARCTIC H. or POLAR H. (L. ghecidis) abounds. It is entirely white in winter, brownish-gray in summer, has long soft fur on the belly, and fine thick fur on the back; is considerably larger than the common H., and spends the whole year without hibernation, even in Melville Island, and similar cold desolate regions; lichens and mosses probably affording it the greater part of its food.—North America produces a number of other species of H., of which some inhabit the swamps of the southern states.—India has a H. (L. ruflcudens) very similar to the common H.; other species are found in other parts of Asia, Egypt, the Cape of Good Hope, &c. The fur of the H. is used for felting for making hats and other purposes.

HARE, in point of English law, is one of the wild animals called Game (q. v.), and is specially protected by the game-laws for the benefit of the owners of land. There is no close season as to hares, which may therefore be lawfully killed by a licensed sportsman all the year round. Being game, hares can only be bought from a licensed dealer, and sold by licensed persons. The owner of enclosed land, and also the tenant, if otherwise entitled by his lease to kill hares, may do so without a license. So those who hunt them with greyhounds or beagles require no license. All others require a license. To kill hares unlawfully by night in a warren, or place kept for breeding hares, is now a misdemeanor by 24 and 25 Vict. c. 17, s. 17; to kill them elsewhere, is only a misdemeanor when the third offence is committed. In Scotland, the law is substantially the same, except that the killing of hares unlawfully by night is only an offence punishable summarily, unless it is a third offence, when it becomes indictable. In Ireland, there is a close season, when hares cannot be killed—viz., between the first Monday in November and the first Monday in July following. See Paterson's Game-laws of the United Kingdom.

HAREBELL, or BLUEBELL (Campanula rotundifolia), the most common of all the British species of Bellflower (see Campanula), growing abundantly in dry and hilly pastures, on waysides, &c.; flowers in summer and autumn. It is common in most parts of Europe, and even to the extreme north. It is everywhere a favourite from its beauty and gracefulness, and is the subject of many allusions in poetry. It is a perennial plant, with a slender stem 6—14 inches high, sometimes bearing only one flower, but more generally a loose panicle of a few drooping flowers, on very slender stalks; the flowers sometimes white, but generally bright blue, bell-shaped, and fully half an inch long. The juice of the flowers yields a fine blue colour, and may be used as ink.

HARE'S-EAR (Bupleurum), a genus of plants of the natural order Umbelifera, having compound umbels of yellow flowers, and generally simple leaves. The leaves of the most common British species, B. rotundifolium, embrace the stem and are roundish oval. This plant, which grows in cornfields in the chalk districts, is the Thorough-wax of the old herbalists, and was once in repute as a vulnerary, but has fallen into disuse. The species of H. are numerous, and are natives of temperate climates in most parts of the world.

HARLEFLEUR (called in the middle ages Hare-foot), a small town of France, in the d'i arrondissement of
HARGREAVES—HARRIET.

Scalonafter, is situated near the mouth of the L Hazel, on the northern bank of the Seine, about four miles east of Le Havre. The chief building is a beautiful Gothic church with an elegant tower, built by the English as a memorial of the victory of Agincourt. Pop. 1500, who are employed in fishing and the rearing of cattle. In former times, before the rise of Havre, H. was a flourishing town, and was the key to the entrance of the Seine. Its harbor now forms a meadow. It was taken by the English under Henry V. in 1415, retaken by the French in 1433; in 1440 it was again seized by the English, and ten years after was recaptured by Charles VII. of France. Off this town the duke of Bedford took or destroyed nearly 500 French ships, August 15, 1416.

HARGREAVES, JAMES, whose name will ever be remembered in connection with the cotton manufacture of this country, as the inventor of the carding-machine, and the spinning-jenny, was an artisan at Stanhill, near Blackburn, where he was born. H. was an illiterate man, and supported himself and family by weaving and spinning, carrying on in his own house, according to the custom of the time. In 1760 he invented the carding-machine, as a substitute for the use of hand-cards; and four years later, he produced the spinning-jenny. H. had tried to spin with two or three spindles at once, holding the several threads between the fingers of his left hand, but the horizontal position of the spindles frustrated his attempt. One of his children, however, is said to have upset the spinning-wheel while he was at work, and as he retained the thread in his hand, the wheel continued revolving horizontally, and the spindle vertically. The observation of these motions produced the thought, that if a number of spindles were placed upright, and side by side, many threads could be spun at once. H. now put his idea into practice, and the result was the jenny, at which he and his family worked, till the large amount of cotton which they spun having excited suspicion, his fellow-spinners, imbued with strong prejudices against machinery, broke into his house, and destroyed his frame. He then removed to Nottingham in 1768, where he erected a spinning-mill. Two years later, he took out a patent for a machine; and discovering that it was in use by manufacturers in Lancashire without his permission, brought an action for £2000 damages. Pending the trial, he was offered a commission by the government; but, instead of the job, the patent was refused, and it having been proved that he had sold some of his machines before the patent was obtained, it was thereby declared to have been invalidated, and his claim for compensation fell to the ground. Thus the inventor was but little benefited by his work. H. continued to carry on business as a yarn manufacturer, in conjunction with a Mr. Jones, with moderate success, till his death in April 1778, when his share in the mill was bought by his partner for £400. His country never gave H. any reward for the invention to which so much of its wealth is due; yet it is but just to the memory of the late Sir Robert Peel to state that one of his last acts as a British minister, was to bestow on the youngest and only surviving daughter of this inventor, the sum of £250 from the Royal Bounty Fund, a somewhat tardy recognition of a great service rendered to the country nearly ninety years before.

HARING, WILHELM, better known under the name of Wilhelm Leibniz and Schultens, was born at Breslau in the year 1798. He was educated in Berlin, and served as a volunteer in the campaign of 1813. He afterwards studied law at Berlin and Breslau, but abandoned this pursuit for a literary career. After several poetical and other literary efforts, H. first made himself known over all Germany and abroad by his romance of Waldstom (2d edit. 1825—1824), written in consequence of a wager with a friend that he would produce a work which should be mistaken for one of Sir Walter Scott's. Walldorn was a most audacious mystification, and was greedily devoured in Germany as a production of the Scottish novelist. It was translated into various languages, among others into English by Thomas de Quincey (London, 1824), and this edition, however, departed so widely from the original, that it hardly deserved the name. H. has likewise written several admirable tales, but his chief excellence is displayed in the field of historical romance. His Cabirien (1823), no less than others, turns up defects, may be regarded as his best work; Roland von Berlin (3 vols. 1840); Der falsche Waldhorn (3 vols. 1842); Hans Jurgen und Hans Jochem (2 vols. 1846); Der Weissel (3 vols. 1848); and Rede der erste Bürgerpflicht (5 vols. 1852), may likewise be classed among the first specimens of the historical romance in the German language.

HARRIET, Abu Mohammed Al Kasim ben Ali, a most celebrated Arabic philologist and poet, born at Bassorah, on the Tigris, in 1446 H. Little is known of his life and circumstances, save that he was the son of a silk-merchant (whence his name Harriri—harrir, silk). H. wrote several valuable grammatical works, and his poetic works form a high order. But the most famous of all his writings, and indeed one of the most famous compositions of all times and countries, is his book entitled Makameke (Sittings). This book may be described as a novel, or a collection of tales, losing strongly together, the centre of which is always a certain Abu Seid from Seraj, who, witty, clever, amiable, of pleasing manners, well read in sacred and profane lore, but cunning, insipid, a thievish scoundrel, always amusing, and always getting money out of his auditors. The brilliancy of imagination and wit displayed in these strange adventures, their striking changes, and dramatic situations, have hardly ever been equalled; but more wonderful still is the poet's power of language. The whole force of the poet's power of expression, spirit, elegance, and grandeur of the Arabic idiom, H. has brought to bear on his subject. His work—of which one of the greatest Arabic authorities has said that it deserved to be written in gold—has indeed become the armoury as well as the mine of all Arabic writers since his day. Poets and historians, grammarians and lexicographers, look upon the Makameke as the highest source of authority, and next to the Kuran, as far as least as language is concerned. His book has been translated either entirely or partially into nearly every Eastern and European tongue, has been the prototype of innumerable imitations, the most successful of which is in the one in Hebrew, Tuckermann, by Jehuda Al-Charisi. The first complete edition of the text appeared in Calcutta, 1809—1814, in 4 vols.; another by Caussin de Perceval, in Paris, 1818; one much more valuable, chiefly on account of its commentary by Silvestre de Sacy, appeared in Paris, 1821—1822 (re-edited 1847—1853).

The first (Latin) translations in European tongues of single Makameks were made by Golnius (1836) by Seutter (1821, &c.). But the (1824) of all translations is due to Rückert, who, with a power only inferior to that of H. himself, has so completely reproduced the spirit and form of the work in German in his Verwandtungen des Abu Seid & b. 241.
GARIOCH.

HARIOCHANDRA. a Hindu king of the solar dynasty, a descendant of Ikshuvak, and one of the most important personages in the legendary history of ancient India. The earliest mention is made of him in the Aitk organise Brahmans (see Véda), where he is the subject of one of the most interesting legends of the Vedic period. He is represented there as desirous of obtaining a son, and of making a compact with the god Varuna, by which he promised to sacrifice to the god his son, if he granted him one. Varuna acceded to his prayer, and the Aitk organise Brahmans then proceeded to relate how H. delayed, from time to time, the fulfilment of his part of the compact, until at last he succeeded in finding a substitute for his son in Sunahsépa, who was sold to him by his father for 100 cows, to be offered in sacrifice to Varuna. Ultimately, however, Sunahsépa becomes released from his bondage through the intervention of the gods. See SUNAHsÉPA. According to the epic poem Mahabháhrata, H. was a type of munificence and piety, and after death became elevated to the court of Indra; some of the Puránas are still more explicit on his wonderful fate. Having given his whole country, his wife and son, and finally himself to Visvamitra, in satisfaction of the demands made by this greedy priest for his assistance at a sacrifice, H. in consequence of this pious act, became elevated with his subjects to the paradise of Indra; but having been insidiously misled by Narakas to boast of his merits, was again precipitated. The repentance of his pride, however, arrested his downward descent, and he and his train passed in mid-air, where his city is popularly believed to be at times still visible.—See Wilson's translation of the Vishnu Purána.

HARIVANSA. A Sanscrit epic of some extent, which professes to be part of the Mahabharata, but may be more properly classed among the Puranas. It is chiefly occupied with the adventures of Vishnu, in his incarnation as Krishna, but treating likewise of the creation of the world, of patriarchal and regal duties, and other matter connected with Puranas. Although it is frequently quoted by later writers, it is not a compilation of much reliability. See PURAÑA.

HARLAW, BATTLE OF. From the beginning of the 12th c. to the beginning of the 14th c., the power and territory of the Celtic tribes in Scotland steadily gave way before the encroachments of the Anglo-Normans of the Lowlands. But during the long Wars of the Succession, and the feeble reigns of the first and second Stuart kings, the Celtic people regained much of what they had lost; but, strengthened by alliances with England, they began to be regarded with alarm by the Scottish government. A trial of strength seemed inevitable, and it was precipitated by a dispute as to the right of succession to the earldom of Ross, between Donald Lord of the Isles and a brother of the Regent Albany. The island chief, gathering a host of 10,000 Islesmen and Highlanders, marched rapidly southwards, leaving havoc and desolation behind him. The royalists, under Abercorn, and the whole country to the north of the Tay, seemed to be within his grasp, when he was encountered by a vastly inferior force of the chivalry and men-at-arms of Mar, Garloch, Buchan, Angus, and Morans, under Alexander Stewart, Earl of Mar, one of the best captains of the day, familiar in his youth with the usages of Highland warfare, and more recently distinguished in the wars of France and Flanders. The armies met at the level junction of the Rivers Don and Ury, at Harlaw, a low table-land on the banks of the Ury, about 18 miles to the north-west of Aberdeen. The battle was long and bloody, but the Highlanders were at last driven back. They left two chiefs, Mungo, Lord of Kintail, and Mungo, Lord of Strathfarrar, and more than 500 men dead upon the field. The loss upon the other side was computed at 500 or 600, among whom were the Constable of Dundee, hereditary bearer of the royal banner, Alexander Irvine of Drum, and other brightly marked of the best esquires of the day, like Mearns, nearly all the gentry of Buchan, and Robert Davidson, the provost, and many of the burghers of Aberdeen. So obstinate and sanguinary was the struggle, and so greatly were the Lowlanders outnumbered, that few of them escaped without a wound. The conflict made a deep and lasting impression on the national mind. For more than a hundred years, the battle of Harlaw continued to be forgotten once again by school-boys in that part of Scotland, and the more than two hundred years, it was remembered in the music of the people. It lived still longer in their traditions; and it is not yet forgotten in their poetry. It is the subject of a still popular ballad, written by Robert Burns, towards the end of the 18th c., printed at least as early as 1688, reprinted in Allan Ramsay's Evergreen in 1724, and included in most subsequent collections of Scottish ballads. Scott, in his Antiquary, has commemorated 'the air field of Harlaw' in a fine fragment of song.

HARLEQUIN, CLOWN, PANTALOON, and COLUMBINE, the four chief personages in the modern Christmas pantome. This species of play is divided into two parts—the one, the introduction, or opening; the other, the harvest. As in both divisions of this kind of play, but particularly the opening, were wont to be acted in dumb-show, and at one time the same performers used to play all through the piece; the idea of which was a story of love, interspersed with grotesque elements. At a certain stage of the plot, a fairy was employed to transform the tyrant and his abettor into Clown and Pantaloon, and the lovers into Harlequin and Columbine. These are all characters of one. The original conception of them was probably gay and sanguinary, out of which they were developed by the fairies with a magic wand, the loss of which renders him helpless, is usually able to thwart all his designs, and protect his mistress. A symbolic meaning may, no doubt, be found at the bottom of such representations, at least in many of their parts; but as, in their modern form, they are a jumble of fragments from older scenic entertainments, anything like a consistent scheme is not to be looked for. As to the characters, the prototypes of the Clown and Harlequin may be traced back to the Roman AttelAnna (q. v.). The arlechino (Fr. arlequina) of the early Italian dramatic entertainments was a satirist and practical jester of a similar type as the English Clown. When Harlequin was advanced, the character gradually became more refined, then was confined to the ballet, and at last disappeared from the regular stage. He still figures in the improvised plays of the Italians. In English pantomimes, the Clown is the prime mover in the 'comic business,' and there are often two, the 'talking' Clown, and the 'tumbling' Clown, who acts chiefly as an acrobat. The Clown is also a never-failing adjunct in circus entertainments. Pantaloon is usually represented as a very sly clown, the
Harlequin Duck—Harmaline and Harmine

but of the Clown, and the aider and abettor of that person's comic villainy. This personage is knocked about and well cuffed by every one; he generally, therefore, wears a stuffed dress, in order to protect himself from accident. Columbine, the lover of Harlequin, has nothing to do all through the piece but to dress well, look pretty, and dance her best. The character of Columbine is usually represented by a well-trained dancer. Harlequin wears a tight dress sewn over with spangles. The persons engaged in these occupations require to be trained to it from infancy. To make a good Clown or Harlequin (in the continental and original sense of the word) requires decided genius; and though the rôle may seem the lowest in the dramatic art, lasting European reputations have been obtained in it, as by the English clown, Grimald, and the famous French Carlin (1713–1785).

Harlequin Duck (Clangula haematocephala), a species of Gannet (q.v.), which receives its name from its variegated markings, chiefly white, gray, and black. It inhabits the arctic regions, where it is found not only on the sea, but on lakes and rivers. It is a rare winter visitor of the British islands. In America, it is pretty plentiful in winter as far south as the Bay of Fundy. Its whole length is about 17 inches.

Harley, Robert, Earl of Oxford and Mortimer, the son of Sir Edward Harley, an active partisan of the parliament during the civil wars, and descended from an illustrious Herefordshire family, was born in London in 1661. H. entered parliament, being returned for the Cornish borough of Tregony, as a Whig; but he soon began to vote and speak against his party; and policy and ambition, rather than choice, made him an anti-dissenter and an ardent Tory. He shortly acquired a great reputation for his knowledge of parliamentary law and practice, a study not much pursued in those days; and in the parliament, which met under the chieftainship of Rochester and Godolphin, in February 1701, he was, by a large majority, elected speaker. H. retained this post, having been twice re-elected, till April 1704, when he became secretary of state. The conviction of H.'s secretary for treasonable correspondence with France caused his master, though entirely exculpated, to resign his office in February 1708. H. remained out of power two years long enough, with the assistance of Mrs Masham, to completely undermine the power of the Whigs. In August 1710, Godolphin was dismissed, and H. was appointed to his post of chancellor of the exchequer, and brought back the Tories. An event occurred in 1711, which raised H. to the acme of popularity. A French priest and spy, who assumed the title of Marquis de Guiscard, being brought before the council on the 8th March, on the charge of treasonable correspondence with France, rushed upon H., and stabbed him with a penknife. His life was said to have been in danger, and recovering, he was congratulated by parliament on his escape, created Earl of Oxford and Mortimer, decorated with the Garter, and in the following May appointed lord-high treasurer of Great Britain. From this point, H.'s course was downwards: he was not a man of business, and was destitute of that indispensable quality for a premier—decision of character. Macaulay had but a mean opinion of H. as a statesman, yet he gives him, as a man, a higher character than could be given to any other politician of the time. The principal act of H.'s administration was the treaty of Utrecht: though England might have obtained better terms, she had nothing to gain from a continuance of the war; and the treaty was at all events, popular. H. ceased to pay court to Lady Masham, and the unscrupulous Bolingbroke succeeded in getting him dismissed on July 27, 1714. Lord Oxford was dismissed on Tuesday; Bolingbroke became premier—and the queen died on Sunday. George I. was proclaimed, and Bolingbroke fled to France, but Oxford remained to meet his fate. He was sent to the Tower, and after two years' imprisonment, brought to trial; the two Houses quarrelled as to the mode of procedure, and the Commons having in anger refused to take any part in the trial, he was acquitted by the Peers, and released. He spent the remainder of his life in retirement—the founder of a collection of books and MSS. which perpetuates his name—and died May 21, 1724.

Harringen (Frisian, Harn), a flourishing seaport of the Netherlands, in the province of West Friesland, at the entrance to the Zwin Zee, about 65 miles north-west of Amsterdam. It stands on the site of a former town that was engulfed in the sea in 1134, and is itself protected from the inroads of the ocean by one of the largest dykes in Holland, which is 40 feet high, and fenced along its base by three rows of piles driven into the ground. It carries on an important trade with Norway and England, butter being one of the principal articles of export. Pop. 90,000, who employ themselves in commerce, salt-refining, sailcloth-manufacturing, brick-making, &c.

Harmaline and Harmine are vegetable bases occurring in the husk of the seeds of the Peganum harmala, or Syrian rue, a plant that grows abundantly in the steppes of Southern Russia, and whose seeds are used in dyeing silk, to which they impart various shades of red. Harmaline (C₂₂H₃₄N₂O₂), when pure, crystallises in colourless prisms; but its salts are yellow, and oxidising agents transform it into a red colouring matter, which combines with acids, forming salts, which constitute the basis of the Harmaline Red of commerce. Harmidine (C₂₂H₃₄N₂O₂) may be obtained by oxidation from harmaline. It crystallises in delicate prisms, and forms colourless salts. The Peganum harmala belongs to the natural order Zygophyllaceae. It is a half-shrubby plant, with smooth linear pinnate or bipinnate leaves, and solitary white flowers. The seeds are said to possess narcotic properties, and the Emperor Solymans is reported to have kept himself intoxicated by them for 240 years.
HARMATTAN—HARMONICS.

eating them. They are used by the Turks as a spice.

HARMATTAN, a dry hot wind, prevalent on the Guinea coast during December, January, and February, blowing from the interior to the Atlantic Ocean. It is generally accompanied by a fog, through which the sun appears of a pale-red colour. It has a hurtful effect on vegetation, and also unpleasantly affects the human body, drying up the eyes, nostrils, and mouth, and even causing the skin to peel off. It, however, has the good effect of checking epidemics, and curing dysentery, fevers, and cutaneous diseases. The harmattan is the same as the Sirocco (q. v.) of Italy.

HARMODIUS AND ARISTOGITON, two Athenians strongly attached to each other, who murdered (514 B.C.) Hipparchus, the younger brother of the 'tyrant' Hippias, on account of an insult offered by him to the sister of Harmodius. They meant to kill Hippias also, with a view to the overthrow of the Pisistratids, but in this they did not succeed. H. was cut down by the bodyguard immediately after the murder of Hipparchus. A. fled, but was afterwards taken and executed. A. was banished from Athens a few years later, H. and A. naturally came to be regarded as patriotic martyrs; and in this light they appear in all subsequent Greek history. They received divine honours from the Athenians, and had statues raised to their memory. A very beautiful drinking-song on this subject has come down to us in the Greek Scholia.

HARMONIC PROPORTION. Three numbers are said to be in harmonic proportion when the first to the second, as the difference between the first and second is to the difference between the second and third, otherwise harmonic proportion is that which subsists between the reciprocals of numbers which are in arithmetical proportion. Thus, 3, 5, 7, &c., being in arithmetical proportion, \( \frac{1}{3}, \frac{1}{5}, \frac{1}{7}, \) &c., are in harmonic proportion. In geometry, a line

\[
\begin{align*}
A & \quad B \\
C & \quad D
\end{align*}
\]

is said to be harmonically divided when two points are taken, one in the line, and the other in the line produced, as C, and D; such that AC : CB :: AD : DB. When the line is thus divided, AD, CD, and BD, are in harmonic proportion. A harmonic progression is a series of numbers in harmonic proportion, as the series formed by the reciprocals of numbers forming an arithmetical series.

HARMONICA, a musical instrument of a fascinating quality of sound, invented by Benjamin Franklin, the sound of which was produced from glass in the shape of a cup, or half globe, which was put into a revolving motion on its centre, while the rim was touched by the finger Franklin, in a letter dated 13th July 1762, to Padre Beccaria, at Turin, mentions the history of his invention. It had already been known that beautiful sounds could be produced by friction of the finger on the rim of an ordinary drinking-glass. An Irishman, named Fuckeridge, was the first who hit on the idea of playing airs on a row of glasses, which he tuned by putting water into each. He performed publicly in London in 1745, and showed his glasses were burned in the great fire in London in 1756. When Franklin finished his invention, he found an excellent performer in a Miss Davis, to whom he made a present of his harmonica. Miss Davis, in 1765, performed on the harmonica in Paris, Vienna, and all the large cities of Germany with great effect. This fascinating instrument found many admirers, but none of them ever succeeded in improving it. The commonest of its notes was from C to F, including all the chromatic semitones. The producing of the sound by the points of the fingers produced such an effect on the nerves of the performer as in some instances to cause fainting fits. All attempts to make the instrument upon the means of keys, either a blackman or metal, ended in failure, as no substance was found to act as a substitute for the human finger, which doubtless imparted an expression to the sound which no dead substance could possess. The harmonica was very rare when performed in a similar instrument by Chladni, Kaufmann, Rieffelsen, and others, which were not eminently successful. Other instruments of so merit or importance took the same name, but had not the melodic or resonating power of the original. The harmonica was somewhat similar to the instrument now known as musical-glasses.

HARMONICA, CHEMICAL. This term is applied to the musical note which is evolved when a long dry tube, open at both ends, is held over a jet of burning hydrogen. A rapid current is produced through the tube, which occasions a thickerlament and is attended by a series of small explosions that succeed each other so rapidly, and at such regular intervals, as to give rise to a musical note, whose pitch and quality vary with the length, thickness, and diameter of the tube. The expansion of this phenomenon, which was discovered by Lampadus, but long remained unaccounted for, is due to Faraday. A curious modification of the experiment is given by Bottger, in the 34th vol. of Poggendorff's Annalen.

HARMONICS, the accessory, or concomitant sounds which are produced by a fundamental musical sound, either naturally, or by a division into aliquot parts. Every musical sound, although to the ordinary ear it appears to be only one sound, will, on close examination, be perceived to consist of a principal or fundamental sound, accompanied by other feeble acute sounds in perfect harmony (see HARMONY). The existence of such accompanying sounds, which are called harmonics, can be best demonstrated by the vibrations of a string stretched between two points, or bridges. Eight feet is a good length for such a string, although 16 feet, or even 32, would be better, from bridge to bridge. A scale or measure, accurately dividing the length of the string into three parts, or into nine parts, from the first place to the other, is placed alongside of it. When a violin-bow is drawn across the string, it vibrates from end to end, and gives out its fundamental sound. Divide the string into halves by slightly touching it with the finger at the mark on the scale, or better, with a stretched thread lightly pressed upon it at that point; when sounded, it will be found to vibrate in two halves, each part vibrating as fast again as the entire string, and producing a sound an octave above the fundamental one, or as 2 to 1. Divide in the same manner at \( \frac{1}{3} \), and the sound produced is the fifth above the last octave, being in the proportion of 3 to 2. It is not necessary to divide the string more than into seven points of the division, for the long side of the string always divides of itself naturally, which can be seen by the eye. The parts where the string seems to rest, are called the nodal points. Divide and diminish the string from 7 to 5, 5 to 4, 4 to 3, and the lowest sound is heard, being to the first octave as 4 to 2. At \( \frac{1}{4} \) the major third above the last octave is found, being as 5 to 4. At \( \frac{1}{5} \) the octave of the former fifth, \( \frac{3}{2} \) to 2. At \( \frac{1}{6} \) to 3; at \( \frac{1}{7} \) again the octave of the lowest; at \( \frac{1}{8} \) the major second, or 9 to 8; and above this, at \( \frac{1}{16} \), \( \frac{1}{14} \), \( \frac{1}{12} \), we find the octaves of the
HARMONICS—HARMONION.

In the artificial division of the octave into a chromatic scale of twelve equal semitones, all the intervals required necessarily be made somewhat imperfect, which is called temperament (see TEMPERAMENT). This must be especially attended to in keyed instruments. Singers, and performers on stringed instruments, are guided by the ear, being free from the fetters of fixed notes, to which keyed instruments are necessarily subject. Even in the natural diatonic scale as produced by the harmonics, it will be found, on analysis, that a certain degree of temperament is required to make the fifths within the octave equal. For example, the fifths from F to C, and from E to B, will be found to be accurately the same as the fifth from C to G—viz., 9/4; which is easily ascertained by reducing their respective numbers to the lowest fraction; thus, F to C is 11/8 = 9/4; from E to B is 11/8 = 9/4; while from D to A, which in practical music must also be treated as a fifth, will be found to be too flat; thus, D to A is 9/4, which cannot be reduced so flat; but when both are brought to the fractions of a common denominator, which is done by multiplying 9/4 by 2 = 21/8, and 9/4 by 27 = 27/8, it is shewn that D to A, in the scale of nature, is flatter than a perfect fifth, in the proportion of 91 to 90; so that without temperament A cannot at the same time be a perfect major sixth to C, as a key-note, and also a perfect fifth to D, the true major second of C.

HARMONION, a musical instrument of modern invention, for which there are many claimants. The principle by which the sounds of the harmonion are produced, is called the free vibrating reed, supposed to have been a modern discovery, but now ascertained to have been known in China long before it was ever heard of in Europe. Its construction is as follows: A narrow rectangular slit being made in a piece of brass-plate of a quarter of an inch in thickness, a thin elastic spring of the same metal, and of nearly the exact breadth of the slit, is fixed at one end by two small rivets to the surface of the plate, close to one end of the slit, being so adjusted as to fill the area of the slit, and that when pressed into it the free end, it may pass inwards without touching the end or the sides of the slit, and when slit to itself shall return back to its position of covering the slit. The spring at the free end is permanently bent a very little outwards. When a current of air is forced through the slit, the spring is put into vibration, and produces a continuous musical sound, acute or grave, according to the rapidity or slowness of the vibrations. This kind of reed is termed 'free,' in contradistinction to the reed of the organ-pipe, the spring or tongue of which entirely covers an oblong slit, in the side of a brass tube closed at one end, and vibrates against the cheeks or outside of the slit, instead of within it. After many attempts, in various countries, to construct a keyed instrument of really a useful kind with the free reed, Debain of Paris produced his invention of the harmonion, which became more or less the model of all the others that have followed. The harmonion occupies comparatively but little space, being only about 3 feet 3 inches high, and 3 feet 9 inches broad; the depth being according to the number of the stops. It has a compass of five octaves of keys from C to C, the key-board being placed on the top, immediately below the lid. Under the key-board is the wind-box, on which the valves for each key; while below the valves, and inside of the wind-box, the different rows of reeds are placed. The sizes of the reeds differ, according to pitch, from about 3 inches long to 1 inch; and the quality of sound is affected and modified by the breadth of the vibrating part of the reed, and the shape of the aperture in the wind-box covered by the valve. The pressure of wind is from a bellows with two feeders, which the player moves alternately with his feet, filling a magazine, similar to the bellows of a small organ. When a key is pressed down, the valve below it opens, and the wind, which has access from the bellows to the wind-box, rushes through the slit of the reed, and produces a sound which continues while the valve is kept open. It is a peculiarity of the free reed that an increase or a diminution of the pressure of wind does not alter the pitch of the sound, but merely increases or diminishes its volume. Advantage is taken of this peculiarity to effect, in the harmonion, a beautifully expressive swell, or diminution in the sound, by gradually increasing or diminishing the pressure of the wind. The vibrations
of the spring being like those of a pendulum, isochronous, remain fixed in rapidity or slowness, according to the length and elasticity of the vibrating slip of metal, and thus regulate the pitch of the sound without reference to the pressure of wind. For the deep bass-notes the spring is heavily loaded at the loose end, to make them vibrate slowly; while in the higher notes they are made thinner at that end. Harmoniums are made of various sizes, and from one row of reeds (or vibrators, as they are now called) consist of a small hammer like that of a pianoforte, which strikes a blow on the vibrator the moment the key is pressed down, and sets it instantly into vibration, thus assisting the action of the wind. Harmoniums may now be had of various sizes and prices, at from £2.5 to £5.50. Valuable chiefly for accompanying psalmody, they suitably take the place of organs in temporary places of public worship, or among the less opulent class of congregations. For domestic use, they are not likely to supersede the pianoforte, but possessing the important advantage of not going out of tune through humidity of atmosphere, they will be found available where pianos cannot properly be kept.

HARMONY (Gr., a joining or fitting of pieces into a whole, in Music, is understood to be the union of sounds which individually appear different, but when heard together, form a collective sound, called a chord (see CHORD); or it may be explained as the melting or flowing together of several sounds into one, without the cessation of either of them, or arising from, the consonant nature of their relative proportions to a fundamental sound. All musical compositions can be reduced to a fundamental harmony of successive chords, which, in their progression, are regulated by the rules of the theory of music. Dissonant, as well as consonant, chords are included as forming harmony, as they are a union of several sounds that have but one fundamental sound, or key-note, in common. The harmony of chords can either be close or spread, which the position or distance of the sounds or intervals from one to another, forming the chords, determines. Close harmony is when the sounds composing each chord are placed so near together, that no sound belonging to the chord could again be interposed between any of those already present. Spread harmony is when the sounds of a chord are placed at a greater distance from each other, so that some of them might be again interposed between the parts of those sounds already present. Close harmony generally takes place in music in which there exists a near relationship among the different parts, as in compositions for four male voices, in which case it becomes unavoidable, and spread harmony impossible. In choruses for mixed voices, and in instrumental compositions, spread harmony is more used, and the intervals of the parts of the choruses are all inverted, which produces what is called double Counterpoint (q.v.). In the inversion of intervals, great care must be taken to avoid a consecutive progression of such intervals as become fifth or fourth; for such intervals, if they never approach nearer a less part than the distance of an octave. Close and spread harmony are often mixed, in order that individual parts may become more melodious and easier to sing, as well as to prevent unpleasant or dissonant sounds, although they, or to avoid an equally faulty monotonous formality of movement.

Although it has been said that every chord, whether consonant or dissonant, forms harmony, it must not be understood that any combination of sounds which one may choose to sound together is harmony. A dissonant chord treated as harmony is always judged of according to the nature of its intervals, and the result of the combination of them, whether it is a perfect consonance or not; and even where it is a dissonance, if the combination be such as to make the parts of the chords in music, and on which the foundation of the whole system of harmony in music is built. From the mathematical proportions and the relations of the accompanying sounds to the fundamental or principal sound from which they all arise (see HARMONIES), it follows that harmony, in its first and natural state, can only be in four parts, and it is then called perfect, or complete; in opposition to harmony of two or three parts which cannot be complete, as some of the intervals of the chords, essential to characterise the key or scale, may be wanting. A four-part harmony may be so arranged that five, or even more parts may appear, by means of doubling one or more of the parts of the octave. From this increasing of the parts arises what is called the subordinate harmony, accompanied by the principal or fundamental. In order to avoid faulty progressions in the subordinate harmony, the music must be taken to strictly observe the rules which apply to the intervals in their fundamental state. The purpose of the subordinate harmony is only that of ornamenting the original, which the Germans call Figurban, commonly called figured harmony, but should be more properly called figured counterpoint. If it be admitted that the intervals and chords that are most consonant are also most harmonic, it naturally follows that the union of them must be the most perfect, therefore the order of perfection in which they rank is fixed by their mathematical proportions in relation to the fundamental sound or unison. The common chord of a third, fifth, and octave to a bass note is the most perfect harmony of all which follow the chord of the seventh, and the chord of the ninth. The inversions of any of these chords are all in various degrees less perfect than their original fundamental harmony. The position of the intervals in respect to the fundamental note is also an element in the purity of the chords; as, for example, a chord of the seventh in close harmony, is far less satisfactory and pleasing than it is in spread harmony, where
the different intervals are at, or near, their natural
distances from the fundamental note. Such con
siderations are of great importance to the musician
who has to accompany a figured bass; and also to
the performance of the heavenly system of music in
mature-steps. Harmony, in modern music, is there
fore a succession of chords according to certain
laws. In the early ages of the science, the laws of harmony
were most arbitrary. Nature presents us with sol
colored chords, but also does not preclude the pos
sibility of other, as the intervals, in columns,
Oreek and Jerome, the Gospels, the Ten
commandments, etc. These produced a deep
Harmony throughout Germany, and brought him a
call to be bishop of the Catholic
Church in Nuremberg, to
H. refused. In 1835, he
was made chief pastor
and provost in Kiel, but was compelled to resign,
the rest of his life was spent in retirement,
from one subject or incidental collected for the purpose of con
and of mutual illustration. The title under
which the earliest compilation of this nature,
which was the second hand and was known as Duetsarum, be
cause it consisted of extracts from the four Evangelists. The author of
this compilation was the heretic Tatsian, and it is
remarkable that, in order to give a colour to his
own peculiar opinions as to the unri
cle of the soul of our Lord, he omitted from his collection
the entire history of the birth and childhood of
Jesus as related by Matthew and Mark (Euseb. Hist. iv. 29). St Jerome states that a similar
Harmony was compiled about the same time by
Theophilus of Antioch, although no trace of such
a work is now discoverable; but in the middle of
the following century the celebrated Neo-platonist
congregated a large number of the choral works of
Dauersarum, which formed the basis of the well-known
Tea Indeez or canons, of the Harmony of the Gospels,
the Greek text, by Eusebius, which were afterwards adapted to the Latin text by St Jerome, and continued to be used as a key to the
concordance of the gospels by readers both of the
Greek and of the Latin text, down to the 16th
century. The canons of Eusebius consist of ten
tables. Of these, the first, which contains four
columns, exhibits all the passages which are com
mon to the four gospels; the second, third, and
fourth contain three columns, and shew the passages
which are found in any three of the gospels;
the fifth, sixth, seventh, eighth, and ninth are in
two columns, and shew the passages which occur
in any two of the gospels; and the tenth contains
the passages which are found only in one of the
gospel narratives. The convenience and utility of
such a scheme is at once apparent, and it has
led in later times to the numerous and useful com
pilations, Roman Catholic as well as Protestant,
known under the name of Synopse of the Gospels,
the best and most popular of which are enumerated by
Tucher in the introduction to his own
Synopse Evangelic, p. 9, and foll.

HARMS THE GOSPELS. Many of
the ancients supposed the motions of the stars and
planets to produce a kind of music, which they
called the harmony of the spheres. They attributed
this music to the various proportionate impressions
on the heavenly bodies by one another acting at
proper intervals. Kepler wrote a work on the
harmonies of the world, and particularly of the
celestial bodies.

HAARMS. CLAYTON, a distinguished German
divine, was born 25th May 1775, at Hartzburg, in the
Ditmarsh. In 1797 he went to the gymnasium
at Meckorf, and in 1799 to the university of Kiel. The rationalism of the time, in which he had
been to some extent educated, failed to give him
satisfaction; and Schleiermacher's 'Bekenntnisse über die
Religion at last settled his faith. After supporting
himself as family tutor from 1802 till 1806, he was
appointed Dean of Lunden, in Northern Ditmarsh,
whence he was called, in 1816, to Kiel, as arch
decan and afternoon preacher in the Nicolai-Kirche.
Next year, shortly before the tricentenary of the
Reformation in Germany, he issued, in defence of
Protestant orthodoxy, 60 theses under the title,
Das mind die Thier on Streisitze Dr Luther's.
Theese produced a deep impression throughout
Germany, and brought him a call to be bishop of the
Consortia about to be instituted for the Protestant
Church of Russia. This, as well as a call in
1834 to succeed Schleiermacher in the chair of
Theology, in Halle, in the same year, H.
refused. In 1835, he was made chief pastor
and provost in Kiel, but was compelled to resign,
in consequence of an attack of almost entire
blindness. The rest of his life was spent in retirement,
and devoted to literary activity. He died 1st February 1855.
H.'s published works are chiefly sermons, which may
be reckoned among the best specimens of modern
pulpit eloquence in Germany. Of these, the most
famous are his Winterpostille (1808, 6te Aufl. 1846)
and Sommerpostille (1815, 6te Aufl. 1846), to which
a new series was added—Neue Winterpostille (1826)
and Neue Sommerpostille (1827).—On H.'s life may
be consulted Dorner's 'Bitter der Erinnerung an
das Jubilium von H.' (1842), and H.'s Lebens
brechung, verfasst von ihm selbst (1851).

HARRO, a small town of Spain, in the province
of Logroño, and 26 miles west north-west of the
town of that name, is prettily situated in a fertile
plain on the right bank of the Ebro. It has manufactures
of leather, and the wine which is
grown in the neighbourhood. Pop. 6000.

HAROLD I. (1035—1040), (surnamed Harfoot,
probably on account of his swiftness in running),
was the younger of Canute's two sons, by his first
wife Algyvia. According to agreement on Canute's
second marriage, his son by Emma was to inherit
the English as well as the Danish throne: this son,
Hardicanute, was, however, in Denmark at the time
of his father's death, and being very unpopular
with the Danish part of the population in England,
lost half of his kingdom. Leofric, Earl of Mercia,
led the cause of H., while the powerful Earl Godwin
espoused that of Hardicanute. Civil war was
happily averted by a compromise, and the kingdom
was divided. H. took London, with all the provinces
north of the Thames; while the possession of
the south was given up to Emma for Hardicanute,
who fixed her residence at Winchester, and established
her authority over her son's share of the kingdom.
In 1037, the Thanes and people of Wessex submitted
H., and he was crowned king of all England,
though it is stated that the Archbishop of Canter
bury, Egnoth, at first refused to perform the
ceremony himself, or to allow any of his brethern
bishops to do so. He died at Oxford, March 17, 1040.

HAROLD II. was the second son of the powerful

Digitized by Google
Godwin, Earl of Kent, and was born at the close of the 11th century. On the death of Edward the Confessor, the Witenagemote (q. v.), in the exercise of its rights, set aside the claims of Edgar Atheling, and, ignoring the reputed bequest of the late sovereign, in favour of the Duke of Normandy, elected H. William, Duke of Normandy, being 14 years of age, William immediately asserted his claim, which was supported by H.'s brother Tostig and Harold Hardrade, king of Norway, for the sake of obtaining the duke's assistance to reanimate the former in the government of Northumbria. Tostig and the king landed on the coast of Yorkshire, and after defeating Morcar and Edwin, Earls of Northumbria and Mercia, advanced to York, but were met by H. at Stamfordbridge, and totally routed. Three weeks afterwards, William landed in England; the contending armies met at Senlac, about nine miles from Hastings, where H.'s death (October 14, 1066) made the Duke of Normandy undisputed ruler of England.

Haroueris, the elder Horus, son of Set, the Egyptian Saturn, and Nut, or Rhea, said to have been born on the second day of the month of Tyan. He was the brother, and not the son, of Osiris, from whom he is to be distinguished. In the inscriptions, he is said to be the son of Atum, of Ptah or Vulcan, and Athor or Venus, according to different legends. He is considered the son of Seth and Nutia, and particularly ruler over the heavens, illuminating the world with the brightness of his eye. As such, he was identified with the sun and Apollo, and represented as hawkip-headed, wearing the crown of the upper and lower world. His name is also found in the Greek dedications to him of the temples of Ombos and Apollinopolis Parva. His connection with the sun is, however, undoubted, as he is made on one inscription a child of the sun, and type of Mento Ra or Mars. "The festival of his eyes, which mythically represented the sun and moon, took place on the 30th Epiph."—Birch, Gallery of Antiquities, i. p. 36; Wilkinson, Manners and Customs, iv. p. 399.

Harp, a musical stringed instrument, much esteemed by the ancients. In Egypt, the figure of the harp is found delineated from the earliest ages in many different forms, some of them very simple, and others with great taste and ornament; some played on while standing, others while kneeling. The Celtic bands held the harp in the greatest honour. In the Highlands of Scotland the instrument has disappeared, but it is still in use in Wales, and to some extent it lingers in Ireland, where, from its former prevalence, it is adopted as a national symbol. The old Franks and Germans punished those severely who injured a harpist in the hand. The harp was used as an accompaniment to the psalms sung by the early congregations of Christians. There are three kinds of harps now known—the ordinary Italian harp, which is strong with two rows of wire-strings, separated by a double sounding-board; this kind is now little used, being very imperfect. The double harp, or, as it is also called, Davul's harp, is a more usual instrument, and is made of a treble with a sounding-board and gut-strings; it is always tuned in the principal key of the music, while the strings are altered to suit any modulations out of the key, by pressure on the thumb, or striking the tuning-pin of certain notes. These defects led gradually to the invention of the pedal harp, which has seven pedals, by which each note of the diatonic scale, in all the different octaves, can be made a semitone higher. The cost of the pedal harp is from contra F to D of the sixth octave above. In order to have the B flat, it must be tuned in the key of E flat. The music for the harp is written in the key of E; and this is not the case with the harp at length reached a degree of perfection by the invention of the double-action pedal harp by Erard in Paris, which scarcely leaves anything more to be desired. By means of Erard's invention, each string can be sharpened twice, each time a semitone; so that the C string may be C flats, its full length, C natural by the first movement of the pedal, and C sharp by the next movement. The double-action harp is tuned with all the pedals half-down, and in the key of C natural.

Harpe, Jean François de la, was born at Paris, November 20, 1739, studied at the Collège d'Harcourt, and led for some time a rather chequered life. In 1762 he published a volume of juvenile poems, and in the following year his tragedy of "Hercules" appeared, with considerable success on the stage, and placed to his account both fame and money. Excepting the "Lycée", this is by far the best of his works, though the writing has but little merit, yet it has admirably characterized the play as 'l'oeuvre d'un homme de soixante ans'. La H.'s three subsequent plays, written in the same vein, Timidole, Pharemond, and Gustave Wasa, entirely failed. The work that preserved his name, and has given him a permanent position among the litterati of France, is his "Lycée, ou Cours de Littérature", which, in default of a better, has till lately been their only reliable work of haute critique. That portion which relates to ancient literature is of little value, and that in which the author treats of contemporary writers is entirely worthless, owing to the bitterness and pride of the critic, who could see nothing great or good in the works of a rival or fellow-labourer. The intervening portion is, however, of great value to the student, giving, for the time, a complete critical history of French literature. The book will also be found serviceable to the student of the language. At its commencement, the Reader will find no more earnest admirer than La H.; but when he was cast into prison—where he is said to have been converted to Christianity by a fellow-captive, the Bishop of St Brieux—for refusing to countenance the Jesuits, which democracy and his views entirely changed, and he became a firm supporter of church and crown. La H. died February 11, 1803.

Harper's Ferry, a village in Virginia, North America, at the confluence of the Shenandoah with the Potomac, where the latter passes through the Blue Ridge of the Alleghanies, 53 miles northwest from Washington. Its fine scenery has been celebrated by Jefferson in his Notes on Virginia. The Baltimore and Ohio Railway here crosses the Potomac. It is the site of a government foundry, armoury, and arsenal, which were destroyed and abandoned by the United States troops at the beginning of the civil war; and has since witnessed various struggles. It was also the scene of John Brown's abolition raid in Virginia, 1859, and later in 1860.

Harroocrates, the name given by Greek writers to the younger Horus, the hieroglyphical inscriptions calling him Har or pa khrut, 'Horus the child,' the son of Isis. See Horus. According to the legend, he was a younger son of Osiris and Isis, who was supposed to be the harbinger of the birth to him at the winter solstice. He is described by Plutarch as lame in the lower limbs when born,
HARPOON—HARPY

to indicate the weak and tender shootings of corn. He is represented as a child wearing the skull-cap or paques, the crown of the upper and lower world, and holding in his hands the whip and crook, to expel evil influences. At the right side of his head his hair is gathered into a single lock, and his finger is placed on his mouth, an action indicative of youth, and noted by the Greek and Roman writers for that of silence, in which they made H. the divinity. Sometimes he wears an amulet in shape of a vase round his neck. The temple at Edon or Apollinopolis Magna was dedicated to him, and in the sculptures he symbolises the sun in the earliest hours of the day. He has generally been considered to be the winter sun, but rather represents the feeble and nascent sun of the later mythology. Lions were placed under his throne; cynocephali are said to be dedicated to him, probably from confounding him with the lunar god Khons; and the lettuce, on which he is often depicted sitting, and which was thought to open at sunrise and close at sunset, was particularly sacred to him. So was the Person, or Canina Fideatur. His worship was introduced as part of the Isiac cult into Rome, and he was supposed to be very efficacious in giving dreams; an edict of the people being, however, erected against it in the consulship of Gabinius. In the consulship of Piso and Gabinius, his worship was driven from the Capitol; but he was very popular in the days of Pliny. Although the name of H. is not mentioned earlier than Fratosthenes, yet as he mentions it as part of that of an ancient monarch, it was undoubtedly of high antiquity.

HARPOON, the weapon with which whales and other large cetaceans are killed. See WHALE.

HARP-SHELL (Harpa), a genus of gasteropodous molluscs of the whelk family (Busyconidae), having the last whorl of the shell very large, the shell ribbed longitudinally, the foot of the animal very large. The species, which are not very numerous, are found in the seas of warm climates, and particularly at the Mauritius. The shells are much prized for their great beauty, but must be kept in drawers, and not exposed to light, or their delicate and brilliant colours will fade.

HAIRPSICHORD, a keyed musical instrument, formerly in extensive use, but now little known. In shape it was exactly like a grand pianoforte, to which its internal arrangements were also similar. The sound from the strings was produced by a small piece of crow-quill, or a piece of hard leather, which projected out of a slip of wood, called the jack, that stood upright between the strings, and was pushed upwards by the key, till the quill, or leather,witched the string, causing a brilliant, but somewhat harsh sound; it entirely depends on any means of modification, in respect to loudness or softness.

Specimens of the harpsichord, although now becoming more rare, are still to be found in good preservation, but rather as articles of vertu or curiosity than as useful musical instruments. Many Italian and Dutch harpsichords were highly ornamented by the most eminent artists with valuable oil-paintings on the inside of the lid. The date of the invention of the harpsichord is uncertain. Before the 15th c., there is no trace of its existence. It was introduced into England early in the 17th century. In the 18th c., Kirkman, and later, Broadwood and Schufl, were the famous makers in London. After the invention of the pianoforte, the harpsichord and all instruments of the same kind, such as the spinet, were in time entirely superseded. See PIANOFORTE.

HARPY, a fabulous creature in Greek mythology, considered as a minister of the vengeance of the gods. Various accounts are given of the numbers and parentage of the Harpies. Homer mentions but one, Hesiod enumerates two—Adelto and Okypete, daughters of Thaumas by the Oceanid Electra, fair-haired and winged maidsen, very swift of flight. Three are sometimes recognised by later writers, who call them variously daughters of Poseidon or of Typhon, and describe them as hideous monsters with wings, of fierce and loathsome aspect, with their faces pale with hunger, living in an atmosphere of filth and stench, and contaminating everything that they approached. The most celebrated tradition regarding the Harpies is connected with the blind Phineus, whose meals they carried off as soon as they were spread for him; a plague from which he was delivered by the Argonauts, on his engaging to join in their quest. The Boreads Zetes and Calais attacked the Harpies, but spared their lives on their promising to cease from molesting Phineus.—A harpy in heraldry is represented as a vulture, with the head and breast of a woman.

Harp-shelf.

Harp Eagle (Harpasia destructor):
From a specimen in the Royal Zoological Gardens, Regent's Park, 1851.

The name H. has also been given in modern times to some of the Falconida, as the Marsh 231
Harrier (see Harrier) of Europe, and the H. or H. Eagle of South America (Harpyia destructor or Thraustes harpyias), an inhabitant of the great tropical forests, where it preys chiefly on quadrupeds, and to a large extent on sloths and young deer. Of all birds, it has the most terrific beak and talons. It is larger than the common eagle; is short-winged and short-legged; the upper mandible greatly hooked; the feathers of the head capable of being erected into a great ruff and crest. It has not so elegant a form as the true eagles, but is probably equal to any of them in strength and courage. When adult, it is generally of a blackish slate colour, with gray head, and white breast and belly. It makes its nest in trees.

Harrieger. See Arquibus.

Ha'rrier, a variety of dog used for hare-hunting, whence its name; probably of the same origin with the Foxhound (q. v.)—from which it differs chiefly in its smaller size—or perhaps partly derived from the beagle. It does not exceed 18 inches in height at the shoulder, but otherwise greatly resembles the foxhound, even in colours. It is not so swift as the foxhound. Its scent, however, is extremely keen, which enables it to follow all the doublings of the hare.

Persons hunting with harriers are exempt from taking out a game licence. See Hare.

Harrier (Circus), a genus of Falconidae, allied to Buzzards (q. v.), but differing from them in the more slender form of the body, longer and more slender legs, longer wings and tail, and in having the feathers around the eyes placed in a radiating manner, somewhat as in owls, a peculiar arrangement enabling them from the ground to look behind them to the right and left, like Falconidae. They are remarkable for their low flight, skimming along the ground in pursuit of small quadrupeds, reptiles, &c. The Marsh H. (C. aeruginosus), also called the Moor Buzzard, and sometimes the Harry and the Duck Hawk, is the largest British species, being about 21–23 inches long. The head of the adult male is yellowish white.—The Hen H. (C. cyaneneus) is 18 or 20 inches long, the adult male of an almost uniform gray colour, the female brown. The female is known as the Ringtail, from a rust-coloured ring formed by the tips of the tail-feathers. The Hen H. derives its name from its frequent depredations in poultry-yards. The male of the Hen H. is called the Blue Hen in Scotland.

Harri-ka-r (Happy Despatch), the term applied by the Chinese to official suicides in Japan. According to Dr Macgowan, the Japanese estimate the number of these suicides at 500 per annum, exclusive of suicides by hanging or drowning. All military men and persons holding civil offices under the government, are bound, when they have committed any offence, to rip themselves up, which they do by two gashes, in the form of a cross; but not until they have received an order from the court to that effect; for, if they were to anticipate this order, their heirs would run the risk of being deprived of their place and property. Not unfrequently, upon the death of superiors or masters, the same operation is self-inflicted by those who desire to exhibit devotion and attachment; sometimes also, in consequence of a disgrace or affront, it is resorted to, when no other resource presents.

Harrington, James, an English political writer, was born in Northamptonshire, of a good family, in 1611, studied at Oxford under the celebrated Chillingworth, and, at the termination of his university career, proceeded to visit the continent. His travels embraced the Netherlands, Germany, Denmark, France, and Italy. On the breaking out of the civil war, he took part with the parliament, and in 1646 was appointed by the parliament commissioners one of the personal attendants of the monarch. After the execution of Charles, he withdrew from public notice, and devoted himself to the elaboration and completion of his political system. The result was his famous Ocean, a kind of political romance, on the plan of Plato's Atlantis. The work was first published in 1656, and was dedicated to Cromwell, who read it, but was not over-well pleased with its strait-laced and somewhat finical republicanism, and its animadversions upon usurpation. 'The gentleman must not think,' the Protector is reported to have said, 'to cheat me of my power and authority; for what I have won by the sword, I will not suffer myself to be scribbled out of.' Hume allows it to be 'a work of genius and invention,' and Dugald Stewart calls it 'one of the best of English literature.' Hallam's verdict is less favourable; he pronounces the author to be in general 'precious, dull, and pedantic'; yet he adds that he 'sometimes redeems himself by just observations.' After the publication of Ocean, H. continued to exert himself in diffusing his republican opinions, founded a club called the 'Rota,' fell under suspicion after the Restoration, and was imprisoned, but afterwards released. Meanwhile, however, an attack of insanity had supervened, from which he never perfectly recovered. He died at Westminster, September 11, 1677. An edition of his writings
HARRIS—HARROW.

published by Toland in 1700, and a more complete one by Dr Birch in 1737. The best edition is probably that by Hollis (with Toland's Life), in 1771.

HARRIS, James, an English philologist and logician, the eldest son of James Harris, Esq., of Cose, Salisbury, was born July 20, 1705. His mother was Lady Elizabeth, daughter of Sir John Cotton, first Lord Shaftesbury, author of the Characteristics. He was educated at Salisbury, and Wadham College, Oxford, and entered upon the study of law; but his father having died in 1734, leaving him a handsome fortune, he abandoned the pursuit of his profession, and gave his whole time for a period of fourteen years, to the study of his favourite Greek and Latin authors. In 1745 he married a daughter of John Clarke, Esq., of Sandiford, near Bridgewater, by whom he had five children, the eldest of whom, his only son, became the first Earl of Malmesbury. In 1761, he was returned to parliament for Christchurch, which seat he retained until his death. In 1762, he was appointed a Lord of the Admiralty, and the next year, Lord of the Treasury, and in 1774, Secretary and Comptroller to the queen. He died in 1780. He is chiefly known as the author of Herma, or a Philosophical Inquiry (1780), consists of a series of criticisms and comments on the principal ancient, medieval, and modern authors. His works, with Life by his son, the Earl of Malmesbury, were published at London in 1801.

HARRIS, or HERRIS, a district or parish of Scotland, in the Hebrides, comprises the southern portion of the island of Lewis and a number of adjacent islets. See Lewis.

HARRISBURG, the capital of Pennsylvania, United States, America, is situated in the midst of magnificent scenery on the left bank of the Susquehanna River, 95 miles west-north-west of Philadelphia, lat. 40° 16' N., long. 76° 30' W. It has a handsome street-house, a court-house, jail, state arsenals, state lunatic asylum, numerous churches, several academies, eight or ten newspaper-offices, a railway bridge, 2876 feet in length, and seven diverging railways. It was settled in 1743 by John Harris, an Englishman, under a grant from the Penns, the original European settlers of Pennsylvania. Pop. in 1860, 13,406.

HARRISON, John, a celebrated mechanician, was born at Fauqby, near Pontefract, Yorkshire, in 1693. His mechanical genius, which early displayed itself, led him to study the construction of clocks and watches, with a view to diminishing as much as possible their errors and irregularities, and by 1726 he had effected considerable improvements in their structure. In 1714, the government had offered prize of £10,000, later £20,000, for the discovery of a method for determining the longitude within 60, 40, or 30 miles respectively. After repeated attempts, H. constructed a chronometer, which, in a voyage to Jamaica in 1761—1762, was found to determine the longitude within 18 miles; he therefore claimed the reward of £20,000, which, after a delay caused by another voyage to Jamaica, and further trials, was awarded to him in 1765— £10,000 to be paid on H.'s explaining the principle of construction of his chronometer, and £10,000 whenever it was ascertained that the instrument could be made by others. The success of H.'s chronometer is owing to his application of the compausation curve, in which he laid it in a horizontal plane, and in the same principle he invented the gridiron pendulum for clocks. These, along with his other inventions, the going fusee and the remountor escapement, were considered to be the most remarkable improvements in the manufacture of watches of the last century (see HOLOMOY). H. died in Red Lion Square, London, in 1776.

HARRISON, William Henry, ninth president of the United States, was born at Berkeley, in Virginia, not far from Richmond, in 1773. He served in the capacities of General Wayne in the war against the Indians which terminated in 1795. In 1801, he was appointed governor of the territory of Indiana, which responsible position he held more than ten years. In 1811, in the hard-fought battle of Tippecanoe, he defeated the Indians under the command of the famous Tecumseh. After General Hull's surrender in 1812, H. was appointed to the command of the army on the north-western frontier, with the rank of brigadier-general; he was made a major-general in March 1813. In 1814, he took his seat in the senate of the United States, and soon after was chosen chairman of the military committee. He was nominated in 1836 candidate for the presidency, by the party opposed to Mr Van Buren, and although defeated in the election of 1836, became again the nominee of the Whig party in 1840; and in the subsequent election was chosen president by an overwhelming majority, John Tyler of Virginia being associated with him as vice-president. H. was inaugurated at Washington on March 4, 1841; but he died before a month had elapsed; and according to a provision of the constitution, Mr Tyler became president for the unexpired portion of the term of four years.

HARROGATE, HARROWGATE, or HIGH HARROGATE, a village in Yorkshire, 20 miles west of York city, is celebrated for sulphurous and chalybeate springs. The sulphurous springs are also saline, and of laxative and diuretic quality, while the chalybeate waters are tonic. H. is a very agreeable residence, the surrounding country being full of beauty and interest; it is largely frequented by visitors in summer, and is now easily accessible by the railway from Leeds to Doncaster. The waters are of considerable activity and may be taken under medical advice. They are used both externally and internally, and are in great repute in many diseases of the skin, and in some cases of dyspeptic disorders, scrofula, gout, &c. Harrogate springs were discovered in 1571. A local report on their virtues, with analyses in detail, by Professor Hoffman, was published in 1854. Pop. of township, about 4000.

HARROW, an agricultural implement, used for smoothing and pulverising ploughed land, and for covering the seeds previously sown. It consists of a frame of a square or rhombic form, in which are fixed rows of teeth, or tines, projecting downwards. The harrow is a very ancient implement, having been in use beyond the dawn of history; in early times only the lighter soils were cultivated, it often consisted of bushes, or branches of trees, which merely scratched the ground. Subsequently, we find a wooden frame and wooden tines in use; next, the wooden frame with iron tines; then the instrument very much used at the present day, and especially in favour for light soils. For heavy soils, the harrow constructed wholly of iron is most used, as it is heavier and does more execution; and
of this sort the zigzag form made by Mr Howard of Bedford is preferred. The Howard harrow has the times so arranged that no one follows in the track of another, but each has a separate line of action, which greatly diminishes the risk of any

portion of the surface escaping pulverization. A 'brake' is a large harrow used for breaking down rough or hard land. The 'chain-harrow,' which is a congeries of iron rings, is useful for covering grass-seeds, and especially for separating weeds from the earth or clods in which they are enveloped.

HARROW-ON-THE-HILL, a village of Middlesex, England, is finely situated on the summit of a small eminence about twelve miles north-west of London, on the London and Birmingham Railway. Pop. about 5000. The village derives its celebrity solely from the grammar-school founded here, in 1571, by John Lyon, a wealthy yeoman of the parish. The school was originally intended to afford a gratuitous education to poor boys belonging to the parish, and is still nominally free to all the boys of the parish, but, as in many other cases, it has been diverted from its primary purpose, and is now chiefly attended by the sons of the nobility and gentry, and possesses a very high reputation. It has several exhibitions to Oxford and Cambridge. Among the eminent men who have been educated at H., may be mentioned Sir William Jones, Dr Parr, Lord Byron, George Canning, and Sir Robert Peel.

HARRY, BLIND, a Scottish minister of the 15th century. Scarcely anything is known of his life beyond what is told by Dr John Major (or Mair) in his History of Scotland, published in 1521. 'When I was a child,' he says, 'Henry, a man blind from his birth, who lived by telling tales before princes and peers, wrote a whole book of William Wallace, weaving the common stories (which I, for one, only partly believe) into vernacular poetry, in which he was skilled.' In 1490–1492, Blind Harry is found at the court of King James IV., receiving occasional gratuitues of five, nine, and eighteen shillings. The poem attributed to him, The Life of that Noble Champion of Scotland, Sir William Wallace, Knight, was completed before the end of the year 1488, when it was copied by John Ramsay. This copy, the oldest MS. of the work now known to exist, does not ascribe it to Blind Harry, nor is his name given to it in the earlier printed editions. The poem, which contains 11,861 lines, of ten syllables each, is written in rhyming couplets. The language is frequently obscure, and sometimes unintelligible, but the work as a whole is written with vigour; in some passages, it kindles into poetry; and it is altogether a surprising performance, if we receive it as the composition of one who was born blind. The author seems to have been familiar with the

metrical romances which were the popular literature of the time, and he makes repeated appeals to two Latin lives of Wallace, one by his schoolfellow, Master John Blair, another by Sir Thomas Gray, parson of Liberton. But the poem has no claim to be regarded a history; it is full of gross mistakes or erroneous representations of facts known to every one, and it can only be looked upon as an embodiment of the wild and sanguinary legends which two centuries had gathered round the name of the martyred hero of a fierce struggle for national life. The work is believed to have been printed in the Scottish capital as early as 1529, but no perfect copy is known to be preserved of any earlier edition than that of Edinburgh in 1570, bearing the title of The Actis and Deidis of the Maist Issuer and Valyand Campioune Schir William Wallace, Knight of Eillersile. The work was reprinted at Edinburgh in 1594, 1601, 1629, 1648, 1673, and 1758; at Glasgow, in 1665 and 1699; at Aberdeen, in 1659; and at Perth in 1790. The best edition is that of Dr Jamieson (from the MS. of 1488), published at Edinburgh in 1820, in 1 vol. 4to. The work was for about 200 years one of the most popular in Scotland, and it was always sold for half a penny, or was never very easy, ceased to be understood except by scholars. Its place was supplied by a modernised version by William Hamilton of Gilbertfield, published at Glasgow in 1722, with the title of A New Edition of the Life and Heroic Actions of the Renound Sir William Wallace. This is a poor performance, but it continued to be widely circulated among the Scottish people almost to our own day.

HART, the name given to the stag (q. v.) or male of the red deer, from the age of six years, when the antlers grow on the antler begins to appear. Great importance was formerly attached to the distinction of names proper to deer at different ages, and Guilm, in his Heradly, defines hart as above, rebutting the notion 'that a stagge, of what age soever he be, shall not be called a harto until the king or queen have hunted him;' but 'if the king or queen do chase or hunt him, he escape away alive, after such hunting or chasing he is called a harto royall.'

HART, JOSHUA ALEXANDER, R.A., an English painter. Of Jewish origin, was born at Plymouth, in Devonshire, April 1806, entered the Royal Academy, London, in 1825, and exhibited his first oil-picture, 'Instruction,' in 1829. Since then, he has painted, among other things, 'The Elevation of the Cross,' (1830); 'Isaac of York in the Donjon of Front-de-Beau' (1830); 'English Nobility privately receiving the Catholic Communion' (1831); 'Eleanor sucking the Poison from Edward's Arm,' 'Milton visiting Galileo in Prison' (1847); and 'The Three Inventors of Printing' (1852). In 1835, H. was elected an Associate, in 1840 an R.A., and in 1855 he succeeded Leslie as Professor of Painting in the Royal Academy. His picturesque vigour and technical power are universally acknowledged.

HARTEBEEKST. See KAAMA.

HARTFORD, a city, and one of the two capitals of Connecticut, United States, America, is situated on the west bank, and 50 miles from the mouth, of the Connecticut river, at the head of stook navigation, and distant 111 miles north-east from New York. The legislature meets here and at New Haven alternately. It has a handsome state house, city hall, arsenal, deaf and dumb asylum, an admirable asylum for the insane, an Episcopal college, a popular annual fair, and many banks and insurance offices. It has a large trade and many flourishing manufactory works, among which is the large establishment for the making of
HARTFORD CONVENTION—HARTLEY.

Coles' firearms. The various manufactures amount for 10,000,000 dollars, and enable the city with all New England, and many lines of steam-boats, packets, and sailing-vessels carry on an extensive commerce. Tobacco and silk are among its exports, and its manufactures of cotton, books, carriages, clocks, machinery, &c., are distributed over the whole continent. It is one of the oldest towns in New England, the seat of early Puritanism, where were enacted the famous 'Blue Laws.' It was also the seat of the Hartford Convention (q. v.).

HARTFORD CONVENTION, in the political history of the United States, was an assemblage of delegates from the New England States, at Hartford, Connecticut, December 15, 1814. This convention was proposed by the Massachusetts legislature, which appointed delegates from that state. The government of the United States, under the presidency of Mr Madison, declared war against Great Britain in 1812, for injuries to commerce growing out of the war with France, and the impressment of American seamen by British men-of-war. Of the American political parties, the Democratic-Republican faction, which was the Federalists in politics, sustained the administration of the government. The governors of these states would not allow the militia to leave them, and complained that while their people were taken by conscriptions, their own coasts were left undefended. The ostensible object of the convention was to devise means of security and defence. George Cabot of Massachusetts was elected president, and Theodore Dwight of Connecticut, secretary. It sat 20 days with closed doors, and as it was supposed to be of a treasonable character, it was watched by the officers of the government. The convention, at rising, proposed certain amendments to the constitution—free population as the basis of representation, a single term for the presidency, to exclude foreigners from office, to limit enrolments to 60 days, and to require a two-thirds vote of congress to admit new states, make war, &c. Though no treasonable act was committed, and no treasonable intention proved, the Federalist party never recovered from the discreditable position to the government, and 'Hartford Convention Federalists' has been to this day a term of reproach.

HARTLEPOOL, a municipal borough, seaport, and market-town of England, in the county of Durham, is situated on a small peninsula, north of the estuary of the Tees, 20 miles east-south-east of Durham. It consists of one principal, and of several smaller streets, and was formerly surrounded by walls. The harbour is safe, and easily accessible; extensive docks have recently been constructed. Fishing is here carried on with success. The factories afforded by H. for sea-bathing formerly attracted many visitors hither during the summer months; but since its recent commercial revival, owing to the creation of railways connecting it with the coal-mines of Durham, it is no longer visited for that purpose. In 1861, 12,478 vessels, of 1,726,258 tons, entered and cleared the ports of H. and West Hartlepool (q. v.). The trade of H. is chiefly in coal. Pop. of municipal borough (1861) 12,245.

HARTLEPOOL, West, a modern market-town and seaport in the county of Durham, situated one mile to the westward of the ancient borough of Hartlepool, and within the township of Stanhope. It has sprung into existence during the last 25 years, having been founded by Ralph Ward Jackson, Esq., an enterprising railway speculator, in 1847. It consists of one principal and several diverging streets, and possesses a large and handsome Gothic church, several large hotels and dissenting chapels, a theatre, Athenaeum, and Mechanics' Institute, Custom-house, Market-house, and other public buildings, and had (in 1861) a population of 13,601. The first harbour was constructed to cover an area of 12 acres, and has since been enlarged to 44 acres. There are one coal and two merchandise docks, covering an area of 32 acres, besides timber-docks, ponds, and yards, of 44 acres, and two large graving-docks. The whole area occupied by these docks, including the floor area of two gigantic warehouses recently built, is 245 acres. In 1847, the number of ships entering the port was 460; in 1861, it was 5964. In the former year, the coal shipped here amounted to 54,202 tons, in the latter year, to 975,319 tons. The foreign merchandise exports from the manufacturing districts of West H. commenced in 1853, in which year their declared value was £23,546; in 1861, it was £203,400. In the former year, 83,010 qrs. of grain were imported, and in the latter year, 204,729 qrs. Besides coal, the following are the principal imports: Flax and hemp, grain, timber, butter, cheese, fruit, cattle, tallow, yeast, iron, zinc, &c.; the exports consisting of wool, cotton goods, copper, cement, drugs, machinery, earthen-ware, yarn, hides, &c.; the trade being carried on for the most part with the Baltic ports, Cronstadt, St Petersburg, and Danzig, and with Hamburg and Rotterdam. Iron-ship-building is carried on here on a large extent, and there are large iron-foundries and cement-works, but no other manufactories.

HARTLEY, DAVID, a celebrated mental philosopher of last century, was born 1730. His father was vicar of Armley, in Yorkshire. At 15, he entered Jesus College, Cambridge, and became a fellow of the college. He studied at first for the church, but his turn for original and independent thinking led him to disent from some points in the Thirty-nine Articles, and he, in consequence, had to abandon his original intention. What his precise difficulties were, we are not informed; we know only that, in his mature years, he impugned the eternity of a fall punishment, maintaining the ultimate restoration of the damned. In all other points, his published opinions coincided with the Church of England, and he continued to the last a member of the church. He finally chose the profession of medicine, in which he obtained a considerable eminence. He practised as a physician successively at Newark, Bury St Edmunds, in London, and at Bath, where he died on the 25th of August 1757, at the age of 52 years. His work on the mind, entitled Observations on Man, on which his fame rests, was begun when he was about 25, and occupied his thoughts for 16 years. It was published in 1749. The first part relates to the constitution of the human mind, and is the really important and original part. The second part treats of religion and morals, and might have been written by any orthodox clergyman, if we except the opinion above stated with reference to future punishment. His handling of the mind turns throughout upon two theories or hypotheses, which have very different merits, and are by no means necessarily conjointed, although they are never separated in his mind. The first is called the Doctrine of Vibrations, or a theory of nervous action analogous to the propagation of sound, the suggestion of which he owed to Newton, of whose writings he was a devoted student. His second and most valuable innovation consists in shewing that the faculties, powers, and feelings of the mind might be explained to a very wide extent
by the principle of the Association of Ideas (see Association of Ideas), a principle far from new in the statement of it, but never before appreciated in any thing like the range of its bearings upon the phenomena of mind. The doctrine of vibrations supposed that when any one of the senses is affected by an outward object, the effect was to set the particles of the nerves in a vibratory motion, which ran along to the brain, and produced corresponding vibrations in the cerebral substance. In like manner, when an active impulse proceeded outwards to the muscles, the manner of communication along the nerves was of the same kind. He even extended these molecular vibrations to the other tissues. As a hypothesis, this assumption was so far legitimate, if it served to explain the facts, or even to imagine in a probable way that general action of the nerves, and brain during the processes of sensation, thought, and volition. The distaste that has generally been entertained towards this part of H.'s speculations, arose from a mistaken notion of its favouring materialism, but only was the authority of a materialist —being most express in affirming a spiritual entity different from the body—but his views had nothing more of materialism in them than the views that mankind have always held as to the connection of mind with bodily actions.

As regards the second doctrine of H., the doctrine of Association, he was certainly the first to do justice to the applications of that principle to explain the phenomena of the mind. He points out how it is involved in the conversion of our sensations into ideas, throughout all the senses, and also in the first origin of voluntary power, which he truly regards as essentially an acquired power. He then treats of the commonly recognised intellectual faculties—Memory, Imagination, Reason, &c.—showing how widely the process of association pervades them all. Lastly, the Emotions, which he classifies under six heads—Imaginative Emotions, Ambition, Self-interest, Sympathy, Therapeutics (the religious sentiment), and the Moral Sense—may be readily seen to be, in a great many instances, the products of association, there being certain elementary feelings that unite among themselves, and pass into new connections, and birth into complex feelings under the general law. Many of those explanations would be considered now as faulty or defective; but at the time, H.'s attempt was a great step in advance, and might have been much more fruitful in consequences to mental science, but for the unfortunate and mistaken prejudices excited by the vibration theory, which he carries out into every part of his exposition.

HARTMANN VON DER AUE, or VON AUE, one of the old German poets, born about 1170, was a Swabian knight. He had probably begun the study of grammar, knew French when he joined the Crusade in 1197, and, as he himself says, could obtain, by his own reading, material for his narrative poems. Of these the first was Erce (the legend realised. Not only in Tennyson's Idylls of the King), written shortly before 1197, and edited by Haupt (1839); the last was Inein, written before 1204, and edited by Benecke and Lachmann (1827; 2d ed. 1843), with a dictionary by Benecke (1835). Both of these are drawn from the Arthurian cycle of legends; and their natural development of events displays a completer mastery of their material than the more incoherent British narratives which form their basis. Between the composition of these two poems, H. wrote the religious legends, Grezer auf dem Steine (ed. by Lachmann, 1838), which was read in churches till the 16th c. and Der arme Heinrich (Longfellow's Golden Legend), which has been edited by W. W. Müller (1842), and also, along with H.'s Lieder und Büchlein, by Haupt (1842). By these works, which have all been translated into modern German, H. was known among his contemporaries. Gottfried von Strasburg, in his Tristan, written about 1207, praises him as still alive; and his death is lamented about 1229, by Heinrich von dem Turlein, in his Krone.

HARTOGIA, a genus of trees, or shrubs, of the natural order Celastraceae. H. Capnæus, a native of the Cape of Good Hope, is only ten or fifteen feet high, but the trunk is a foot to a foot and a half in diameter. The wood is hard, fine-grained, close, and tough; it is much valued, and when polished, is superior to the finest mahogany. It is often used for veneering. The Dutch colonists call it Lude-seod, probably from one of the first uses to which they found it convenient to apply it.

HARTSHORN, the term given in pharmacy to the outlers of the Cereus claphus. Its composition is very different from that of persistent horns, as those of the ox, for example, and is identical, or nearly so, with that of bone. The products of its distillation were formerly much used in medicine, under the titles of Oil of Hartshorn, Volatile Salt of Hartshorn, Spirits of Hartshorns, &c.; but they are now replaced by simpler preparations of the active ingredients of these substances, namely, ammonia and carbonate of ammonia. See AMMONIA.

HART'S-TONGUE (Scolopendrium), a genus of ferns, of which one species, S. vulgare, is a native of Britain, and is common in most parts of the country, in moist woods, shady banks, caves on the sea-shore, and other cold and damp situations. It is also found on the continent of Europe and in North America. It is very different in appearance from every other British fern, its fronds being, in general, quite undivided—although sometimes, by monostrophy, they are forked and even multipartite —linear, from a few inches to two feet in length, and from an inch to two or three inches in breadth. The sori are in transverse lines, on the lateral nerves. Fine plants of this fern have a very ornamental appearance, and are in their greatest luxuriance in winter.

HARTZENBUSCH, Jean Eugenio, a modern Spanish dramatic poet of German extraction, was...
HARUH—HARVEST BUG.

 refuses to perform his first work, Amano de Terol, in 1836. His principal works since then, all of which have been published at Madrid, are Doña Mercé (1838), La Redoma Encantada (1839), La Insurreccion (1840), Alfonso el Casto (1841), Primavera Yo (1842), Honoreria (1842), El Buchiller Mendarosa (1842), La Coja y el Encogido (1843), and La Madre de Polpo (1846). He has also collected and republished his fugitive poems and prose-essays under the title of Ensayos Peticubes y Artículos en Prosa, Literarios y de Costumbres (1843; Paris, 1850). His writings are characterised by glowing imagination, vigorous diction, and sonorous versification. H. is considered one of the most original of the living poets of Spain. He is also one of the few who possess any solid knowledge of German literature.

HARUH, surmised Al-Raschid, i.e., the Just, the most renowned of the Abbaside califs, succeeded his elder brother, Haudi, in the califate, in the year 786, not having yet attained his twenty-first year. Various insurrections in the interior of the kingdom were speedily put down, and the caliph, in order to strengthen his position by conquest, sent expeditions against the Byzantines and the Chasars brought to an end. Though the boundaries of the vast empire, which extended from the Caucasian to the sources of the Nile, were not enlarged, the empire lost none of its former grandeur. H. gave himself up unreservedly to the pleasures of life, leaving the entire administration of his extensive kingdom in the hands of Yahya, the Barmecide, and his four sons; and the energy of their administration, the enforcement of laws, and the general prosperity of the country, proved that his confidence was not misplaced. His capital city of Bagdad he rendered the most flourishing city of that period. Tribute was paid to him from all quarters, and splendid edifices were erected by him at a prodigious cost. At the same time, he was the patron of learning, poetry, and music, and his court was the resort of the most eminent Mohammedan of the age. He was celebrated in countless songs and narratives; and is the hero of several of the stories in the Arabian Nights. Towards the end of his reign, he conceived a rooted hatred towards the Barmecides (see Barmecides); yet so well did he know their tried fidelity, that he suffered the reins of government to remain in their hands for some time afterwards. In 803, he caused the vizier, his four sons, and all their descendants, one only excepted, to be executed, not even excepting his favourite John. In the same year, he was seen to ramble through the streets of Bagdad. On the destruction of this family, his affairs fell immediately into irretrievable confusion; treason and rebellion, no longer dreading the far-reaching arm of the abel vizier, shewed themselves in every corner of the empire; and now, when it was too late, H. thought with bitter regret of his savage cruelty to that abile family. The most formidable of these insurrections having broken out in Khorasan, in the north-east of the empire, H. marched in person against the rebels. But an attack of apoplexy obliged him to remain behind in Tis, where he soon afterwards died, in the month of March 809. The tales of the Arabian Nights have thrown a false halo round his memory, for though he was perhaps one of the most enlightened monarch of the age, yet, like the most of the Abbaside race, he could, when it suited him, act to perfection the part of the avuncular and bloody tyrant.

HARU'S PI CES. The word haruspices, or haruspex, is derived from the Latin haruspicin, victimarum, and haruspices, a seer. The haruspices are, therefore, seers of the ruminating stomach. It is said that they derive their name from the Latin haruspicus, victimarum, interpres, and the root spec-, to see or look. The haruspices seem to have come originally from Etruria, whence the Romans derived many of their religious institutions. Their art, haruspicea, which in many respects was like that of the Augurs (see AUGURS AND AUGU SICES), consisted in interpreting the will of the gods by inspecting the entrails of the animals offered in sacrifice (hence they are also called extispices), and by observing other circumstances connected with the offerings, such as the willingness or unwillingness of the victim to come to the altar, the flame, the smoke, &c. They took indications also from earthquakes, lightning, and all other extraordinary phenomena of nature called portenta. The haruspices did not equal the augurs in dignity and respect; they were regarded rather as media of communication with heaven, than as possessing any independent religious authority. They had no organisation, like the augurs; they did not, in earlier times at least, form a collegium, nor had they a magister. They were, however, at one time considered of great importance; but latterly their art fell into disrepute with the most enlightened of the Roman citizens. Cato is alleged to have said that he wondered that one haruspex did not laugh when he saw another. Some of the later emperors, Augustus, Trajan, and Hadrian, continued in the portent of the haruspices, and encourage the art of the haruspices, but it was finally abolished by Constantine. Their sacred books were called libri haruspicii, fulgurales, and toisiriales.

HARVARD COLLEGE, the oldest college in the United States, often called a university, was founded at Cambridge, Massachusetts, three miles from Boston, in 1636, only six years after the settlement of the colony, 2000 having been appropriated in three sums for the support of 'a school or college.' In 1639, this 'school' was named Harvard College, in honour of the Rev. John Harvard, who gave it £700. It has been well endowed by private liberality, chiefly that of the merchants of Boston, and has, beside its valuable landed property, 1,000,000 dollars of invested funds. At its first establishment, this now flourishing college was little more than an Indian school. Many Indian youth were received, but only one ever graduated. They were found utterly unfit for the life, pursuits, and studies of civilisation, and those partly educated went back to their forests and wigwams. The first president of Harvard was the Rev. Henry Dunster, 1640. In 1764, the library was destroyed by fire; the only works saved being an Oriental Collection, which was bequeathed by Dr Lightfoot, and Roman classics, presented by Bishop Berkeley. In 1818, a scientific department was generously endowed by Abbott Lawrence, for the benefit of persons who do not wish to pursue the full course. The government is vested in the president, five fellows, and treasurer, with a board of overseers, formerly composed of the congregational ministers of sixteen adjoining towns. In religion, it is Unitarian, but liable to change, on account of the overseers being now appointed by the state legislature. Connected with the college are four professional schools, of law, theology, medicine, and science. There are 33 professors, 18 tutors, 730 students, and libraries of 125,400 volumes.

HARVEST (Ger. herbst, autumn; probably allied to Gr. Harm, Lar. corp., to snatch, pluck, gather), the season of gathering and storing the chief products of the fields. The most important harvest operations are those connected with the cutting down of the grain crops, in which, as in the mowing of hay (q. v.), machines moved by horses are now extensively used. See Reaping.

HARVEST BUG (Leptus autumnalis), is an animal of the Acharus tribe, which derives its popular
name from its attacking the labourers employed in the harvest. As the scari in their perfect state are usually provided with eight feet, and in their larval stage with only six feet, and as the H. B. has only the latter number, it was suspected by Siebeck, and it has been once proved, that the animal is the larva of one of the Trombididae, a family of Acaridans. It is so minute, that, were it not for the brilliancy of its colour, which is a vivid crimson, it would be quite invisible. It makes its appearance, or rather rewards us conscious of its presence, about the middle of July, and disappears towards the middle of September; and is most plentiful in hot dry seasons. It occurs on the blades of grass, and on various plants in fields, gardens, and woods, and attacks not only man, but the dog, cat, &c. Persons with delicate skins are its special prey, and it seems to prefer the legs, the under part of the thighs, and the lower part of the abdomen. The wound it inflicts—how produced is not well understood—occasions insupportable irritation, which usually leads the victims to scratch themselves, and thus to increase the inflammation. The skin becomes swollen and red, and sometimes even purple; and the minute vesicles caused by these animals sometimes terminate in suppuration.

**HARVEST MOON.** In our latitudes, at the time of full moon nearest the autumnal equinox, it happens that the moon rises for several days nearly at sunset, and about the same time by the clock, instead of rising, as it usually does, 52' later on one day than on the preceding. This phenomenon is owing to the fact, that at this time the moon is in Aries, when the part of the ecliptic below the horizon makes the least angle with it, as shown in the following figure, where AB represents a portion of the equator; HCH, a portion of the horizon; C, a portion of the ecliptic when C least 11° 44'; in lat. 64° 27', the least retardation is zero, or the moon rises at the same time on two successive evenings, while at the Arctic circle (67° 30') it rises 4' earlier on the second evening. As this phenomenon occurs at a time (about the 23rd of September) when the farmer is busy with his harvest, and very opportunely supplies him for several evenings with light sufficient to continue his operations after sunset, the moon at this stage has received the name of 'harvest moon.' As the month proceeds, the moon's increasing declination and passing to the ecliptic will be increased or diminished according as the ascending node is between Capricorn and Cancer, or between Cancer and Capricorn. It is nothing at the equator, increasing as we proceed north. At our antipodes the greatest retardation occurs in September, and the least in March.

**HARVEY, George.** A Scottish artist, was born in the neighbourhood of Stirling in 1806. Displaying a taste for drawing, he was at the age of 18 placed in the school of the Trustees' Academy, Edinburgh, with a view to rapid progress. In 1836, when the Royal Scottish Academy was instituted, he was elected an Associate, and in 1829 an Academician. Since his entrance, he has been a constant exhibitor, and many of his works are well known through the medium of engravings. The principal of these are—'Covenanter Preaching,' 'Battle of Drumclog,' 'The First Reading of the Bible in Old St Paul's,' 'The Curlers,' and 'Columbus discovering America.' He has not confined himself to historical art, some of his most successful works being representations of the scenery of his native country. He is a Presbyterian, and Presbyterianism is visible in all his pictures. He is the only artist who has painted a Covenantant. His landscapes are remarkable for pastoral peace, and some of the more imaginative for a singular solemnity of atmospheric effect.

**HARVEY, William.** The discoverer of the circulation of the blood, was born at Foulstone, in Kent, on the 1st of April 1578. His father was a yeoman; and five of his brothers were merchants of weight and substance, magni et copiosi, in the city of London, while the sixth sat as member of parliament for Hythe.

After six years' attendance at the grammar-school at Canter bury, H., being then 16 years of age, was entered at Caius College, Cambridge, where he took his first degree in arts in 1597, and having selected physic for his profession, left Cambridge about the year 1600, and proceeded to the university of Padua, then the most celebrated school of medicine in the world. Having passed five years at that school, he attended on the lectures of Fabricius de Aquapendente, Julius Casserius, and other eminent men, who then adorned that university, he obtained his diploma as doctor of medicine in 1602. He returned to England in the same year; and after receiving his doctor's degree from his original university, Cambridge, settled in London as a physician. In 1609 he was appointed physician to St Bartholomew's Hospital, and in 1615 lecturer in anatomy at the College of Physicians—an office then held for life; and it is generally supposed that in his first course of lectures (in the spring of 1616) he expounded those original and complete views of the circulation of the blood, which have since been indubitably associated. It was not till the year 1628 that he gave his views to the world at large, in his celebrated treatise entitled *Exercitatio Anatomica de Motu Cordis et Sanguinis,* (4to, Franc.), having then, as he states in the preface, for nine years or more, been on demonstrating the subject in his college lectures, illustrating it by new and additional arguments and freeing it from the objections raised by the
skill amongst anatomists. Shortly after H.'s election as Lumleian Lecturer (in 1617 or 1618), he was appointed physician extraordinary to James I., and in the beginning of 1630 was engaged 'to accompany the young Duke of Lennox in his travels beyond seas.' In 1632, he was formally chosen physician to Charles I.; and in 1633 we find that his absence 'by reason of his attendance on the king's majesty,' from St Bartholomew's Hospital was complained of, and that Dr Andrews was appointed as his substitute, 'but without prejudice to him in his yearly fee or in any other respect'—a procedure which shows the esteem in which H. was held. We learn from Aubrey that he accompanied Thomas Howard, Earl of Arundel, in his embassy to the emperor in 1636; and during this journey he publicly denounced to Sir Hofmann, the distinguished professor of Nuremberg, and one of the chief opponents of his views, the anatomical particulars which made the circulation of the blood a necessary conclusion—a demonstration which, it is reported, was satisfactory both to save Hofmann himself, who still continued to urge futile objections. He attended the king in his various expeditions, and was present with him at the battle of Edgehill (October 23, 1642). During the fight, says Aubrey, 'the Prince of Orange and Lord of York were committed to his care.' He told me that he withdrew with them under a hedge, and took out of his pocket a book, and read. But he had not read very long before a bullet of a great gun grazed one of his fingers, and made him remove his station.' He accompanied the king after the battle to Oxford, where, according to the same authority, 'he came several times to our college (Trinity), to George Bathurst, B.A., who had a hen to hatch eggs in his chamber, which they opened daily to see the progress and way of generation;' and where the honorary degree of Doctor of Physic was conferred on him in the December of that year. In 1645 he was, by the king's mandate, elected warden of Merton College: but on the surrender of Oxford to the parliament in July 1646, he left the university, and returned to London. He was now 68 years of age, and seems to have wished to free himself from public practice, and from all further participation in the fortunes of his royal master. During the remainder of his life, he was usually the guest of one or other of his brothers, now men of wealth and high standing in the city; and he was at the country-house of one of them that Dr Ent visited him at Christmas 1650, and after 'many difficulties' (see Dr Ent's Epistle Dedicatorily, in Willis's translation of Harvey's works) obtained from him the MS. of his work on the generation of animals, which was published in the following year, under the title of Excercitaciones de Generacione Animalium, quibus acccedunt quedam de Partih, de Membranis ac Tumuribus Uteri, et de Conceptione, 4to.

From this period to the time of his death, the chief object which occupied his mind was the welfare and improvement of the College of Physicians, to the buildings of which he erected a handsome 3rd in 1635, and, in 1643, was elected, in his absence, president of the college, but he declined the office, on account of his age and infirmities. In July 1650 he resigned his Lumleian lecturership, which he had held more than forty years; and in taking leave of the college, presented to it his patrimonial estate at Burmarsh, in Kent, then valued at £56 per annum. He did not long survive, but, worn down by repeated attacks of gout, he died, according to Aubrey, on June 5, 1657, and was buried in a vault at Hemstead, in Essex, which his brother Elia had built.

A handsome edition of Harvey's works, in Latin, revised by Drs Lawrence and Mark Akenside, was published by the Royal College of Physicians of London, in 1666. The best edition, in English, is that of Dr Willis, published by the Sydenham Society in 1847.

HARWICH, a municipal and parliamentary borough, seaport, and market-town of England, in the county of Essex, is pleasantly situation on an elevated and fertile plain near the northwest extremity of a promontory 66 miles north-east of London. Southward from the town extends an esplanade, from which fine views of the harbour and the German Ocean may be obtained. The chief branches of industry are the manufacture of Roman cement, and of artificial manure from Copodite (q.v.), fishing, and ship-building. Steamers run daily to Ipswich, and in summer there is steam communication with London. The harbour of H., formed by the junction of the Stour and the Orwell, is said to be the best on the east coast of England. It is capacious, safe, and commodious; but its entrance is rocky, and, although there are two light-houses and numerous buoys, cannot be entered without careful navigation. H. has been made a harbour of refuge. The battery by which the town is defended was erected about 1820, at which time a considerable space intervened between it and the usual land-mark; but so great has been the encroachments made by the sea on the promontory on which H. stands, that a portion of the battery has already been undermined. Since the time of the last French war, the trade of the town has materially declined. In 1861, 1,597 vessels, of 176,693 tons, entered and cleared the port. Pop. (1861) 5062.

HARZ MOUNTAINS, a broad mountain-range in the north of Germany, extends east-south-east from Goslar and Osterode in Hanover to Bettestadt and Mansfeld in Prussian Saxony. It forms an elevated plateau, covered with irregular and, for the most part, forest-clad mountains, and situated mainly in Hanover and Brunswick. The range, which is divided into Upper and Lower Harz, is 50 miles in length, and 15 miles in breadth, and covers a supercilius of upwards of 2700 square miles. It is composed for the most part of greywacke belonging to the Devonian formation, and broken through in one or two places by granite; and is divided by the Brocken (q.v.) and the Ramberg. The highest peak of the range is the Brocken. The H. M. are exceedingly rich in metals and minerals. Silver, iron, lead, copper, zinc, &c. are mined; marble, alabaster, and granite are quarried. Mining, stone-cutting, and the timber-trade afford employment to the inhabitants, who are about 70,000 in number. The H. M. are the scene of many of the wild legendary tales of German literature.

HASDRUBAL, more correctly ASDRUBAL (see helped by Ilion), a name of frequent occurrence in Carthaginian history, there being nearly twenty more or less celebrated individuals so called. One of the best known is that son-in-law of Hamilcar (see Hamilcar Barca), who accompanied his father-in-law to Spain (236 b.c.), and for eight years after the death of the latter, continued to carry out the plans of his great kinsman. The empire which the military talent and energy of Hamilcar had consolidated he consigned to his son-in-law's statesmanship of Hasdrubal. He formed the south and east coasts of Spain into Carthaginian provinces, and founded many towns, the most famous of which was Carthago Nova (now Cartagena), possessing a fine harbour, and lying in its neighbourhood rich mines. This city he adorned with a splendid 'royal palace.' Under his direction,
agriculture flourished; mining was vigorously prosecuted; the tribes as far north as the Ebro became subject to Cartagena, and paid tribute; and powerful colonies were attached to Carthaginian interests by intermarriage and other means. He was at length (220 B. C.) murdered by a slave, whose master he had put to death. He was a leader of the popular party at Cartagena after the conclusion of the first Punic war, and was early brought out into public life. He was a gifted writer, and showed great energy and prudence in a war with the Numidians. But his talents were more particularly administrative, as has been already seen in his Speech on the Africa. He maintained southward to join Hannibal in Umbria, he encountered the Roman consuls, C. Nero and M. Livius, at the river Metaurus. The Romans gained a complete victory; an immense number of the Carthaginian forces were cut down. It seems to H. himself, that what was then lost, rushed into the midst of the enemy, and fell (207 B.C.) as became the son of the great Hamilcar. In generalship and in military bravery he seems to have been little inferior to his father and his brother.

A third H. was one of Hannibal's principal officers in his Italian campaigns, and largely contributed, by a well-timed charge, to decide the victory on the day of Cannae. At the battle of Ebro, he was at first commander without the city (another H., grandson of the Numidian Masinissa, being general within the city), but he ultimately became sole leader, and opposed all the plans and movements of Scipio with great energy and skill. But at length Carthage fell, and H. was carried prisoner to Rome, to adorn the triumph of his conqueror.

HASE—HASLAR HOSPITAL.

Karl August, an eminent living theologian of Germany, was born at Steinbach, in Saxony, 25th August 1800, and, after leaving Altenburg gymnasia, studied theology at Leipzig, Erlangen, and Tübingen. For taking part in the Burschenschaften, he was, after a tedious trial, confined for five months in the fortress of Hohenasperg. In 1829, after having been Privat-lehrer for a year, he was made extraordinary professor of philosophy in Leipzig, where his lectures on Dogmatics and the life of Christ proved especially attractive. He was, indeed, the first critical biographer of Christ who decidedly rose above the old rationalistic conception of Him as merely an excellent moral teacher, his Leben Jesu (1829, 4th Aufl., 1854), which appeared six years before Strauss's, having proposed as its aim to show 'how Jesus of Nazareth, according to divinity, the destiny, by the free act of His own spirit, and by the opportunities of His time, became the Saviour of the world.' Vindicating equally the rights of the individual religious consciousness, and the historical importance of the church, he opposes modern supernaturalism, as in Die Leipziger Disputation (1827), equally with extreme rationalism, as in Theologische Studienfragen (1834—1837), and Die Christliche Lehre (1839—1840); in the first year of his professorship in Leipzig was over, H. was called as professor of theology to Jena, where he still represents the departments of Dogmatics and church history principally. His Hutterus Rotarius (1827, 9th Aufl. 1858) seeks to do justice to the old Lutheran Dogmatics in contrast with modern systems, by exhibiting its harmonious completeness, and in extensive use among German theological students. Besides his Compendium of Universal Church History (1834, 7th Aufl. 1854), which has been translated into English, and is unsurpassed for its concise picture of times, men, and systems, H. has treated special portions of church history in Die beiden Kircheschule (1839, Neue Propheten (1851), Franz von Assisi (1856), and Das geistliche Schauspiel (1858). Several works of his on ecclesiastical law, and his edition of the Libri Symbolici Ecclesiae Evangelicae, are highly valued.

HASHISH is the Oriental name of the plant (or rather of the tops and tender parts of the plant), which is scientifically known as Cannabis indica, and which we term Indian Hemp. The medicinal value of the preparations of Indian Hemp is described in another article. See HEMP, INDIAN. It is the peculiar intoxication occasioned by the use of H., and is now specially referred to.

Various preparations of the plant are employed for the purpose of producing the desired effect. A favourite mode of extracting its active principle is by boiling the tops and flowers with water, to which a mixture of oil has been added, which is then evaporating, and thus forming an oleaginous solution or fatty extract. This fatty extract is frequently mixed with other substances which are reputed to possess aphrodisiac properties, and is taken in the form of electuary, confection, or pastil. The moiones used at Calcutta, the mapunchar employed at Cairo, and the darwames or dawmace of the Arabs, are preparations of this kind.

Dr. von Schult, who has written an elaborate work on this subject (Du Hochschul et de l'Alienation Mentale, 1845), which is based not only on general observation but on personal experience, thus describes the fantasie, which is the term employed in the French to describe the excitement produced by this agent: 'It is really happiness which is produced by the hashish; and by this I imply an enjoyment entirely moral, and by no means sensual, as we might be induced to suppose. The hashish-eater is happy, not like the gourmand or the confirmed man when satisfying his appetite, or the voluptuary in the gratification of his desires, but like him who hears tidings which fill him with joy, like the miser counting his treasures, the gambler who is successful at play, or the ambitious man who is intoxicated with success.' (P. 54.)

One of the first appreciable effects of the drug, is the gradual weakening of the power of controlling the movements, and the obtaining the stage already described; and accompanying, and in part following it, there are observed errors of sense, false convictions, and the predominance of one or more extravagant ideas. These ideas and convictions are generally of an imaginary character, but are suggested by external impressions which are erroneously interpreted by the perceptive faculties. Finally, if the dose is sufficiently powerful, there is a complete withdrawal of the mind from external things.

HASLAR HOSPITAL. See GOETHE.
HASTINGS, according to the French chronicles, the name of a viking or sea-rover of the 9th century. It is uncertain whether he was born in Norway, Denmark, or France, most probably in the second of these countries. The story of his devastations is something appalling. From his youth on to a gray old age his whole delight appears to have been in pillage, rapine, and bloodshed. The shores and cities of France, Spain, Portugal, and Italy are said to have been repeatedly wasted and burned by him and his savage comrades. As the Scandinavian soges, however, speak of several Hastings, the Danish historian Suhum Lassen, and the French chroniclers—who wrote at a much later period—have gathered up the confused four-begotten traditions of the south-west of Europe, relating to all the pirates by this name, and applied them to a single personage, who has thus become in their hands rather a type of the ferocious Norse viking, than a historical individual.

The lower division of the Wealden beds, forming a portion of the Lower Cretaceous period. It consists of a considerable thickness (1000 feet) of sand, calciferous grit, clay, and shale; and differs very little from the Weald Clay, the upper division of the series, except in being a little more arenaceous. The strata have been deposited in shallow fresh water. The sand often exhibits fine specimens of ripple-marks, and the clay which separates the sand-beds sometimes contains cracks that have been produced by the drying of the bed on exposure. The strata are highly fossiliferous, and contain many marine reptiles, including the huge iguanodon and the flying pterodactyl. The remains of several chelonians also occur. The fish belong chiefly to the gaud or placoid orders, the most remarkable being the lepidophis, whose conical plate teeth and thick square enamelled scales are very frequent. The shells belong to genera which inhabit fresh water, such as Paludina, Cycus, and Unio.

HASTINGS, Warren, governor-general of India. Born December 6, 1752, was descended from an ancient family long settled at Haydethune, in Worcestershire. He was early left an orphan; but when only seven years old, he resolved to recover the manor and estate, which had passed out of the possession of his family. He was sent to Westminister School, and promised to be one of the first scholars of his age, when, at 17, he was sent out to India as a writer in the East India Company’s service. Having realized a moderate fortune, he, in 1764, returned to England. In 1769, he again visited India, on his appointment as member of the council at Madras, and in 1772 was promoted to be president of the Supreme Council of Bengal. A year later, parliament enacted that the chief of the presidency of Calcutta should be styled governor-general of India, and that H. should be the first governor-general. The finances of his government were in a disordered state, yet the demands of the East India Company for money were incessant. His first step was to wrest certain rich provinces
from the Great Mogul, and to sell them to Sujah Dowlah, the Nabob of Oude. The Rohillas resented the transfer to a cruel master, and, for a money consideration, infamously lent the nabob the services of the Company's army for their subjuncts. The English Company, however, was put to death by his influence, in order to strike terror into the native population. He exacted vast sums from Cheyne Sing, the Rajah of Benares, and finally confiscated all his possessions.

He formed a treaty with the son of Sujah Dowlah, under which the mother and grandmother of the nabob, known as thebegums or princesses of Oude, were to be stripped of their domains and treasures for the benefit of the Company. These were the chief managers of his Indian administration; but against these are undoubtedly to be set off great public services. He was constantly tramelled by orders from home, and frequently borne down by an able and factious majority in council; yet he preserved the British empire in India from a formidable combination of foreign and domestic enemies. He acted with vigour when the war with France broke out; he broke the power of Hyder Ali, and placed a system by which justice was dispensed, the revenue collected, and peace maintained. He encouraged Asiatic learning. When he left India in the spring of 1785, that great empire was tranquil. A treaty had been concluded with the Peshwa, but the success of Haidar, and the Carnatic had been evacuated by the armies of Mysore. On his arrival in England, he was received with distinction by George III, and the court. The directors acknowledged his services by a unanimous vote of thanks. The Whig opposition were, however, loud and vehement against him, and succeeded in carrying in the Lower House a motion for his impeachment at the bar of the House of Lords. The trial began in Westminster Hall, February 12, 1788, and was conducted by the names of Burke, Fox, Sheridan, Wadham, and Mr. Charles (afterwards Earl Grey). Burke opened the proceedings in a speech which was extended over four sittings; Mr. Fox and Mr. Grey urged the charge respecting Cheyne Sing; and Mr. Sheridan was intrusted with the conduct of the article relating to the princesses of Oude. The interest taken by the public in the impeachment began to decline after these great displays of rhetoric. The trial, notwithstanding, languished for upwards of seven years. On the 149th day (April 23, 1795), it terminated in the acquittal of Hastings. Out of 400 peers, only 29 voted. The last 24 years of his life were passed at Daylesford, where, in the pursuits of literature, and the occupations of a country gentleman, the evening of his eventful, stormy, and checkered career was severely passed. He died August 22, 1818, in his 80th year, and was buried behind the chancel of the parish church of Daylesford.

HAT. A well-known species of head-covering, which has assumed various shapes and characters. What we understand by a hat is a fabric of felt, or a silk material used as a substitute for felt. Hats are only a variety of the still more ancient cap. Our earliest hats, and were at first made of velvet, silk, and other rich materials. Formed of felt, and assuming a certain firmness of fabric, hats began to be manufactured in England about 1510, and we hear of them superseding caps, or softer headgear, in the reign of Elizabeth. The feltling of caps is, however, said to have been long known anterior to this period; and there is a tradition that a knowledge of felted caps or hats had been introduced by the Crusaders. Wool was the material first employed in forming felt-hats; but in time, as trade with America was developed, the fur of the Beaver (q. v.), as finer and softer, came into use, and was long synonymous with hat. For about three centuries, the beaver-hats, dyed black, and prepared with much skill, formed the head-covering of the higher classes in Great Britain; the middle and humble classes, however, were contented with the less expensive caps and bonnets according to the fashion of their ancestors. See Bonnet.

The growing scarcity of beaver-fur led to attempts to substitute a cloth formed of silk plush, drawn over a papier mache frame, before 1810. These were not very successful; and hats of wool or beaver-felt were common until about 1840. The high cost of beaver at length forced on the improvement of silk-hats, and now the beaver is almost entirely superseded; while the fabrication of silk-hats has been carried to great perfection not only in England, but in continental countries and the United States. The silk-hat consists of a body and rim, the latter being ornamented with frills, feathers, and beads, saturated with varnishes, to give the fabric stiffness, and make it waterproof. These are moulded on wooden blocks according to the fashion of the day; and when the desired shape is produced, the whole is carefully varnished with lac and dammar varnish, and, before dry, the fine silk plush is applied with great nicety, so as to prevent the seams being perceived; it is then trimmed with silk braid on the edge of the brim, and a silk band round the junction of the body of the hat, and the lining of leather and thin silk being put in, it is complete. Lightness, glos, and durability are the prime qualities of the silk-hat; and in these respects the hats of New-York manufacture deserve a high commutation frame, March 1510. Hats are made in London, Paris, and Edinburg; but they are heavier than those of America.

As suggested by the whims of Fashion (q. v.), hats have undergone a wide variety of changes in shape. The raising of the top part in which the head is inserted, and the widening or diminishing of the brims, have constituted the chief differences. Sometimes the top has been high and narrow, sometimes low and broad; and this the brim has sometimes been so broad as to be looped up. Political and religious differences have been marked by the form of hat. The Puritan of the reign of Charles I. adopted the steeple hat (fig. 3), high and narrow, and devolved as the badge of his party. The Cavalier, during the same era, wore a lower and broader crown, with a feather stuck on one side (fig. 4). And a still lower-crowned hat, with a profession of feathers, became the fashion in the reign of Charles II. The Quaker hat, low in the crown, with a broad brim, and quite plain, dates from the origin of the sect at the middle of the 17th century. A growing extravagance in the breadth of brim, led to the device of pulling up the back and sides, and so was fashioned the cocked-hat (fig. 1), which was worn by gentlemen throughout the 18th century. But in this cocked-hat era there were exceptions to the fashion. Beaus in general wore a singularity, with broad-edged hats with brims (fig. 2), and such must be considered the precursors of the present round-hat, which finally superseded every variety of cocked-hat at the beginning of the 19th century. The writer of this can recollect of only three persons wearing cocked-hats as ordinary attire as late as 1810. While cocked-hats ceased to be used by common soldiers at the return of military
HAT MONEY—HATCHMENT.

consequent on the war with the French Republic, officers in the army continued till a later period to wear that species of flattened cocked-hat known according to the nature of the cargo; indeed, is some craft, the whole deck consists of hatchways. When used for purposes of communication, a companion-ladder is placed from each hatchway to the deck below. These ladders are, however, generally limited to the fore and after hatchts. As he emerges through the latter, in ascending to the upper deck, every officer and sailor touches his hat in token of 'salute to the quarter-deck.' When not so used, the hatchway is covered by a wooden grating which admits air to those below, while it protects men operating above from accident. During stormy or wet weather, these gratings are covered with tarpaulins, securely fastened, and the ship becomes water-tight. After an action by boarding, the conquered crew are often flattened down in the lower decks, and then made prisoners as they are allowed to ascend through the hatchway one by one.

HATCHIE, a river which rises in the northeast part of Mississippi, United States, America, and empties into the Mississippi River, near Randolp, about 25 miles above Memphis, Tennessee. It runs through a fertile cotton region, and is navigable by small steam-boats about 100 miles from its mouth.

HATCHMENT, or ACHIEVEMENT, the funereal escutcheon placed in front of the house of the deceased, or elsewhere, setting forth his rank and circumstances. It is in the form of a lozenge, and in its centre are depicted the arms of the deceased, single or quartered.

The achievement of a backler represents his arms in a shield complete, i.e., accompanied with helmet, crest, mantling, motto, and any other external ornaments to which he may be entitled, on a black ground. In the achievement of an unmarried lady, her arms are placed in a lozenge on a black ground, but without external heraldic ornaments except in the case of a peeress, when her supporters, robe of estate, and coronet are added.

The achievement of a husband whose wife survives, impales his arms with his wife's in a shield with the external ornaments to which he is entitled, the ground of the hatchment being, under his side of the shield, black, and under his wife's, white. If the

wife be an heiress, her arms are not impaled, but carried in an escutcheon of pretence. The external ornaments are appended, except the insignia of any order of knighthood having a circle or collar, with which heralds do not consider it proper for a knight to encircle his wife's arms. On this account the achievement of a knight has two shields placed side by side, one containing the husband's arms only, encircled by the collar, ribbon, &c., of the order, the other containing those of husband and wife. The ground is divided perpendicularly in the middle of the second shield, and painted black and white.

Hatchement of Husband.

Hatches: 1, hat copied from a print of the year 1786; 2, large round hat worn in the year 1786, from Kay's 'European Costumes'; 3, hat from a print dated 1645; 4, hat copied from Holier's half-length portrait of 'Robert Devereux, Earl of Essex, his Excellency Lord General of the Army.'
HATFIELD—HAUBERK.

When the wife is a peeress in her own right, there are also two shields—the dexter containing the arms of the husband, with the lady's arms on an escutcheon of pretence ensignied with her coronet; the sinister lozenge-shaped with the lady's alone, and sometimes accompanied with its proper external decorations. The ground is divided black and white in the middle of the dexter escutcheon.

The arms of a wife whose husband survives are impaled with her husband's arms in a shield, or, if the case of a peeress, borne on an escutcheon of pretence. There is no helmet, crest, or mantling, but a peeress is entitled to her robe of estate. The ground under the dexter side of the shield is white, and under the sinister black.

The achievement of a widow differs from that of a husband, in the ground being entirely black.

The achievement of a widow differs from that of a wife, both in having the ground entirely black, and in the form of the escutcheon, which except in the case of an escutcheon of pretence is lozenge-shaped. The arms are encircled by a silver cordon or coronet, the symbol of widowhood.

On the decease of the last of a family, a death's head is substituted for the shield in place of the crest.

The achievement of a reigning king or queen, whether married or not, represents the royal arms complete on a ground entirely black. That of an archbishop or bishop has the insignia of his see impaled with his paternal arms, the whole surmounted by a mitre, and the ground is pale ar. and sa. The dean of a cathedral or collegiate church and a king at arms, also impale the arms of office with their family arms. In the achievement of the wife of a prelate, there are two shields—the first containing the impaled arms of the see and the bishop, surmounted by a mitre; and the second, the family arms of the bishop with those of his wife. The ground is all white, except that part which represents the arms of the wife.

The funeral escutcheon of Scotland, France, and Germany, differs considerably from that in use in England; it indicates not merely the deceased's right to a coat of arms, but his gentility of descent. The hatchment is much larger, consisting of a lozenge above six feet square; and the arms of the deceased, which occupy the centre, are surrounded by those of the eight or sixteen families from whom he derived his descent, the paternal quarterings on the right side, and the maternal on the left. The deceased is not entitled to an achievement unless all these families had a right to bear arms. On the four corners are death's heads and the initials and title of the deceased, the black interstices are powdered with tears.

HATFIELD, a small market-town of England in the county of Hertford, is situated on the slope of a hill, 7 miles south-west of the town of Hertford. It consists of one considerable street, crossed by a smaller one; its trade is unimportant. The palace was once the property of the bishops of Ely, but, together with the manor, was seized by Henry VIII., and was afterwards successively the residence, before their accession, of Edward VI. and Queen Elizabeth. Hatfield House, built by Sir Robert Cecil, is a noble structure, and a fine specimen of Elizabethan architecture. The parish church is an old and interesting edifice of the 13th century. Pop. (1861) of parish, 3371.

HATTRA'S, a town of Hindistan in the North-west Provinces, 33 miles to the north of Agra, in lat. 27° 36' N. and long. 78° 9' E. H. contains about 25,000 inhabitants and has a considerable trade, more particularly in the cotton of the neighbouring district. As a place of some strength, it was at one time prominent in the wars of the Deob; but on falling, in 1817, into the possession of the British, it was immediately dismantled.

HATTERAS, Cape. See CAFE HATTERAS.

HATTI SHERIF, sometimes called HATTI HUMAYUN—i. e., exalted writing, the name given by the Turks to every rescript of the sultan. The hatti sherifs are composed in the Turkish language, and written in the Arabic court-hand Divan. Above the text, as a token of the authenticity of the rescript, stands the intricately flourish or mark of the sultan, usually in black, but sometimes in red or gold. This flourish is called Tugra or Rishkni Sherif—i. e., exalted sign; and the functionary who superscribes it is called Rischändshi, or the signer. The hatti sheri is irrevocable. That of Gulhna, promulgated by Abdul Medjit, November 3, 1839 (renewed February 18, 1850), which guarantees life and property to all subjects of the empire without distinction of creeds, has in modern times obtained the widest celebrity.

HATTO, the name of two archbishops of the see of Mainz, who have a somewhat conspicuous place in the history of Germany. The first of these was Archbishop of Mainz in 881, and died in 913. The second archbishop of that name was a monk of the monastery of Fulda, and succeeded the celebrated Rabanus Maurus, well known in the history of the eucharistic controversy, as director of the monastery of St. Boniface, about the year 942. In the second expedition of the emperor Otho I. into Italy, in 961, H. was sent as his ambassador to Pavia to Rome; and after his return, on the death of Archbishop William, he was named to the see of Mainz, and continued one of the chief directors of the imperial councils. Of his after-life, and of his personal character, the most opposite accounts have been given. By some he is represented as a zealous reformer, and an upright and successful administrator; by others, as a selfish and heartless oppressor; and the strange legend of his being devoured by rats, which Southeby has perpetuated in his well-known ballad of Bishop Hatto, is represented as an evidence of the corruption of the see, which was popularly formed regarding him. It is by no means improbable, however, that this legend is of a much later date, and that its real origin is to be traced to the equivocal description of the tower on the Rhine, Maiesthurn, near Bingen, which has been selected by the author of the occurrence. Maiesthurn may, by a very slight modification, mean either Rot Tower or Toll Tower, and the latter name would naturally arise from the use to which the tower continued even down to a late period to be devoted. The date at which the Maiesthurn was built is unknown, and it is far from certain that it is not much later than the time of Hatto. It was stormed by the Swedes in 1635. Archbishop H. died in 960 or 970.

HATZFIELD, a small town of Austria, in the Tenneret Banat, is situated 24 miles west of Temesvar, on the railway between that town and Pesth. The breeding of horses is here extensively carried on, and there is a large trade in corn. Pop. 5300.

HAUZBERK, a twisted coat of mail, sometimes extending only as high as the neck, but more generally continued so as to form a cowl, leaving only the face of the knight who bore it exposed. In early times, the sleeve of the hauberker sometimes terminated at the elbow, but in the 13th and 14th centuries it came down to the wrist, and since generally descended over the hand in the forma of a glove, either one-fingered or divided. In the 11th, c.
HAUBERT—HAUSER.

the hauberck was worn under plate-armour. See HABBERGEON.

HAUBERT, an old term in feudal law, to denote the tenure of ward and relief.

HAUCH, Hans Carsten, one of the best Danish poets of the present day, was born at Frederiksholm in Norway, in 1791; graduated at the university of Christiania in 1821; and after having travelled through Germany, Italy, and France at the cost of the government, with a view of prosecuting the study of natural history, came to Copenhagen in 1827, and was appointed professor of physics at the Royal Academy of Soroe, in Denmark. This poet H. exchanged in 1846 for the chair of Northern Literature in the university of Kiel, but on the breaking out of the Schleswig-Holstein revolution, two years afterwards, he was compelled to return to Copenhagen, where the dowager-queen, Maria Sophia, offered him an asylum at the palace of Frederiksborg, where he has since then resided; and on the death of his friend Oehlenschläger, in 1850, he succeeded him in the chair of aesthetics at the university of Copenhagen. H.'s earliest attempts at dramatic composition—Contrasterne and Romana—which appeared in 1816—1817, attracted very little at the time, but his tragedy of Tiberius og Bjøjaet, Gregory VII., and Don Juan (1829) at once established his reputation, which he has fully maintained by his subsequent dramas A Knude den Frelsten's Old (The Death of Charles V.), Matriarchte Beljing (The Siege of Maastricht), Send Grenda (1841), and Markst Stig (1850), in which he exhibits great powers of individualising character, and portraying the local colouring of the scenes which he selects; but many of his pieces were translated by himself into German, and were represented with success at the principal theatres of Germany and Sweden. H.'s dramatic epic, Havmardagen, which belongs to the ultra romantick school, has met with less favour among his own countrymen than in Germany, where it elicited the commendatory notice of Tveck, Schubert, and other critics of note; but his Lyriake Dige, 1842 (Lyrical Poems), some of which are extremely beautiful, enjoy an unjustifiable popularity in Denmark. As a writer of tales and romances, H. has shown considerable diversity of talent; the principal are—En Polk Familie (A Polish Family), Skipet ved Rihsen (The Castle on the Rhine), and Goldmynner (The Goldsmith, 1836—1845), Sogn om Thorvald Vistinde (1849), and Die Nordische Mystologie (in German). His Robert Fulton (1853) is regarded as the most perfect of his works. H. has been a voluminous contributor to current Danish and German literature, and in his own country his name is associated with a sharp literary contest, in which he took an active and not always a very dignified part against his countryman and brother-poet, J. L. Heiberg.

HAURIANT, a term in Heraldry applied to a fish placed upright as if to refresh itself by sucking air, as in the example. Gules, three lucies (the ancient name of pikes) hauriant in fess argent, the arms of a family of the name of Lucy in Ireland.

HAUSER, Kaspar, the founding of Nuremberg, was found by a citizen of that town in the market-place, between four and five o'clock in the afternoon of the 26th May 1828. He was dressed like a peasant-boy, and had with him a letter addressed to the captain of the sixth regiment of horse at Nuremberg. Being conducted to this officer and interrogated, it soon became evident that he could speak very little, and was most likely ignorant of all questions he replied, 'Von Regensburg,' (from Regensburg), or 'Ich wanna nit' (I don't know). On the other hand, he wrote his name in firm legible characters on a sheet of paper, but without adding the rest of his birth or residence; it was though requested to do so. H. was then, to judge from his appearance, 16 or 17 years old. Though short and broad shouldered, his figure was perfectly well-proportioned. His skin was very white; his limbs delicately formed, and his face clean, and beautiful, the latter, however, showing no marks of his having ever worn shoes. With the exception of dry bread and water, he shewed a violent dislike to all kinds of meat and drink. His language was confined to a few words or sentences in the old Bavarian dialect. He shewed entire ignorance of the most ordinary objects, and great indifference to the conveniences and necessaries of life. Among his scanty articles of clothing was a handkerch'd marked K. H.; he had likewise about him some written Catholic prayers. In the letter which he carried, dated, 'From the confines of Bavaria, place unknown, 1828,' the writer stated himself to be a poor day-labourer; the father of ten children, and said that the boy had been deposited before his door by his mother, a person unknown to the writer. He stated further, that he had brought up the boy secretly, without allowing him to leave the house, but had89tardly him to a writing, writing class; and that his father, who had formerly served in the sixth regiment, was dead. H. was treated by the magistrates of Nuremberg as a desstitute boy, and became the object of general sympathy. Binder, a burgomaster, exerted himself, in particular, to throw some light on the obscurity in which the origin of the young man was involved. In the course of various conversations with him, it came out that H., from his childhood, had worn only coarse woolen trousers; that he had lived in a dark place underground, where he was unable to stretch himself out at full length; that he had been fed upon bread and water by a man who did not shew himself, but who cleaned and dressed him, and provided him with food and drink while he was in a state of natural or artificial sleep. His sole occupation was playing with two wooden horses. For some time before he was conveyed to Nuremberg, the man had come oftener to his dungeon, and had taught him to write by guiding his hand, and to lift his feet and walk. This narrative gave rise to various suppositions and rumours. H. was, according to some, the natural son of a priest, or of a young lady of high rank; while others believed him to be of princely origin, or the victim of some dark plot respecting an inheritance. Some incredulous persons believed the whole affair to be an imposture. On the 18th July 1828, H. was handed over to the care of Professor Graetz. The history of his education is remarkable in a pedagogic point of view, as his original desire for knowledge, his extraordinary memory, and acute understanding decreased in proportion as the sphere of his knowledge extended. His progress was, on the whole, small. On the 17th October 1829, he was found bleeding from a slight wound on the brow, which he said had been inflicted by a man with a black head. All efforts made to find the perpetrator were ineffectual. The incident excited
Hautbois—Havel.

A great sensation; H. was conveyed to the house of one of the magistrates, and constantly guarded by two soldiery. Among the many strangers who came to see H. was Lord Stanhope, who became interested in him, and sent him, for the sake of his education, to Ansbach. Here he was employed in an office of the court of appeal, but by no means distinguished himself for industry, and was readily forgotten till his death again excited attention. A stranger, under the pretext of bringing him a message from Lord Stanhope, and informing him of the circumstances of his birth, invited H. to meet him in the palace garden at three o' clock in the afternoon of the 14th December 1833, and stabbed him in the left side. H. had sufficient strength left to return home and relate the circumstances of his assassination, but died on the 17th December 1833. Compare Donner, Mittheilungen uber Kauper Hauser (2 vols. Nuremb. 1832); Feuerbach, Kauper Hauser Beispie Eines Verbrechets am Sodenlehen (Ansbach, 1832).

Hautbois, or O'boe, a wind instrument of the 'trumpet' genus. On account of its piercing sound, it was much used in military bands, in the middle of the 17th c., for playing the melody; and from it the whole band was used in Germany to be called Oeseten. The hautbois, at an early stage, took its place as one of the essential instruments of the orchestra. It is made of wood, generally of box, ebony, cocoa, or rosewood, and is constructed in three pieces, or joints, forming a continuous tapering tube, about 21 inches long, the bore of which is narrow at the small end, and widens into a bell-shaped opening, 1 inch in diameter at the mouth. In the upper and middle piece there are holes, by stopping or opening which with the fingers, the player forms the notes of the natural scale, the intermediate semitones being formed by the keys. The reed is fixed upon the end of a small brass tube which fits, socket-wise, into the small end of the upper piece. The sound of the hautbois is rich; and from its great power in swelling or diminishing the sound, it is capable of every variety of expression. Originally, the hautbois had but two keys; others have been added, till the number is now usually fifteen, and sometimes more. Its ordinary use is that of O'boe natural, but by means of the keys it can be played in every key with facility. Its range of available notes is from B to G in alt. Triebert of Paris is now the most celebrated maker.

Hautbois is also the name given by organ-builders to a reed stop of eight feet tone, which is made of metal, similar in shape to the real hautbois, and intended to imitate it in its sound. Its reed is made of thin brass. In all English organs it is an indispensable stop. At the swell, where it is most effective. It is only a treble stop, of which the bass is the bassoon. In continental organs it is found of various scales, and when very fine, is called the Obo d'amoir.

Hautouye Garonne, &c. See Garonne, D'Ette, &c.

Hauy, René Just, a celebrated French mineralologist, was born at St Just, in Picardy, 28th February 1743, studied for the church, and took priest's orders. His attention was turned at a comparatively early period of his life to botany, but most modestly. He opened houses in consequence of accidentally hearing Daubenton lecture on the subject in the Jardin des Plantes, he commenced the study of mineralogy. Linnaeus had already shown that the regular form of crystals was defined by the laws of geometry, but the more delicate laws, and Romé de Lisle had ascertained that the angles are constant in different crystals of the same variety; but the true laws of crystallisation were a discovery by a fortunate accident. See his memoirs on crystallography and mineralogy, amounting to about 100, published between 1782 and 1821. (For their titles and dates, see Vogendorff's Bog. Liter. Handwörterbuch, pp. 1038—1040.) His most important works are his Traité de Mineralogie (Paris, 1801, 4 vols. with atlas), of which a second edition appeared in 1822—1823; Traité Elémentaire de Physique (Paris, 1804, 2 vols.), of which a third edition appeared in 1821; Traité des Caractères Physiques des Pierres Précieuses, 1817; and Traité de Crystallographie, in 2 vols., with a volume of plates, in 1822. He was also a contributor to the Encyclopédie Méthodique, and the Dictionnaire des Sciences. This great work, which has found a narrow escape during the revolution, has already been noticed in the memoir of Geoffroy Saint-Hilaire (q. v.). In 1793, he was appointed on the Commission of Weights and Measures; in 1794, conservator of the Cabinet des Mines; in 1795, teacher of physics at the Normal School; and finally, in 1802, he was appointed professor of mineralogy in the Museum of Natural History and in the Faculty of Sciences. He was an Honorary Canon of Notre-Dame, and, in consequence, generally known as the Abbé Hauy. He died at Paris, 3d June 1822, leaving no wealth beyond the collection on which he had based his great discoveries. This collection is now preserved in the Jardin des Plantes.

Havana, or, in English, the harbour, by far the most important city in the West Indies, is the capital of Cuba (q. v.). It stands on the north shore of the island, in lat. 23° 8' N., and long. 82° 23' W. (Pop. 1853) 134,225; at present it is supposed to reach nearly 200,000. The climate is tropical, and almost uniform. In summer, the average maximum height of the thermometer is 87° F.; in winter, 85° F. Its haven is one of the noblest in the world, while the comparatively narrow entrance is still further secured by six forts, which nearly the whole of the foreign trade of the colony, excepting, perhaps, the illicit importation of Africans, which requires more secluded localities; and it is connected by railroads and the electric telegraph with several places in the interior and on the south coast. Most of the mercantile nations have establishments here. British, Germans, Dutch, Belgians, and Americans, are very numerous. H. is famous for its cigars, and it has also manufactures of chocolate, woven fabrics, and straw-baskets. It is a bishop's see, and the seat of government; and, in addition to a handsome display of religious and political establishments, has a university, a botanical garden, several theatres, and one of the most splendid opera-houses in the world. The buildings are not very remarkable, and the streets are in general narrow, but the promenade of Isabel Segunda, running through the centre of the city, is 30 feet wide; it has a broad carriage-way, with shaded walks and several fountains, of which latter there are about 50 in the city.

Havel, a river of the north of Germany, and a considerable tributary of the Elbe, has its origin...
in a small lake a mile west of the town of New Breditz, in Mecklenburg. It flows southward from its source to Potsdam, and thence west and north-west to its junction with the Elbe, opposite the town of Werben. Its entire length is 218 miles, and it is navigable to Fürstenberg, a town within 30 miles of its source. The H., which throughout a considerable part of its course serves as the connecting link to a long chain of lakes, is of great importance to the internal trade of Prussia. Of its affluents, the Spree, which is longer than the H., is the only one worthy of mention.

HAVELOCK, MAJOR-GENERAL SIR HENRY, K.C.B., was born April 5, 1785, at Bishopwearmouth, in Durham, where his father was a merchant and ship-builder. He entered the army a month or two after the battle of Waterloo, went to India in 1823, and honourably distinguished himself in the Afghan and Sikh wars. In 1836, he commanded a division of the army that invaded Persia. While absent in that country, news arrived of the Indian mutiny, and he hastened to Calcutta. He was directed to organise a small native body in the army, and was sent to Allahabad, and thence to the relief of the British at Cawnpore and Lucknow. He made a forced march to Futtéhpdr, where, at the head of 2000 men, he engaged and broke the rebels. He continued his march upon Cawnpore, and with the remnant of his force defeated the enemy—first at Allahabad, and then at the bridge over the Panda Núdli, 8 miles from Cawnpore. The consequence of the latter victory was the massacre of all the European women and children in the hands of Nana Sahib. He then resolved to fight at Cawnpore, where the rebels were strongly entrenched. He turned their left, and the 78th Highlanders carried the village in a splendid charge. He now entered Cawnpore, and gazed with his men upon the mutilated bodies of the unhappy ladies and children. The sight steeled their hearts, and the avenging column quitted Cawnpore to advance upon Lucknow. H. crossed the Ganges, and repulsed the rebels at Unnao, and afterwards on the same day at Bussurut Gange. After fighting eight battles with the rebels, in all which he was victorious, his little army found itself so thinned by fatigue and sickness, that it was obliged to retire upon Cawnpore. Early in September, General Outram, with reinforcements, and H. again advanced to the relief of Lucknow; Outram, with chivalrous generosity, refusing to take the command out of his hands. The relieving force, which mustered 2500 men and 17 guns, attacked the enemy at Mumgwaluir. It next engaged them at the Alum Bagh, an isolated building, about three miles from the Residency of Lucknow. H. and his column, with desperate bravery, fought their way through streets of houses, each forming a separate fortress, until they gained the Residency, to the indescribable joy of the beleaguered garrison. The victorious army were now in turn besieged, but held their own until November, when Sir Colin Campbell (now Lord Clyde) forced his way to their rescue. After the relief of Lucknow, H. was attacked by dysentery, and died November 22, 1807. Before his death, news arrived of his elevation to the distinction of K.C.B. Other honours were in store, but they came too late. He was made major-general; appointed to the colonelcy of the 3d Foot; and received a baronetcy, with a proposed pension of £10,000. On his death, the title and rank were given to his widow, daughter of Dr Marshman, an eminent minister among the Baptists. A new patent of baronetcy was issued in favour of the eldest son, H. having died the day before the patent was sealed. A metropolitan statue, raised by public subscription, has been erected to his memory in Trafalgar Square. H. was a strictly religious man and a severe disciplinarian, somewhat after the type of the grave and gallant geniuses who fought and conquered under Cromwell. For more than forty years, he said to Sir James Outram in his last moments, 'I have so ruled my life, that when death came, I might face it without fear.' His death, at the noblest moment, when the rebellion had been crushed, excited the deepest sympathy and regret, not only in the army of India, but also among the public at home.

HAVENS. See Harbours.

HAVEN, a term used in Scotch Law to denote the person in whose custody a document is. It often happens that in the course of a litigation it is essential for the court to see, or for one party to rely, on a document in the hands of a third party, in order to get at the haver or holder, letters of incident diligence are issued, which have the effect of compelling him to produce and exhibit the document, or state on oath why he refuses to do so. The term is not used in England, the same party being merely summoned as a witness by being told in his subpena that he must bring the document with him; or, if there is no trial, he may be examined by commission or under interrogatories.

HAVERFORDWEST (Welsh, Heleford), a parliamentary and municipal borough, seaport, and market-town of Wales, capital of the county of Pembroke, and a county of itself, occupies a highly picturesque situation on the side of several steep hills on the west Cleddiron River, 8 miles north-east of Milford, and about 270 miles west-north-west of London. It is well built, but irregular, and is surrounded by several picturesque walks. When the Flemings settled in the district in the reign of Henry I, H. was one of their principal stations. The castle, the keep of which is now used as the county jail, was erected by Gilbert de Clare, first Earl of Pembroke, in the 14th century. The nave of St Mary's Church—one of the finest in South Wales—is remarkable for the beauty of its roof-covering, and for its skilful construction and rich ornamentation. In conjunction with the boroughs of Haford and Narberth, H. returns a member to the imperial parliament. The trade of the town is considerable. Pop. (1861), 7090.

HAVERTHILL, a town in Massachusetts, United States, at the head of navigation of the Merrimac River, on its north bank, 12 miles from its mouth, and 11 miles north of Boston. It is a pretty town, connected by two bridges with Bradford, and the seat of an active manufacturing industry in iron, woollens, hats and caps, railway carriages, coaches, soap and candles, tinware, leather, boots and shoes, &c. In the colonial times, it was a frontier town, and suffered much from the Indians. Pop. in 1860, 9995.

HAVERS, CLOFTON, M.D., an eminent anatomist and physician, who, after studying at Cambridge and Utrecht, where he graduated, settled in London in 1657. His Anatomical, or Some New Obsen- tions of the Bones and the Parts belonging to them (Svo, Lond. 1691), was long a standard work, and his name is indelibly recorded in the annals of anatomy as the discoverer of the Haversian canals in bone. He edited The Anatomy of Man and Woman, from Spacher and Remmelin (folio, Ld. 1691), and was a contributor to the Philosophi at Transactions. The exact date of his death is not known.

HAVERSACK, a bag of strong coarse linen in which, on a march, each soldier carries his wa
bread and provisions. It is borne on the left side by a strap passing over the right shoulder, and is only used in the field and in cantonments.

HAVERSTRAW. A village in New York, United States, America, situated on the west bank of the Hudson River, 60 miles north of New York City. Stony Point, famous in the history of the American Revolution, lies in this township. Steam-boats and sloops carry on an active trade with New York, and there are several foundries and manufactures.

Pop. in 1860, 5400.

HAVYLDAR, the highest rank of non-commissioned officer among native troops in India and Ceylon. In the Hong-kong Gun Lascars, the havyladar receives 1a. 3d. per diem; but in India, his pay is somewhat less.

HAYRE, L. (a contraction of the original name, LE HAVRE DE NOTRE DAME DE GRACE), the second town in the department of Seine-Inferieure, France, and, next to Marseille, the chief commercial emporium of that country, is situated on the north side of the mouth of the Seine, in lat. 49° 29' 16" N., long. 4° 37' E., and 108 miles north-west of Paris, reckoning in a straight line. It has direct communication with Great Britain, Holland, Hamburg, Portugal, Mexico, Brazil, United States, India, &c. It is easy of approach from Paris, with which it is connected by a railway 134 miles long, and the continuation of this line to Strasbourg affords such facility of communication with Germany, that the greater part of the trade of that country with America is carried on through Havre. For foreign trade, the port is the Liverpool of France; it receives annually from 500,000 to 600,000 bales of cotton, nearly three-fourths of the whole quantity imported; it also ships most of the exports to America, and, generally speaking, possesses about one-fifth of the whole trade of the country. The sum-total of its imports and exports exceeds 1,300,000,000 francs (£52,000,000). The imports consist chiefly of cotton, spices, coffee, tea, sugar, timber, coal (from England), &c.; and the exports of French manufactured goods, of wine, brandy, oil, jewellery, provisions, &c.; and the port is visited by about 6000 vessels annually. It has also about 30 vessels and 1500 men occupied in the whale fishery, but this business is declining. It also possesses manufactories of paper, sulphuric acid, tobacco, cotton goods, starch, lace, oil, machinery, ropes, salt, &c., also sugar-refineries; the annual value of the manufactures being estimated at £2,000,000. Its harbour is one of the most accessible in France, and is entered by a narrow channel formed by two long jetties stretching from east to west, and which, owing to the current, requires little dredging. This channel leads to the main-port (outer harbour), which is occupied by great numbers of coasters, and within this avant-port are capacious wet docks, capable of accommodating 500 ships. The largest of these is L'Eure, which contains 700,000 square feet. Among the dry docks, one in course of construction, 515 feet long and 112 broad, is a stupendous work, and will obviate the necessity for sending large steamers for repairs to Southampton. A new basin is under construction in the suburbs of the Leure, which will measure about 53 acres. It was, till lately, surrounded by ramparts and lofty walls; but these were demolished, to admit of the extension of the town, which has now absorbed the neighboring communes of Ingouville and Graville l'Heure, and numbers 80,000 inhabitants. Among the public buildings may be noticed the churches of Notre Dame and St Francis, the new City Hall (built in the style of the Taileries), the tower of Francis L, Exchange, Mansion-house, Arsenal, barracks, and a number of elegant villas which clothe the slopes of Ingouville. The principal institutions are a Royal School of Navigation, a School of Applied Geometry, and a library containing 100,000 volumes. The greater part of the town is modern. It was founded in 1599 by Louis XII., on the site of a fishing village, and was intended as a harbour of refuge for the French navy. It was greatly extended and improved by his successor, Francis I., and from his time rapid rise in importance, especially as the rival harbour of Havre was being gradually silted up with sand. The names of Richelieu, Colbert, Vauban, Napoleon, &c., are connected with the improvements and additions made to the harbour. It is defended by the British in 1684, 1759, 1794, and 1795. Under Louis XIV., it became the entrepot and chief seat of operations of the French East India and the Senegal and Guinea Companies. It is celebrated as the birthplace of Mademoiselle Scoutry, Bernard St Pierre (author of Paul and Virginia), and Casimir Delavigne. The statues of the last two are placed in front of the library facing the harbour.

HAWAII. See SANDWICH ISLANDS.

HAWASA, or, more properly, AUSSA, formerly an important, but now a decayed town of Eastern Abyssinia (q. v.), is situated on the Hawash, in lat. 11° 36' N., and long. 41° 45' E. It is still the seat of some traffic, a perpetual fair or market being held here, at which salt, blue calico cloth, and the produce of the soil, are said to be the chief articles of sale. About H., however, little has yet been ascertained. Pop. estimated at between 5000 and 6000.

HAWASH, a considerable river of Abyssinia, has its origin near the south-western border of the Shoa territory, in lat. about 90° N., and long about 38° E. It flows in the general north-east direction, forming throughout three-fourths of its course the southern and eastern boundary of Shoa, and separating that country from the districts inhabited by the Gallas tribes. It then flows through the territories of the Mubaito tribes, and falls into Lake Aussa, in lat. 11° 35' N., and long. 41° 50' E. The name of the country of Abyssinia (called Habesh by the Arabs) probably originated in that of the river.

HAWFICHIN (Coccothraustes vulgaris), a bird of the Grosbeak (q. v.) genus, and the finch family (Fringilidae). It is considerably larger than the common Grosbeak, the adult male has the back chestnut brown, the neck and rump gray, the wings partly black, the larger wing-covers white. Some of the quill-feathers are rounded and hooked at the end in a very peculiar manner. The H. is a very shy bird, avoiding man, and therefore often observed in districts where it is by no means rare. It is gregarious. It lives chiefly in forests, builds its nest on the highest branches of trees, and feeds very much on beechnut and the kernels of the hazel, plum, cherry, &c. It sometimes visits gardens in search of green peas, and other garden vegetables. It is not uncommon in some parts of England, but is rare in Scotland. It is widely diffused over Europe and the temperate parts of Asia.

HAWICK, a burgh of barony, and the most considerable manufacturing town in the south of Scotland, in the county of Roxburgh, is situated at the confluence of the Teviot and the Slitrig, 10 miles south-west of Jedburgh, and 55 miles south-east of Edinburgh. Among the public buildings are elegant modern buildings, and the town contains several relics of antiquity worthy of mention. Among these are the Tower Inn, part of which was an ancient fortress, and the residence of...
HAWIZA—HAWKINS.

the borders of Drumlanrig, the superiors of the town, and the Moat, a circular mansion supposed to have been used in remote times both as the place of assembly and deliberation of the neighbouring chiefs, and as the seat of the administration of justice. H. carries on the manufacture of Tweeds, to which district, and has long been known as the great seat of the hosiery manufacture in Scotland. The Tweed-trade has greatly increased in importance of late years, and, besides the manufacturers, resident wholesale merchants are largely engaged in it. The stocking manufacture was commenced in 1780. Plaids, shawls, blankets, and leather are also manufactured in the town. In 1862 there were fifteen manufacturing firms, numerous stocking-frame shops, and fourteen mills, thirteen of which were driven by steam and water combined, and one by water. About 1,854,500 lbs. of Cheviot, and 950,000 lbs. of Australian wool are manufactured annually. The ancient municipal constitution of the burgh, founded on a charter granted by James Douglas of Drumlanrig, and confirmed by Queen Mary, was reformed by special act of parliament in 1861. The corporation now consists of fifteen councillors elected by 410 householders, three for each of five wards. The council elect a provost and two bailies from their number, as in royal burghs. By this act, the burgh boundaries extend into the adjoining parish of Wilton. Pop. (1881) 8195.

HAWIZA, a large and important Arab town of Persia in the province of Khorasan, is situated in lat. 31° 15' N. and long. 48° E., 80 miles south-west of the city of Shuster. Previous to 1833, the river Kerkhah flowed through the town from east to west, but a canal having been made to irrigate a tract of country on the north side of the river, and whose level was lower than that of the vicinity, the waters of the river burst through the new opening, and are now lost in a marsh, 15 miles north of Hawiza. The inhabitants of the town can now obtain water only by digging wells in the old bed of the river. Pop. estimated at 12,000.

HAWK, a term often applied to almost all the Falconidae, except the largest eagles, but also used in a more restricted sense to designate a section of the family reckoned among the sympatric hawks, having the wings so short as not to extend to the extremity of the tail, and the bill short and curving from the base. In many of their characters and habits, however, they make a very near approach to the true falcons. The species are numerous, are arranged in several genera, and are distributed over the world. Examples of two of the most important genera are the Goshawk (q.v.) and Sparrowhawk (q.v.) of Britain.

The Hawk frequently occurs as a charge in Heraldry, and may be belted, jessed, and orvelled. The hawk's bell, itself or as a separate charge, is attached to the leg of the bird or it may have the wings attached to the end of the jesses. The hawk's jess, also a heraldic charge, consists of two wings joined with a line, to the end of which is attached a ring. The line is sometimes mottoed or mottoed.

Hawkers, or Pedlars, persons who go from town to town, or door to door, selling wares, goods, or merchandise. Hawkers in Great Britain require (with the exceptions after mentioned) to take out an annual licence to enable them to sell goods in this way; and to get the licence, they require a certificate from the clergyman of the place where they reside, and two inhabitants, attesting them to be of good character and reputation, or a certificate from a justice of the peace or superintendent of police. This back must be marked with the words 'licensed hawk,' and so these words must appear where a room is hired for selling the goods. They are prohibited from receiving goods stolen or smuggled, or in premises, and from selling by auction unless in the place where they reside. They must shew their licence when demanded by officers of custom or excise, or by any person to whom the goods are offered for sale. Severe penalties are incurred when these enactments are infringed, and such penalties are recoverable before justices of the peace. The licence, if for six months, is £1; and if for one year, £2; and if to travel with one horse (exceeding in height 13 hands) the duty was, on 31 June 1862, reduced from £3 to £4. By the same act (25 Vict. c. 22, s. 40), a boon was conferred on hawkers of allowing them to take out half-yearly licences at the above rate. By a recent enactment also (24 and 25 Vict. c. 21, s. 8), a hawker may use a coffee house, as he formerly could not be sold except in a licensed house. It is sometimes difficult to determine when an ordinary trader, who sends goods to a distance for sale, incurs a penalty for not being licensed. It is not necessary, in order to incur the penalty, that the person should go from town to town, provided he go from the place where he lives to another place where he is not a householder, and there sells. But an exception exists to the necessity of a licence in all cases where the person is merely a commercial traveller, or the real worker or maker of the goods he sells, or the servant of the maker, or where he sells printed papers licensed by authority, or sells fish, fruit, or vegetables, or where he is a tailor, cooper, glazier, plumber, harness-mender, and carries materials for mending kettles, tubs, household goods, &c.

The reason why the state imposes this tax on hawkers is, that they have great advantages over regular shopkeepers, as they pay no rent, and often interfere with the natural course of dealing at shops. As they thus are enabled to undersell the shopkeeper without any loss of profits, it is but fair that they should contribute something to the expenses of the country, like ordinary citizens who pay taxes.

HAWKESBURY, a river of New South Wales, in East Australia, enters the Pacific at Broken Bay, about 20 miles to the north of Sydney. Its entire course does not exceed 50 miles, the dividing range of mountains being here very near to the coast. Pitt Town, Willerforce, and Windsor are situated on its banks, and it is navigable from the sea to four miles above the last-mentioned place. Mr. H., even in this land of floods, is remarkable for its inundations. In 1808, the water rose 86 feet; and in 1844, it rose 20 feet in a few hours.

HAWKINS, Sir John, an English navigator, was born at Plymouth about 1520. He has the infamous distinction of being the first Englishman that trafficked in slaves. His 'commercial' career ended in 1568, after which we find him more honourably employed. He was appointed treasurer of the navy in 1573, knighted for his services against the Spanish Armada in 1588, and for the rest of his life was engaged in making havoc of the Spanish West Indian trade. In 1595, along with his kinsman, Drake, he commanded an expedition directed against the Spanish settlements in that part of the
HAWK-MOTH—HAWTHORN.

world, but died, November 21, in the same year. He suffered a hospital at Chatham for the relief of disabled and sick sailors.

HAWK-MOTH, a name sometimes used to comprise all the lepidopterous insects of the section Cephuscula, the Linnean genus Sphix. They have a spine or stiff bristle on the anterior edge of each of the hind-wings, and those being received in corresponding hooks on the under-side of the fore-wings, attach them together. Their wings are generally covered with a looser down than those of butterflies. The body is rather large and thick. Notwithstanding the name Cephuscula, signifying that their period of activity is that of twilight, and which is truly characteristic of the greater number, many of them may be seen darting from flower to flower even at mid-day, or hovering over flowers, from which they suck the honey by their long proboscis. They make a loud humming noise with their wings, and are insects of very rapid and powerful flight. Their caterpillars have always 16 feet. A peculiar position which the caterpillars often assume has led to the name Sphix, because of a fancied resemblance to the sculptured monster of Egypt. Their chrysalids are cylindrical, free from points and angular prominences, blunt-headed, with a conical abdomen, and are sometimes enclosed in cocoons, sometimes concealed in the earth.—The name Hawk-moth is sometimes limited to a division of the Cephuscula, of which the genus Sphix, as now restricted, is the type, and of which the Death's Head Moth (q. v.) is an example. Their caterpillars are smooth and elongated. The name Hawk-moth appears to be derived from the hovering motions of these insects, resembling those of hawks looking for prey.—Many hawk-moths are natives of the Americas, and are sometimes in warm climates. Some of the species have a wide geographical range.

HAWKSBEE, or HAWKSBE, FRANCIS, a natural philosopher of considerable eminence, was born in the latter half of the 17th c., and died about 1730. He was admitted a Fellow of the Royal Society in 1705, and was appointed to the office of curator of experiments to the Society, and in 1723 he was elected assistant-secretary. He contributed 43 memoirs to the Philosophical Transactions, chiefly on chemistry and electricity. Of his experiments in the latter department, Dr Thomson, the historian of the Royal Society, observes, that ' they constitute the beginning of the science, and by drawing the attention of philosophers to that particular subject, were doubtless of considerable service in promoting electrical investigations.' All these memoirs appeared between the years 1704 and 1713. His chief independent work was published in 1709, and was entitled, Physico-Mechanical Experiments on various Subjects; touching Light and Electricity productive on the Attrition of Bodies. He is perhaps best known for his improvement of the earlier air-pumps of Boyle, Papin, and Hooke (a subject fully discussed in Wilson's Religio Chemici, pp. 215–218), and for being the first who used glass in the electrical machine.

HAWKWEED (Hieracium), a genus of plants of the natural order Compositae, sub-order Cicioraceae. They are generally annual, or more generally perennial plants, some with leafless scapes, one-flowered or many-flowered, and some with leafy stems; the leaves, stems, and involucres in many species being hairy. They are very numerous, natives of the temperate and colder regions of the northern hemisphere, particularly abounding in Europe. A number are natives of Britain, and some of them are very common plants. The flowers are generally yellow, but the Orange Hawkweed (Hieracium aurantiacum), a native of the south of Europe, and doubtful natives of Britain, is often cultivated in gardens for its rich orange flowers. It is a perennials, about two feet high.

HAWSE, the situation of the cables in front of a ship's bow, when she is moored with two anchors out forward—one on the starboard, the other on the port bow. The term is also used to denote any small distance ahead of a ship, or between her bows and the anchors at which she rides; as, for instance, when it is said of another vessel 'she sailed athwart our hawse,' or 'she anchors in our hawse.' When the two cables pass directly to their anchors, without crossing or chafing at the hawse-holes by which they enter the ship, the vessel is said to have a 'clean hawse.'

HAWSER. See ROPE.

HAWTHORN (Crataegus oxyacantha; see CRATAEGUS), a shrub or small tree, a native of Europe, Siberia, and the north of Africa, common in Britain, and much planted both for hedges and for ornament. It varies in height from six to eight to twenty or twenty-five feet. It has roundish obvate 3–5-lobed deciduous leaves, and corymba, generally of white, rose-coloured, or sometimes deep crimson flowers, succeeded by a small red fruit (haw) with yellow pulp, the central stony part
bears a very large proportion to the pulp. The fruit remains on the tree after the leaves have fallen, and affords winter-food to birds. There are many varieties of H., and curiously enough, some have only one style, whilst some have several. The variety called Glastonbury Thorn—because supposed to have originated at Glastonbury—Abley is remarkable for its early flowering, which often takes place in the middle of winter, whilst the common kind is not in flower till May or June. The winter flowers of the Glastonbury variety are, however, not generally followed by fruit, and a second flowering often takes place in the same year. The common H. is often popularly called May, from the season of its flowering in England. It is also called Whittens, in contradistinction to the Shoe or Blackthorn. The case of the Hedges, with its enormous intervening very hard, close-grained, and takes a fine polish, but is apt to warp. A fermented liquor, which is very intoxicating, is made from the fruit in many parts of France.

The H. is particularly valuable as a hedge-plant, in consequence of its strong and plentiful spines, its long life, and its ready adaptation to very various soils. For this purpose, it is propagated by seed; the haws are laid in a heap to rot, with a mixture of sand or fine mould, and in a year or sixteen months after, the seeds are sown in ground carefully prepared by digging and manuring with well rotted manure. The seed-drills are about sixteen inches apart. The young plants are kept clear of weeds, and the earth about them occasionally stirred with the hoe. They often grow to the height of a foot or two feet in the first season. They are commonly once transplanted before their final planting to form hedges. When planted, the hedge is grown extremely well, and the natural disposition of the plant to spread out above, can be counteracted, so as to make the hedge as it ought to be, widest at bottom, but uniform in thickness. So well does it flourish, that it is so easy, and in many places, of young H. plants are called quicks or quickets, because used to make living (quick) fences.

HAWTHORNE, Nathaniel, a distinguished American author, born in December, in Massachusetts, in 1804. He was educated at Bowdoin College, where he graduated in 1825, Longfellow being one of his class-mates. He published in 1832 an anonymous romance, which he has never claimed, and which has not yet been identified by the public. In 1837, he published a collection of Twice-told Tales, so called because they had previously appeared in annuals or other periodicals. In 1843, H. removed to Concord, and resided for some time in an old mansion or parsonage, from the windows of which its inmates looked, it is said, upon the first battle of the revolution (April 19, 1775). In 1846, he gave to the world a delightful volume of sketches and stories, entitled A Wonder-Worker. The same year he was appointed surveyor in the custom-house at Salem, and held office there for three years. In 1850, he appeared his Scarlet Letter, a strange and singularly fascinating story of early New England life, which at once raised its author to the first rank among American writers of fiction. In 1851, he published The House of the Seven Gables; in 1852 appeared his Blithedale Romance; and in 1853, Tanglewood Tales appeared. These are H.'s best and his last works. In 1853, he was appointed, by President Pierce, United States consul at Liverpool, which office he held for four years. All critics concede H.'s power to awaken in his readers an intense, sustained, and almost painful interest; but it has been objected that the tone of some of his works is unhealthful. The fire with which the Scarlet Letter glows, observes one critic, is not the glow of natural life, but the hectic of disease, which burns upon the cheeks of its actors. Another doubts whether passions and tragedies like those introduced into the last-named romance are legitimate subjects for fiction, but adds: 'If sin and sorrow in their most fearful form can be presented in any work of art, they have rarely been treated with a lothier severity, purity, and sympathy, than in Mr Hawthorne's Scarlet Letter.' We should fail to do justice to H.'s merits should we pass over without considering his skill in the art of spiritual grace and the ardor and salt of his style. In the language of Mr Longfellow: 'It is as clear as running waters are; indeed, he uses words merely as stepping-stones, upon which, with a free and youthful bound, his spirit crosses and re-crosses the bright and rushing stream of thought.'

HAY (Ger. heu, Dutch, hooj; probably from the root of Ger. hauen, Eng. heue, to cut), the stems and leaves of grasses or other plants dried for fodder eight to ten weeks after they are sown, or in late spring and early summer. In the grassy districts of England, and especially in the vicinity of large towns, the hay-harvest is as important as the corn-harvest, and a large breadth of old pasture is annually cut. In Scotland, however, little of this old natural grass is converted into hay, the crop consists mainly of clover and rye-grass. This requires less turning and labour than the closer succulent natural grass, and with twice turning, and a week or ten days' drying, will generally be fit for the rick, into which the English farmer then places it. In Scotland, the weather is seldom sufficiently fine to cut the hay, within a moderate time, for a large rick, and the practice is to put it up, after a few days, in cock containing one or two hundredweight, and then, after another week, into what are technically called trap-ricks, containing from one to two tons. From these it is transferred at any convenient time to the rick-yard. This practice, although the most universal in the north, is attended with loss of time and labour, and, moreover, bleaches and dries up the hay, giving it the appearance of straw, and preventing that gentle heating which English farmers desire both in their clover and grass hay.

The management of the natural grasses of which most English hay consists is somewhat different, and the process is seen in perfection in Middlesex and various of the counties about London. The grass matter—too generally overlooked in Scotland—is to preserve the colour and flavour of the grass; and this can only be done by keeping it constantly turned, and having it rapidly dried, if possible, without the deteriorating washing of repeated rains. Artificial drying best attains this end, but is of course impracticable on the large scale. In the best style of English hay-making, the grass, after being cut with the scythe or sickle, is as soon as the day is long, laid in rows, and spread out by means of forks or of a tedding-machine drawn by a horse. It is not allowed to lie long exposed to the sun, but before evening, is drawn together by rakes into windrows, which, if there is any prospect of rain, are made up into small heaps or cocks. It is again spread out next morning, or on the return of favourable weather; and when the operations are expedited by wind and sun, the hay will be ready for the winter on the third day. There is, however, much difference in the time during which the hay requires to lie out;
the bulk of the crop and the quality of the land must be especially considered. When the grasses are cut, as they should be when in bloom, and before their seed ripens and their stems get tough and hard, they contain the largest amount of moisture, and require careful making, but produce then the most nutritious and palatable hay. As soon as it is thoroughly dry, it should be put out to once into the stack or rick, and well trodden down. A certain amount of heating improves the flavor and renders the hay more palatable to every sort of stock. When, as is sometimes the case, it is imperfectly made, or picked up too soon, it gets overheated, and becomes dark brown or black, its nutritive properties collapse, and it is worthless. A certain portion of the cut grass, or grey, as it is called, is left in the field to serve as feed for cattle or hogs. When the crop is good, and everything done well, the cost of hand and horse labor expended upon the hay before it is safely ricked will approach 20 shillings per ton. The crop averages from one to two tons per acre. Hay that has stood for seed is tougher and less nutritious than that cut earlier, for the sugar, gum, and gluten of the matured seed have been abstracted from the stems, which are then apt to be little better than straw. For milch cows, well-made English hay is desirable; but good covering hay is richer in albuminous matters, and better adapted for horses and sheep.

**HAYBOTE—HAYDON.**

Haydon, in English Law, is an implied right or liberty of a tenant to take thorns and other wood off the lands he occupies, to repair the hedges, gates, and fences thereof. It also includes wood taken to make razor and fork for gathering hay, whence the name is derived.

**HAYDN, JOSEPH,** a German composer, was born at the village of Rohrau, on the confines of Hungary and Austria, 31st March 1732. He was the son of a poor wheelwright; and manifesting great musical talent, he was received, at the age of eight, into the choir of the cathedral of St. Stephen's, at Vienna. Here he remained till his 16th year, acquiring a practical rather than a theoretical knowledge of his art, by singing the music of the best Italian and German religious composers. In that year, however, his voice broke, and he lost his place as a chorister. He now gave lessons in Vienna, played in the orchestra, assisted himself with composition, and in this manner earned a maintenance. At the same time, he studied with an extreme care the first six sonatas of Emanuel Bach, which had accidentally fallen into his hands. His position, however, continued very critical, and he was on the verge of starvation, when he had the good-fortune to obtain an engagement to play the cello in the orchestra of the Theatre of the University of Vienna, and to receive 20 florins, free lodgings, and table with his secretaries and other officials. About this time, H. married the daughter of a hairdresser, who had been kind to him in his days of penury. This marriage improved his fortune; however, he was always 'a buckler,' said H. near the close of his life, 'whether her husband be a cobbler or an artist.' Her sole ambition was to squander H.'s earnings. In 1760, Prince Esterhazy placed him at the head of his own chapel. For him to dissemble the handsome, for the beautiful symphonies (a style of composition in which he excels all other composers), and the greater number of his magnificent quartets. While in this situation, his patron conceiving the design of disbanding the band, H. composed the famous symphony known as Haydn's Farewell, in which one instrument after another becomes mute, and each musician, as soon as he has ceased to play, puts down his instrument. For the rest, the light, rustling movements of his music are marked with his instinctive feeling. It is said that in consequence the prince changed his mind, and did not dismiss the band. After the death of Prince Esterhazy, in 1790, H. accompanied Salomon the violinist to England, and composed the Grand Symphony of his Twelve Grand Symphonies. His reception was brilliant in the highest degree. In 1794, he made a second engagement with Salomon for England, and during this period brought out the remaining symphonies. In England, he first obtained that recognition which afterwards fell to his share in his own country. On his return to Austria, he purchased a small house with a garden in one of the suburbs of Vienna. Here he composed his oratorios, the Creation, and the Seasons. The former work, the harmonies of which are pervaded with the fire of youth, was written in his sixty-fifth year, and is considered by many to be equal to the finest productions of Handel. The Seasons (completed in eleven mouths) was almost his last work. He died at Vienna, 31st May 1809.

Although H. composed slowly and very carefully, his works are exceedingly numerous, comprising 118 symphonies, 83 quartets, 24 trios, 19 operas, 5 oratorios, 163 pieces for the baritone, 24 concertos for different instruments, 15 masses, 10 smaller church-pieces, 44 sonatas for the pianoforte, with and without accompaniments; 12 German and Italian songs, 20 canzonets, 13 hymns in three and four parts, the harmony and accompaniment to 365 old Scottish songs, besides a prodigious number of diversifications and pieces for various instruments.

--Compare Griessinger, **Biographische Notizen über Haydn** (Leips. 1810); *Vie de Haydn* (Paris. 1817); Grosser, **Biographische Notizen über Haydn** (Hirschb. 1826).

**HAYDON, BENJAMIN ROBERT,** an English painter, was born at Plymouth, January 25, 1786. He exhibited his first picture at the Academy in 1807, 'Joseph and Mary Resting with our Saviour after a Day's Journey on the Road to Egypt,' which found a purchaser in the author of *Anastasius.* It was succeeded by 'Dentatus,' H. quarrelled with the Academy at this time on the question of his picture, and his life thereafter was divided between painting and controversy. His pictures brought him admiration, and his, withful temper procured him foes. As years passed on, the admiration cooled, while the foes remained virulent as ever. At the end of his period, he had many patrons, and his pictures brought large prices; his 'Judgment of Solomon,' for instance, 700 guineas. He made several attempts
to be admitted an Associate of the Academy, and when he was refused, he characteristically imputed the refusal to the envy and jealousy of the academicians, and nailed against them more bitterly than ever. His great work, 'Christ's 20th into Jerusalem,' was exhibited by himself in 1821, but did not find a purchaser. Nothing daunted, H. painted two other subjects from the passion of the Saviour. In 1821, he married, and two years thereafter he introduced the 'Rambler,' in some respects the most powerful of his works. This style of subject—covering enormous canvases—not hitting the public taste, he became involved in pecuniary embarrassment, and was finally incarcerated in the King's Bench, from which, after a time, he was released through the assistance of his friends. While in prison he painted the 'Mock Election,' which George IV. purchased for 500 guineas, and was much admired, and was frequently reproduced. In 1836, he was again imprisoned for debt, and was released on a settlement being effected with his creditors. At this time he entered upon a period of his life which, according to his lectures on art in London and the provinces, brought him fame and money, a circumstance which only increased his rage at the Academy and the artistic public. When government determined to incorporate the new Hougomont with pictures, H. considered that the hour of his fortune had at last arrived. He engaged in the competition, and was unsuccessful. This defeat he never entirely recovered. His last works were 'Uriel and Satan,' 'Curius Leaping into the Gulf,' and some others of a kindred nature. He exhibited two of his latest productions in 1846 at the Egyptian Hall, but the exhibition was closed by the public support, which made the cup overflow. On June 22 of that year, he died by his own hand.

As a painter, H. excelled much temporary admiration, but he does not now rank high. He delighted in classical and sacred subjects, and these modern English taste does not seem to affect. In 1853, Mr. Tom Taylor published 'The Life of Benjamin Robert Haydon,' in two volumes, containing copious extracts from his letters and journals.

HAYESINE, or BORATE OF LIME, known also as BITTER HYDROBORATE, is a mineral, named after the minerologist Hayes, and remains a mineralogical curiosity until 1851, when a specimen was first exhibited as a commercial article in the collection of imports sent to the Great Exhibition in Hyde Park by the town of Liverpool. This brought it into notice; and it is now occasionally imported in very large quantities from the ports of Iquique and Pisagua Bay, in Peru. Owing to the absurd love of the Peruvian government for monopolies, vast quantities of borate of lime are comparatively useless, as that which is received in Europe is almost all smuggled out of the country in opposition to the government decrees. About 5000 tons have been exported altogether, and its value in this country is about £30 per ton. The borate of lime is found in rounded nodules, rarely larger than a good-sized orange, imbedded in the soil at certain spots of the Pampa of Tamarugal, and in the northern part of the desert of Atacama. It is always associated with the nitrate of soda, which is so abundant in that locality. Its chemical composition is CaO.B.O, + 6H,0 (Hayes); or boracic acid, 45.9%; lime, 18.45%; water, 26.57% (John). It is used as a source of boracic acid in the manufacture of the borate of soda, so extensively employed as a fluxing material for glazing pottery; in glass-making, metallic soldering, etc. The only other known sources being the boracic acid from the Tuscan springs, and the borax and tincal from Tibet. See Borax.

HAYNAU, JULIUS JAKOR, BARON VON, an Austrian general, was born in 1786, entered the Austrian service in 1801, and gradually advanced in rank, till in 1844 he was appointed field-marshal. During the Italian campaigns of 1848 he signalized himself by his ruthless rigour, especially at the capture of Brescia. H. was engaged in the siege of Venice, when he was summoned by the emperor to Vienna, in May 1849, to assume the supreme command of the forces in that country. The storming of Raab, the advance southward, the occupation of Szegedin, and the engagements on the Theiss, were all the work of Haynau. But his atrocious severity towards the defeated Hungarians, and especially his alleged flogging of women (a charge denied by H.), excited the hatred and detestation of Europe. In 1850, he was dismissed from the public service, not for his cruelty, however, but for the intractability of his disposition. In the same year, he was brought into unenviable notoriety on the occasion of his visit to the brewery of Messrs. Barclay and Perkins during his stay in London, when he was assaulted by the draymen, and barely escaped with life. For this insult the British government declined giving any satisfaction. On subsequently visiting Belgium and France, he was received by the populace with strong dislike; but by the vigilance of the authorities was protected by the public. This was the period which made the cup overflow. On June 22 of that year, he died by his own hand.

HAYTI, otherwise known as HISPANIOLA or ST. DOMINGO is, after Cuba, the largest of the West Indian Islands. It is nearly equidistant from Porto Rico on the E., and from Cuba and Jamaica on the W., with the Caribbean Sea on the S., and with the Bahamas and the open ocean on the N. H. lies in N. lat. between 17° 37' and 20°, and in W. long. between 68° 20' and 74° 28'. It belongs to the group of the Greater Antilles, or Leeward Islands, and, like all the principal members of its series, its greatest length (about 400 miles) is in the direction—from west to east—of the chain of which it forms a part; its greatest breadth is 160 miles. Area, including the islands of Tortuga, Gonaive, etc., about 28,000 square miles, being somewhat smaller than Scotland; and the population about 760,000. The country, as the native name implies, is mountainous, being traversed longitudinally by a range, which sends out lateral spurs, terminating in headlands on either coast. The range is of volcanic origin—a fact still corroborated by the frequent occurrence of terrible earthquakes. Cibao, believed to be the loftiest summit, is said to be about 7000 feet above the level of the sea. The mountains, richly and heavily timbered, are understood to be susceptible of cultivation almost to their tops. With such a soil well watered, and with a climate tempered by the sea-breezes, H., as a whole, is perhaps the most fertile spot in the West Indies; while its excellence has been particularly displayed in the Bay of Gonaives on the west, offer considerable facilities to foreign trade—hurricanes, however, prevailing in August and September. The rivers are numerous and considerable, and afford for navigation several bodies of fresh water, the salt lake of Henriquillo, near the south shore, claims particular notice, as indicating by its tidal action some subterranean communication with the Caribbean Sea.
The productions are coffee, logwood, mahogany, tobacco, cotton, cocoa, wax, ginger, and sugar; and mines of gold, silver, copper, tin, and iron, though not now worked, are found in many places. But H. once containing within its limits one of the most flourishing colonies in the intertropical regions, has been in a good measure lost to the traffic of the world through the same causes which have rendered its history almost unique in the annals of mankind.

Within little more than an age after 1492, the aborigines had been swept away by the remorseless cruelties of the Spaniards. In connection with this deplorable result, H., already the seat of the first white settlement in America, became one of the earliest fields, in the western hemisphere, of negro servitude. Next came the bucaniers, during the 17th c., to avenge the red man's wrongs; and as these marauders were chiefly French, the western portion of the island, which was their favourite haunt, was, in 1697, ceded to France by the peace of Ryswick, thus presenting the first important break in the unity of Spanish America. For nearly 100 years, the intruders imported vast reinforcements of African mulattoes, but were a natural incident of the concomitant licence, rapidly grew, both socially and politically, into an intermediate caste, being at once uniformly excluded from citizenship, and generally exempted from bondage. In 1789 after the influence of the great French Revolution, the mutual antipathies of the three classes—white, black, and mixed—burst forth into what may well be characterised as the most vindictive struggle on record—the struggle which, before the close of the 18th c., led to the extermination of the once dominant Europeans, and the independence of the coloured insurgents. Thus, as the emancipated bondmen mostly belonged, at least in form, to the Church of Rome, H. now exhibited the one Christian community of negro blood on either side of the Atlantic. In 1801, France sent out a powerful armament to recover her revolted dependency, treacherously seizing and deporting the deliverer of his brothers, Toussaint Louverture. In 1803, however, she was constrained to relinquish her attempt; and in 1804, Dessalines (q.v.), aping the example of Napoleon, proclaimed himself Emperor of H.; thus reviving the indigenous name of the island, which had been in abeyance for upwards of 300 years.

This great change was fatal to the commercial prosperity of French H., decidedly the more valuable section of the island. In its progress, it had destroyed capital in every shape; and in its issue, it could not fail to paralyse labour under circumstances where continuous exertion of any kind was equally irksome and superfluous. Nor was the political experience of the lately servile population more satisfactory than its economical condition. Sometimes consolidated into one state, and sometimes divided into two, the country alternated, through the instrumentality of one revolution after another, between despotism and anarchy, between monarchy and republicanism, between a kingdom and an empire. Its only tranquil period of any duration coincided with the rule of President Boyer, which subsisted from 1820 to 1843—its last 21 years comprising not merely the whole of French or Western H., but likewise the Spanish or eastern portion of the island. H. thus united, besides being immediately recognised by the European powers in general, was soon acknowledged even by France, on condition of paying 150,000,000 francs, or 25,000,000 sterling, as a compensation to the former planters.

About the year 1843, the inhabitants of the eastern or Spanish portion of H., rising against their Haytian oppressors, formed themselves into a republic called the Dominican Republic (q. v.), with a territory of 17,010 square miles, and a pop. of 200,000. In May 1861, the Dominican Republic threw itself under the protection of Spain, in which condition it at present (October 1862) remains. The western portion of the island had been republicated in its form of government previous to 1849, when its former president, General Soulouque, ascended the throne, proclaimed an empire, and assumed the title of Emperor Faustin I. In 1859, however, he was compelled to abdicate, and a republic was again proclaimed, with General Fabre Geoffrard as president. Since this period, no important change has taken place. The area of the Haytian republic is 11,718 square miles, and the pop. estimated at 500,000.

The word game at dice, without tables, which may be played by any number of persons. One person, called the caster (his opponent who bets with him being called the settler), takes the box and dice, and makes a throw (called a main), which must be followed by another (called 9); and if the second throw made is not within these limits, the caster must throw until such an one occurs. After the caster has thrown the main, he throws his own chance. The thrower, called the castor, has 12 cases, or called craps, as he likes, to throw the caster, except in the following cases. viz. 12 when 6 is the main, 11 when 7 is the main, or 12 when 8 is the main; in these cases, and also when the caster's throw is the same as the main, the throw is called a nick, and the caster wins. If his throw be not a nick, or a crab, then, if he can repeat the same throw before the main turns up, he wins. If the caster throws crabs, not nicks, or if he fails to repeat his throw before the main turns up, the settler wins the stakes. The settler, on the whole, has slightly the advantage of the caster, especially if 6 or 8 be the main, when his chance is to the caster's in the proportion of 7296 to 6961, or 22 to 21 nearly. Hazard is excluded as a game of calculation, and is never played merely with a view to amusement. Essentially an essay of calculations and combinations, requiring a cool and clear head to execute them, it has been an incitement to the slighter player under the name of 'hazard,' that ever laughed mathematicians to scorn. Hazard has been long a standing game at all the houses of play in Britain, in the face of a fact, that owing to the intricacy of the calculations of probabilities, the odds in favour of the professional player over the amateur are 100 per cent. In spirit, if not to the letter, it is the arithmetical dice.

Hazaribagh, the capital of the district of Rangur, in the sub-presidency of Bengal, stands almost midway between Calcutta and Benares being 239 miles to the north-west of the former, and 189 to the south-east of the latter, in lat. 24° N. and long. 85° 24' E. On the conquest of Scinde, H. was selected as the residence of the dethroned Amira.

Hazebrouck, a small but flourishing town of France, in the department of Pas-de-Calais, between the junction of the Calais and Dunkerque railways, 25 miles west-north-west of Lille. The parish church, built 1433–1520, is surmounted by a spire of 340 feet, and is, 213 feet high. Manufactures of linen and cloth, twine, leather, furniture, beer, oil, and lime, are carried on. A great linen market is held here every Saturday.
Hazard.—Head.

The larva of a weevil (Balalinas nucum) feeds on the kernels of hazel-nuts. The parent female, however, makes a hole by means of her long snout, and there deposits an egg. Great numbers of nuts are thus destroyed.

Hazard, William, a distinguished English essayist and miscellaneous writer, the son of a Unitarian clergyman. He was born in Kent, on the 10th April 1778. His father went to America with his family when H. was about five years of age, but returned in two years, and became pastor of a congregation at Weim, in Shropshire.

In 1793, H. became a student in the Unitarian college at Hackney, but did not take kindly to theological pursuits. In 1795, he left the college, and returned to his father's house, where he devoted himself to metaphysics and painting; about this time he met Coleridge, and by the conversation of the poet the seed was sown, as it were, of a keener intellectual life than he had befor known. In 1802, he visited Paris, and studied in the Louvre, and on his return he attempted to support himself by portrait-painting; but as he could neither please himself nor his patrons, he relinquished the ease, and threw himself into literature, for which he was much better adapted. In 1803, he went to London, and shortly after published his essay On the Principles of Human Action. In 1808, he married, and retired into the country. In 1811, he was again in London. In 1813, he delivered a course of lectures on the History of English Philosophy, and he subsequently delivered courses on the English Poets. He wrote essays in the Examiner in conjunction with Mr Leigh Hunt, which were afterwards republished in a volume entitled the Round Table. Other essays he collected into volumes, entitled Table-talk, and the Plain Speaker. He also published Character, a Sketch of the Platonist and the Spirit of the Age. In 1822, he was divorced from his wife, and two years afterwards married a second time. He died on the 18th September 1830. His last work was the Life of Napoleon, of whom he was an enthusiastic admirer. Since his death, a uniform edition of his principal works has been edited by his son.

The fame of H. rests upon his essays, which are in every sense remarkable. He exhibits great acuteness and penetration in his criticism, and every now and again a passage, by reason of passionate force and abrading, rises into the regions of poetry. On the whole, his essays are inferior to Lamb's and Hunt's, but the certain page is striking and memorable as any to be found in theirs.

HEAD. See Brain, Concession, Skull, Carotid Arteries, &c.

HEAD, Sir Edmund Walker, Bart, governor-general of Canada, was born in 1805, near Maidstone, Kent; educated at Oriel College, Oxford, where he was first class in classics in 1827, and became Fellow of Merton; succeeded his father, the seventh baronet, in 1838; was appointed assistant poor-law commissioner, and in 1841 became poor-law commissioner. After the breaking up of the poor-law board, he was, in 1847, nominated lieutenant-governor of New Brunswick. He held this post until September 1854, when he succeeded the Earl of Elgin as governor-general of Canada. He is the author of The Handbook of Spanish Painting, a Tour in the Manufactories of Duchess, &c. He has also written on several subjects, and has been a privy councillor in 1857, and K.C.B. (civil) in 1860.

HEAD, Sir Francis Bond, Bart, an author, and ex-governor of Upper Canada, was born at Hermitage, near Rochefort, in 1793. He entered the service of the Royal Engineers, and had attained the rank of captain, when, in 1825, he accepted an engagement...
HEAD BOROUGH—HEALTH.

from a private company to work some gold and silver mines on the river Plate. He crossed the Pampas from Buenos Ayres to Chili, and on his return to the United States published his "Recollections of the Pampas." He was made a major in the army in 1828; and in 1837, while holding the post of assistant-commissary of the army, on the urgent request of Lord Glenelg, then colonial secretary, he accepted the governorship of Upper Canada. He declared, in pursuance of his instructions, that an elective legislative council could not be granted, and that the crown reserves would not be abandoned, except on condition of an adequate and permanent civil list being voted. The House of Assembly stopped the supplies, as a means of obtaining redress for the alleged grievances of the province. If thereupon dissolved the House, and the result of the dissolution was in his favour. An insurrection, which had its origin, as it was said, in his injudicious measures, broke out. He had, with well-founded confidence in his own resources, sent away from Upper Canada the whole of the Queen's army; and putting himself at the head of the movement succeeded in suppressing the insurrection. In 1838, he resigned his post, and was created a baronet. He published a "Narrative," in answer to some severe strictures and imputations of rashness and misconduct, which, in his judgment, his Canadian administration had given rise. He has since devoted himself to literary pursuits. He has frequently appealed to the public upon the defenceless state of the country; he has also written "Hidalgo from the Branches of "it's "A Sagacity of Fugitive Sticks, A Visit to Ireland, The Emigrant, Life of Bruce the Traveller, &c.; he has also been a frequent contributor to the Quarterly Review, some of his articles in which have been reprinted.

HEAD BOROUGH, in England, is the head of a borough, or high constable, the latter name being now exclusively used. In Scotland, the words 'head borough' are used in another sense—viz., as the head borough in the county where the sheriff holds his court and exercises his jurisdiction.

HEAD COURTS, in Scotch Law, were the sheriff courts where the freemen did suit and summary matters, now abolished by the act 20 Geo. II. c. 43.

HEADACHE, a pain referred to the front, side, or back of the head, varying in intensity and other characters according to its cause and pathologcal relations. It is the most common variety of headache, and those which are dependent on, or connected with, derangements of the digestion, and frequently occur after meals. Such headaches are common among young persons, and especially young women leading lives of unnatural confinement within doors amid vitiated air. The subjects of this form of headache are usually pale and feeble, or delicate and easily flushed; they are often addicted either to sedentary occupations, or to balls, theatres, evening concerts, and other dissipations extending far into the night. The cure is so evident that it need not be insisted on as a matter of doctrine, but the practical application of the lesson is often difficult, owing to the blind devotion with which pleasure is often entertained by the natural desire of health. Very different is the form of headache caused in older persons, and mostly in men, by a 'flow of blood to the head,' in connection with threatened apoplexy. In this case, the habit is usually full, the complexion florid; giddiness is apt to come on in stooping, and the pain and sense of fulness and throbbing characteristic of the complaint, increase; in some cases, there is an approach to insensibility or double vision, as an additional warning. In these cases, gentle purgation and restricted diet, with exercise, will usually bring about a cure, unless there is positive organic disease. The periodic headache, or neuralgia, resulting from the pulsation of the head, i.e., half the head, otherwise called brose aume, is a curious variety which is closely connected with malaria (see Ague), and recurs at more or less regular intervals, affecting exactly half of the head up to the middle line. This kind is very acute, and is commonly under the control of quinine, which must, however, be given in considerable doses. The sick headache described by Fothergill is among the most distressing and intractable forms, inasmuch as it cannot usually be referred to any distinct removable cause, and is but little under the control of remedies. It is to be met, however, like the other forms, chiefly by a regulation of the whole habits of life, especially as regards habitual exercise, which may, indeed, be regarded as the great specific for all kinds of headache.

HEALDS, or HEDDLES, and HEALD MACHINES. In weaving, the threads of the warp are so arranged, that at each passage of the shuttle backwards and forwards, a certain number of the warp threads are raised up, and the remainder drawn down. This is done either by warp threads, or lines, with a small loop in the middle, through which the warp thread is passed, there being one of the vertical threads for each horizontal thread. These vertical threads are called healds; and as there is continual wear upon them, it is necessary they should be of considerable strength. They also require to be particularly smooth and round, in order that they may not, by their friction in moving up and down, choke the threads of the warp. Hence the manufacture of heald yarns is a peculiar one, and employs the chief attention of several manufacturers, particularly in the neighbourhood of Bradford, in Yorkshire, where they have been brought to great perfection by Messrs Townend Brothers and others. For some purposes, the healds are made of metal, and this class of healds is also a special manufacture. Machines have been invented for the purpose of making thread healds without knots, as the knot made by the loop is a great impediment to the free action of the heald. Such a machine was invented by Mr Judkins of Manchester. It is so constructed as to double and twist the warp yarn, and at certain intervals, let down the warp and plait the yarn forming the eye or loop of the heald without knot of any kind. By this machine a series of healds can be made in a continuous cord, only requiring to be cut into lengths for use. The same inventor also produced a machine which fits metallic eyes or loops in the heald.

HEALTH (from the same root as heal, hole, whole), the state of body or mind opposed to Disease (q. v.), and characterised by the integrity or soundness (Lat. sana) of all the parts and functions which constitute a living being. In the most restricted and ordinary sense, health is understood as referring chiefly to the body, and as indicating that perfect and harmonious play of all the functions which permits a man to be all that his Creator intended. Even in this sense, however, it may readily be admitted that absolute bodily health is one of the rarest of endowments; in common language, accordingly, the term is accepted with an indefinite limitation, to indicate a state consistent with military and physical prowess without any manifest and conclusive departure from the ideal standard.

As the absolute and extreme duration of human life is uncertain, it is usual to regard as a healthy state of the system that in which a moderate
HEALTH—HEART.

degree of activity, without pain or inconvenience, is maintained beyond the limit of threescore years and ten, as indicated by the Psalmist. In point of fact, however, no considerable community of human beings can be said even to approach this term of life on an average of cases. Even where the adult are more than commonly long-lived, there is always a considerable mortality at very early ages, which tends to reduce the statistical validity, so to speak, of the whole community below the age of thirty, as is indicated by an average of 70 years for the population of Scotland, as is shown in a population dying at the rate of only 15 in 1000 annually (the lowest permanent rate of in the returns of the registry-general for England), the average age at death of the community, supposing the population to be absolutely free from change, would be only 66; and in the case of a death-rate of 20 in 1000, the average age at death not used, the death-rate of 25 in 1000 (the actual death-rate of London, the healthiest of the great European capitals) would correspond to an average age at death of not more than 40. Setting aside fluctuations of population, which always exercise a certain influence on the result of such calculations, it may be said that the average duration of life in England and Wales is about 45 years, and in Scotland somewhat less than 50 years; and to the extent of about 30 or 35 years, these two great countries falls short of the ideal standard. This subject will be more fully considered under the article VITAL STATISTICS, in which a view will be given of the phenomena of the death-rate, as affecting the calculation of premature mortality, with a view to the removal of its causes in great communities. This department of science has assumed great importance of late years, in consequence of the efforts that have been made to improve the sanitary condition of our towns and great towns and villages by improved drainage and sewerage, a regulated supply of pure water, and the inspection, in certain circumstances, of lodging-houses, and even of private dwellings, so as to prevent overcrowding, and the other manifest causes of the spread of epidemic disease. These, and other great practical reforms, constitute the object of what has been called the 'Public Health' movement in this country, some notice of the history, progress, and practical results of which will be given under the head of SANITARY SCIENCE.

HEALTH, BILL OF, in Scotch Law, means an application by a prisoner to be allowed to live out of the prison, on the ground of ill health. The application is now made to the county prison board, and if allowed, the prisoner is taken to a neighbour house, and kept under surveillance. The same thing is done in England under the Prison Regulation Acts, though the phrase bill of health is not used therein.

HEALTH, BILL OF, in Shipping, means a certificate of a consul, &c., as to the health of the crew, when the ship has come from a suspected port. A clean bill, a suspected bill, and a foul bill, are the three short names given to the several degrees of health.

HEARING. See EAR.

HEARING IN PRESENCE, in the Law of Scotland, means a hearing of a difficult or important case before the whole of the thirteen judges of the Court of Session. It is competent for either division of the Court of Session, when equally divided in opinion on a case, to appoint a hearing before the whole judges, which is in fact a reargument. In England, it is not in general competent for any court, when equally divided, to order a case to be argued before all the other courts sitting together. The only case in which it occurs is where the Court of Criminal Appeals has heard a case, and the judges differ considerably, or think it a very important case, when it is ordered to be argued before the full court, and to be heard by the fifteen common law judges. It is then called a hearing before the full court.

HEARING OF A CAUSE is the phrase used in the Court of Chancery, when the merits of the case and the arguments on both sides are entered upon. The same phrase is used in cases tried in Scotch magistrates. But at common law, if it is a jury case, the corresponding term is 'the trial'; and if it is a case before the judges in banc, it is called 'the argument.' In Scotland, it is called 'the debate,' if before the judges; if before the jury, 'the trial'.

HEARSAY EVIDENCE is the name given by lawyers to evidence given in a court of justice at second-hand, where the witness states not what he himself saw or heard, but what somebody else said. This evidence is, as a general rule, inadmissible, because the axiom is, that the best evidence that can be had must be produced, and therefore each witness must be confined to stating what he knows of his own personal knowledge, or what he has learned by the use of his own senses, and sworn to the truth, his truthfulness is thus secured, as far as human testimony can be so. If evidence were once admitted at second-hand, there would be no limit to its uncertainty, and there would be thus introduced a heterogeneous mixture of things, which, not being sworn when they made them, are therefore incapable of being punished if they speak falsely, and cannot be cross-examined. Though such is the general rule, yet there are a few exceptions which are unavoidable, owing to the nature of the thing. Thus, in proving pedigrees, the hearsay evidence of persons connected with the family, and those only, is admitted in England; but in Scotland it is admitted though the persons were not connected with the family. A remarkable exception also exists in the case of dying declarations, i.e., statements made by persons mortally wounded and in the prospect of death; but in England such evidence is only admitted in criminal cases, on a charge of manslaughter or murder. In Scotland, such declarations are admitted in all cases of violence, and though the party at the time did not believe he was dying, there is another exception to the non-admissibility of hearsay evidence admitted in Scotland, viz., where the person who made the statement is dead, and therefore cannot be produced as a witness. In England, there is no help for such a state of things, and the statements of the dead person cannot be admitted; but in Scotland, if there was no reason to suppose the contrary, it is presumed the dead witness spoke the truth, and what he said may be given in evidence for what it is worth, both in civil and criminal cases. A few other exceptions, of a less important description to the above general rule, exist in both countries, which are too technical to be here noticed.

HEART. See CIRCULATION OF THE BLOOD.

HEART, DISEASES OF, a class of serious, and often fatal disorders affecting the great centre of the circulation, the accurate knowledge of which may be dated from the application of Anseautation (q. v.) and Percussion to the purposes of diagnosis. The great names of Corvisart and Laennec stand foremost in the history of investigation of these diseases, Dr Hope of London, and a great number of living physicians, having largely contributed to the existing knowledge of the subject, which had, however, been carefully studied by Morgagni and the great morphological anatomists of the 18th c., as well
HEART.

as by Mr. and Mrs. Vesta, without the advantage of the most effective means of diagnosis. The limits of this article admit of only a very slight sketch of a subject of vast extent, and on which the literature of the last fifty years is unusually copious and exhaustive.

The diseases of the heart may be roughly divided into the functional and organic—in the former of which no appearances adequate to account for the symptoms are found in the dead body, while in the latter the fact is the true cause, and belong simple palpitation, syncope, and the peculiar disorder termed angina pectoris; to the latter, hypertrophy of the heart, dilatation of the cavities, with various structural diseases of the endocardium and pericardium, of the muscular fibre, and of its nutrient vessels. To these may be added the diseases of the aorta, and especially aneurisms of its thoracic portion. We propose to review very briefly these different morbid conditions.

Palpitation, or undue and often irregular action of the heart, attended by uneasy sensations of movement, is a disorder common to many organic diseases of the heart, and not infrequently also occurring in delirious states of the system, without any organic disease whatever. In exhausted and anxious men of business, in hysterical and anemic women, in habitual smokers, and dyspeptics, in persons debilitated by discharges from the mucous membranes, a degree of palpitation is quite common, and the symptom sometimes assumes the apparent form of an independent disease, especially when aggravated by mental anxiety in respect to its true significance. The treatment is entirely guided by the facts of the individual case; but generally speaking, the negative results of physical diagnosis, with the positive knowledge of the cause, suffice to reassure both practitioner and patient, and lead to a correct adaptation of means to the end in view.

Syncope, or swooning, is, as every one knows, much more commonly a functional than an organic disease. See Fainting.

Angina pectoris, or breast-pang, also called syncope anginosum, is a peculiar painful or oppressive sensation, very characteristic of cardiac diseases, especially of such as are apt to prove suddenly fatal. It is needless to add that this form of disease is of great importance, and of very dreadful significance. The two leading elements in the sensation referred to, according to Dr. Latam, are the pain and the sense of impending death. The sensation is entirely different from breathlessness, although often mixed up with this in the mind of the patient. Where the sudden death-like paroxysm of angina comes on in the absence of medical assistance, the proper remedies are, warmth to the extremities, stimulants, and moderate doses of laudanum or opium; but no time should be lost in procuring the aid of instructed persons, as errors in the administration of these powerful remedies might be more rapidly fatal than the disease itself.

Asthma, and difficulty of breathing depending upon the lungs, especially that form of difficult breathing called orthopnea, when the patient is unable to lie down in bed, are symptoms very characteristic of some kinds of disease of the heart and of the lungs.

The organic diseases of the heart are very numerous; most of them are attended by one or other of the symptoms above mentioned, and almost all of them are more or less liable to life threatening.

It is nevertheless true that public opinion, now-a-days, is prone to overrate the tendency to death, and especially to sudden death, in some of these diseases. Strictly speaking, a sudden death—i.e., a death quite unexpected, and in the midst of apparent good health—is a rare and exceptional fact in organic disease of the heart; the most frequent instances being in connection with Anemias (q.v.) of the great vessels, fatty degeneration of the heart's fibre, and extensive calcareous degeneration of the coronary arteries of the heart, often producing marked symptoms of angina pectoris, as above referred to.

The vascular diseases of the heart are among the most frequent and the most easily recognizable of its organic disorders. They depend essentially upon changes in the endocardium, or internal lining membrane (endocarditis); in many cases these changes originate in attacks of rheumatic fever (see Rheumatic), which is therefore to be viewed with suspicion as a disease tending to shorten life, especially when developed during early youth. The valves affected are usually those of the left side, and the consequence may be either imperfect closure of the valve, leading to regurgitation of blood, or obstruction of the orifice. In either case, there is a mechanical impediment to the circulation, of a more or less serious kind, followed by dilatation of the cavities of the heart and hypertrophy of the walls, especially of the left side. This condition is kept up under these unfavourable conditions by increased efforts of the organ; but ultimately its balance is fatally disturbed, blood accumulation is increased, the larvae of the internal organs, and secondary diseases take place, of which Dropsey (q.v.), Albuminuria, and Haemoptysis, or spitting of blood, are among the most frequent and formidable.

Pericarditis on the usual case of the pericardium, i.e., the heart-purse, or fibrous sac investing the heart, is, like endocarditis, a frequent consequence of acute rheumatism. In numerous instances, it ends favourably, but in some cases it is fatal by large exudation or spread of the membrane between the external membrane and the heart.

The treatment of all these diseases must be strictly regulated by medical advice.

HEART, SOUNDS OF. On applying the ear to the cardiac region of a living man or mammal in a state of health, two successive sounds are heard, each pair of which corresponds with one pulsation. These are known as the first and the second sound. There is scarcely any interval between these two sounds, especially in the second one following immediately upon the conclusion of the first; but after the second sound there is a perceptible pause before the first sound is again heard. The first sound is dull and prolonged, while the second is short and sharp, and the difference between them is well expressed (as Dr. C. R. Williams has remarked) by articulating the syllables lub, dib. The cause of the first of these sounds has been a subject of much discussion, at least thirty explanations of its mode of production having been offered. During the first sound, several distinct actions are taking place, to each of which it has been ascribed by different physiologists. Thus we have had the unison of the anterior leaflet of the heart against the side of the chest; (2), the contraction of the muscular walls of the ventricles; (3), the tension of the auriculo-ventricular (tricuspid and mitral) valves (see Circulation). For the rush of blood through the narrowed openings of the aorta and pulmonary artery; and (5), the collision of the particles of blood with one another, and their friction against the sides of the heart's cavities.

The sounds of a heart make at least as interesting an exhibition to our own, give out sounds different in degree, but not in character, from the sounds heard in man. In birds (if we except the ostrich and the super
HEARTH-MONEY—HEAT.

whose hearts approximate to the mammalian type, there is no perceptible difference between the first and second sound; and Dr Haldew has ingeniously explained why this should be in his essay on The Action and Sounds of the Heart. The sounds of the heart in reptiles (the alligator, python, and turtle) seem to be accompanied with no definite sounds.

When the valves are changed by disease, the sounds undergo special alterations, which are of the highest importance in diagnosis.

HEARTH-MONEY, an old tax in England, abolished by 1 Will and Mary, a 1, c. 10.

HEAT, the unknown cause of the sensation of warmth produced by a multitude of agents, appears also caused, in nature and art. In considering this subject scientifically, it is necessary, at the outset, to discard the ideas conveyed by the popular use of such words as heat and cold. A number of bodies, however different, left for a long enough time in the same room, must, as we shall see further on, acquire the same temperature, or become in reality equally warm. Yet in popular language, some, as metals, stones, &c., are pronounced to be cold, and others, as glass, earth, are said to be warm. The name, then, is not a means by which we can acquire any definite idea of the temperature of a body.

Nature of Heat.—A heated body is no heavier than before, since it was heated; if, therefore, heat be a material substance, as it was long considered, it must be imponderable. And, in fact, under the name of caloric or phlogiston, it is classed, in almost all but modern treatises, as one of the family of undecomposable, if not material, bodies. But if it were matter, in any sense of the word, its quantity would be unchangeable by human agency. Now we find that there are cases in which heat is produced in any quantity without flame, combustion, &c., as in melting two pieces of ice, for instance. Yet if it were matter, in any sense of the word, its quantity would heat totally disappears. This is utterly inconsistent with the idea of the materiality of heat. The only hypothesis that at all accords with the phenomena is, that heat is a form of energy, and that this idea we shall start.

Measure of Heat.—Whether it be a vibration, such as light and sound (in some cases, it certainly is), or consist in a succession of impacts of the particles of bodies on each other (as in some cases, it has been considered to be), it is equally certain that the amount of heat in a body is to be measured by the vis-viva (see Force) of moving particles. But as we cannot observe those particles so as to ascertain their vis-viva, we must have some means of measuring the temperature of a body, depending upon an effect of heat. Whatever that effect may be, it is obvious that, as the laws of nature are uniform, it will afford us a reproducible standard, by which we can estimate its amount at any time and in any place, and compare that amount with another observed somewhere else; just as the French Mètre (q. v.) is reproducible at any time, being the ten-millionth part of a quadrant of the meridian.

Dilatation or Expansion.—Now, the most general and notable effect which heat produces on matter is to expand it. The length of a metallic bar varies with the change of temperature, and is ever the same at the same temperature. The fixing of the tire of a cart-wheel is a very good instance. No hammering could fit an iron hoop so tightly on the woodwork of the wheel, as the simple enlarging of the tire by heat. But a subsequent touch by cold is it thus possible to slip it on, and an enormous force is secured to bend the pieces together. In almost every kind of structure, the expansion and contraction from changes of temperature require to be guarded against. In the huge iron tubes of the Britannia Bridge, the mere change of the seasons would have produced sufficient changes of length to tear the piers asunder, had each end of a tube been fixed to masonry. Watches and clocks, when not compensated (see Peculiarity), go faster in cold weather, and slower in hot, an immediate consequence of the expansion or contraction of their balance-wheels and pendulums.

If a flask, as a water-dial, be dipped into hot water or held over a lamp, a portion of the liquid runs over; a glass shell which floats in a vessel of water, sinks to the bottom when the water is heated; and as water is heated, the hotter water continually rises towards the surface. In an open latticework, if we do not the case, it would be impossible to prevent explosions every time we attempted to heat water or any other fluid. If a bladder, partly filled with air, and tightly tied at the neck, be heated before a fire, the contained air will expand, and the bladder will be distended. As it cools, it becomes flaccid again by degrees.

These and like instances are sufficient to show us that in general all bodies expand by heat. In order, then, to prepare a reproducible means of measuring temperature, all we have to do is to fix upon a substance (mercury is that most commonly used) by whose changes of volume it is to be reproducible, and observe two reproducible temperatures, at which to measure the volume. Those usually selected are—that at which water freezes, or ice melts, and that at which water boils. In both of these cases, the water must be pure, and any addition of foreign matter in general changes the temperature at which freezing or boiling takes place. Another important circumstance is the height of the barometer. See Boiling.

The second reproducible temperature is therefore defined as that at which a thermometer which is a heat or Thermometer on these principles, the various ways of graduating it, and how to convert the readings of one thermometer into those of another, are described in the article Thermometer. In the present article, we suppose the Centigrade thermometer to be the one used.

If we make a number of thermometer tubes, fill them with different liquids, and graduate as in the Centigrade, we shall find that all give 0° in freezing, and 100° in boiling water, no two in general agree when placed in water between those states. Hence the rate of expansion is not generally uniform for equal increments of heat. It has been found, however, by very delicate experiments, which cannot be more than alluded to here, that mercury expands nearly uniformly for equal increments of temperature. However, what we sought was not an absolute standard, but a reproducible one; and mercury, in addition to furnishing this, may be assumed also to give us the ratios of different increments of temperature.

We must next look a little more closely into the nature of dilatation by heat. And first, of its measure. A metallic rod of length L at 0°, increases at t° by a quantity which is proportional to t and to L. Hence k being some numerical quantity, the new length L = (1 + kt). Here k is called the coefficient of linear dilatation. For instance, a brass rod of length 1 foot at 0°, becomes at t°, (1 + 0000001871) feet; and here k, or the coefficient of linear dilatation for one degree (Centigrade), is 0000000187; or a brass rod has its
HEAT.

length increased by about \( \frac{1}{5,000,000} \) part for each degree of temperature.

If we consider a bar (of brass, for instance) whose length, breadth, and depth are \( l, b, d \), then when heated, these increase proportionally. Hence,

\[ V = l(l + \alpha \cdot l), \]
\[ V' = b(l + \alpha \cdot l), \]
\[ d' = d(1 + \alpha \cdot d); \]
and therefore the volume of, or space occupied by, the bar increases from \( V \) to \( V' \) or \( V + \alpha \cdot V \).

Hence \( V' = V(1 + \alpha) \) nearly, since \( k \) is very small.

Therefore we may write \( V' = V(1 + \alpha) \), where we shall have as before, \( K \), the coefficient of cubical dilatation for 1° of temperature. And, as \( K = \alpha \), we see that, for the same substance, the coefficient of cubical dilatation is three times that of linear dilatation.

In the following table, these coefficients are increased a hundredfold, as it gives the proportionate increase of volume for a rise of temperature from 0° to 100° Centigrade. It must also be remarked, that while the linear dilatation required to heat it is the cubical dilatation of liquids and gases which is always observed. Moreover, as the latter are always measured in glass, which itself dilates, the numbers are only apparent; they are too small, and require correction for the cubical dilatation of glass. This, however, is comparatively very small, and may in general be neglected.

There is one remarkable exception to the law that bodies expand by heat — viz., that of water, under certain circumstances. From 0° (Centigrade), at which it melts, it contracts as the heat is increased, up to about 4° C., after which it begins to expand like other bodies. We cannot here enter into speculations as to the cause of this very singular phenomenon, but we will say a few words about its practical utility. Water, then, is densest or heaviest at 4° C. Hence, in cold weather, as the surface-water of a lake cools to near 4°, it becomes heavier than the hotter water below, and sinks to the bottom. This goes on till all the lake has the temperature 4°. As the cooling proceeds further, the water becomes lighter, and therefore remains on the surface till it is frozen. Did water not possess this property, a severe winter would freeze a lake to the bottom, and the heat of summer might be insufficient to remelt it all.

Specific Heat.—The thermometer indicates the temperature of a body, but gives us no direct information as to the amount of heat it contains. Yet this is measurable, for we may take as our Unit the amount of heat required to raise a pound of water from 0° to 1°, which is of course a definite standard. As an instance of the question now raised — Is more heat (and if so, how much more) required to heat a pound of water from zero to 10°, than to heat a pound of mercury between the same limits? We find by experiment that bodies differ extensively in the amount of heat (measured in the units before mentioned) required to produce equal changes of temperature in them.

It is a result of experiment (sufficiently accurate for all ordinary purposes) that if equal weights of water at different temperatures be mixed, the temperature of the mixture will be the arithmetic mean of the original temperatures. From this it follows, with the same degree of approximation, that equal successive amounts of heat are required to raise the same mass of water through successive degrees of temperature. As an instance, suppose one pound of water at 50° to be mixed with two pounds at 20°; the resulting temperature of the mixture is 30°; for the pound at 50° has lost 20°, while each of the other two pounds has gained 10°. Generally, if \( m \) pounds of water at \( t \) degrees be mixed with \( M \) pounds at \( T \) degrees (the latter being the colder), and if \( T \) be the temperature of the mixture, the number of units lost by the first is \( m(t - T) \), since one is lost for each pound which cools by one degree; and that gained by the second is \( M(T - t) \); and these must be equal. Hence \( m(t - T) = M(t - T) \), whence, at once,

\[ m = M \]

But if we mix water and mercury at different temperatures, the resulting temperature is found not to agree with the above law. Hence it appears that to raise equal weights of different bodies through the same number of degrees of temperature, requires different amounts of heat. And we may define the specific heat of a substance as the number of units of heat required to raise the temperature of one pound of it by one degree.

By the definition of a unit of heat, it is at once seen that the specific heat of water is unity; and, in general, the specific heats of other bodies are less, and are therefore to be expressed as proper fractions. For the general equation of weights of water and mercury be mixed, the first at 0°, the second at 100°, the resulting temperature will not be 50° (as it would have been had both bodies been water), but \( 3\cdot2^3 \) nearly — in other words, the amount of heat which raises the temperature of 1 pound of water, to the extent that which would raise that of 1 pound of mercury 96°-77, or the specific heat of mercury is \( 3\cdot2^3 \)th of that of water. The following may be given as instances of the great differences which experiment has shown to exist among bodies in respect of specific heat:

It is mainly to the great specific heat of water that we are indebted for the comparatively small amount of it required to cool a hot body dropped into it; for its comparatively small loss of temperature when it is poured into a cold vessel, and the enormous effects of the water of the ocean in modifying the climate of the globe. It has been found generally, with a few exceptions, that the specific heats of bodies are nearly inversely as their Atomic Weights (q.v.). Hence all bodies require the same amount of heat to produce the same change in their temperature. Thus, if the same bodies, we have atomic weight of mercury, 100; its specific heat, 0.933; product, 3.3; atomic weight of iron, 23; its specific heat, 0.114; product, 2.62. A similar remark may be made, it appears, with reference to compound bodies of the same type: but, in general, the product of the specific heat and the atomic weight differs from one type to another.

Latent Heat, Fusion, Solution, and Vapourisation.

—We are now prepared to consider the somewhat complex effects produced by heat on the molecular constitution of bodies; and, conversely, the relations of solidity, fluidity, &c., to heat. All bodies (except carbon, which has been softened only) have been melted, by the application of a proper amount of heat. The laws of this fusion are:

1. Every body has a definite melting point, assignable on the thermometric scale, if the pressure to which it is subjected be the same.

2. When a body is melting, it retains that fixed temperature, however much heat may be applied, if and
HEAT.

The last particle is melted. The last result is most remarkable. The heat applied does not raise the temperature, but produces the change of state. Hence it seemed to disappear, as far as the thermometer is concerned, and was therefore called latent heat.

A pound of water at 70° C. added to a pound of water at 0° C., produces, of course, 2 pounds of water at 35° C. But a pound of ice at 0° C., produces 2 pounds of water at 0°. Heat, then, has disappeared in the production of a change from solidity to fluidity. And this we might expect from the conservation of energy (see Force). For actual energy in the shape of heat must be consumed in producing the potential energy of the molecular actions in the fluid. For every pound of ice melted, without change of temperature, 790 units of heat are thus converted into change of molecular arrangement.

We give a few instances of latent heat of fusion:

Water (as above), 790; zinc, 281; sulphur, 94; lead, 54; mercury, 28.

In law 1, it is mentioned that constancy of pressure is necessary. In fact, the freezing (or melting) point of water is lowered by increase of pressure, while those of sulphur and wax are raised; but these effects, though extremely remarkable, are very small.

Thus, a severe frost setting in after copious rain splits rocks, &c., by the expansion of freezing water; and thus also we obtain in iron the most delicate and accurate of gauges, in the fusion or casting of alloys a clear-cut copy of a type. The modern dynamical theory of heat enables us to see that a perpetual motion would be procurable, if bodies which contract on solidifying had their melting point to rise very gradually.

Analogous to the fusion of a solid is its solution in a liquid, or the mutual conversion into liquids of two solids which are intimately mixed in powder. Here, also, we should expect actual energy in the shape of heat, to be used up in producing the potential energy of the fluid state; and, indeed, such is always the case. Such changes of arrangement destroy heat, or produce cold; but this in many cases is not the observed, as heat is generally developed by the loss of potential energy, if there be chemical action between the two substances. Hence, in general, the observed effect will be the difference of the heat generated by chemical action, and the solidifying; some of this heat being latent.

If a quantity of pounded nitrate of ammonia (a very soluble salt) be placed in a vessel, an equal weight of water added, and the whole stirred for a minute or two with a test-tube containing water, the heat required for the solution of the salt will be abstracted from all bodies in contact with the solution, and the water in the test-tube will be frozen. In this sense, the compound is called a freezing mixture. For additional illustrations of heat becoming latent, see FREEZING MIXTURES.

Of course the converse of this may be expected to hold, and latent heat to become sensible when a liquid becomes solid. As an example, when a satisfactory copy of one of those bottles which deposit crystals of the salt, the temperature rises very considerably; and it is the disengagement of latent heat that renders the freezing of a slow process, even after the water has been reduced nearly to the freezing-point.

Vaporation.—Almost all that has been said on the subject of fusion is true of vaporsation, with the change of a word or two. Thus, however much heat we apply to liquid water, it never does not rise above the boiling-point. Heat, then, becomes latent in the act of vaporisation, or rather is converted into change of state. It is found by experiment that 540 units of heat (each sufficient to raise a pound of water 1° C.) disappear in the conversion of a pound of water into steam. Hence a pound of steam at 100° C. is sufficient to raise 5-4 pounds of water from zero to the boiling-point.

Communication of Heat.—There are at least three distinct ways in which this occurs, and these we will take in order.

Conduction.—Why is it that if one end of a poker and of a glass or wooden rod be put into a fire, we can keep hold of the other end of the latter much longer than we can of the former? The reason is, that heat is more readily transmitted in the iron from particle to particle, than it is in glass or wood. This is conduction. It is to be noticed, however, that in this experiment a great portion of the heat which passes along each rod is given off into the air by the surface. The mathematical theory of conduction has been most distinctly investigated by Fourier, and after him by Poisson, but on the supposition that the rate at which heat passes from a warmer to a colder portion of a body is proportional to the difference of temperature. As most of the experiments which have been made with the object of ascertaining the value of this law of conductivity (most commonly known in common use) of different bodies have been made in this way, it is not surprising that our knowledge on this point is very meagre indeed. We know that silver conducts better than most metals, and that the metals in general conduct better than other solids; but here our present information ends. It is satisfactory to know, however, that the defects of the old methods are now fully acknowledged, and that the important element of conductivity will shortly be accurately known for all important substances.

Forbes has recently shown that the conductivity of iron diminishes as its temperature increases; and the same is probably true of other bodies. This invalidates the conclusions of the mathematical theories above mentioned, but the necessary corrections will be easily applied when the experimental data are completely determined.

In conjunction with their resisting power (see next section), the conductivity of bodies is most important as regards their suitability as articles of clothing for hot or cold climates, or as materials for building or furnishing dwelling-houses. We need but refer to the difference between linen and cotton clothing, or to the difference (in the same weather) of sensation between a carpet and a bare floor, in order to shew how essential the greater or less conducting power of bodies is to our everyday comfort.

Radiation.—By this is understood the passage of heat, not from particle to particle of one body, but through air or vacuum, and even through solid bodies (in a manner, and with a velocity quite different from those of conduction) from one body to another. There can be no doubt whatever as to radiant heat being identical with light, differing from red light, for instance, as red light differs from blue; i.e., having (see Light) longer waves than those corresponding to red light. This idea might easily have appeared during the conduction of a body gradually heated. At first, it remains dark, giving off only rays of heat; as its temperature increases, it gives us, along with the heat, a low red light, which, with the increase of the temperature, is gradually accompanied by yellow, blue, &c., rays, and the incandescent body (a lime-ball, for instance) finally gives off a light as white as that of the sun, and which, therefore, contains all the colours of the usual spectrum. That (see Force), there is great reason to believe that
HEAT.

The sun is merely a mass of incandescent melted matter, and that the radiations it emits, whether called heat or light, merely differ in quality, not in kind. Taking this view of the subject at the outset, it will be instructive to compare the properties of radiant heat with those of light throughout.

The thermal, or (generally) straight light, is this. It is easily verified in the case of heat by the use of the Thermo-electric Pile (q. v.) and its galvanometer, and by placing the pile out of the line from a source of light, the emf is zero, no effect is observed; but deflection of the needle at once occurs when the pile is placed in the line which light would have followed if substituted for the heat.

A concave mirror, which would bring rays of light proceeding from a given point to a focus at another given point, does the same with heat, the hot body being substituted for the luminous one, and the pile placed at the focus. Heat, then, is reflected according to the same laws as light. A concave mirror gives a capital proof of the transmission of heat and light being subject to the same laws of refraction.

When the Solar Spectrum (q. v.) is formed by means of a prism of rock-salt (the reasons for the choice of this material will afterwards appear), the transparent layer proves the existence of heat in all the colourless spaces, increasing, however, down to the red end of the spectrum, and attaining its maximum beyond the visible light, just as if heat were (it must be) light with longer waves.

Some bodies, as glass, water, &c., transmit, when in thin plates, most of the light which falls on them; others, as wood, metal, coloured glass, &c., transmit none or little. A plate of rock-salt, half an inch thick, transmits 96 per cent. of the rays of heat which fall on it; while glass, even of a thickness of one-tenth of an inch, transmits very little. In this sense, rock-salt is said to be diathermanous, while glass is said to be adiathermanous, or only partially diathermanous. Most of the supergases, such as oxygen, hydrogen, &c., and mixtures of these, such as air, oppose very little resistance to the passage of radiant heat; but the reversing is the case with compound gases. Some recent experiments by Tyndall seem to show that the vapour of water is exceedingly adiathermanous. The question, however, cannot be considered as finally settled, since some of Tyndall's results are so startling as to require further research and confirmation.

But there are other remarkable phenomena of radiant heat easily observed, which have their analogy in the case of light. 1. Unstained glass seems equally transparent to all kinds of light. Such is the case with rock-salt and heat. 2. Light which has passed through a blue glass (for instance) loses far less per cent. when it passes through a second plate of blue glass. Similarly, heat loses say 75 per cent. in passing through one plate of crown-glass, and only 10 per cent. of the remainder (say) in passing through a second. 3. Blue light passes easily through a blue glass, which almost entirely arrests red light. So dark heat passes far less easily through glass than bright heat does. These analogies, mostly due to Melloni, are very remarkable.

Again, light can be Doubly Refracted, Plane Polarized, Circularly Polarized. All these properties have been found in heat by Principal Forbes (q. v.).

The investigations of Stokes and Kirchhoff on the solar spectrum have shown us that bodies, which most easily absorb light of a particular colour, when heated, give off most freely light of that colour; and it is easily shewn by experiment, that those substances which absorb heat most readily, also radiate it most readily. Thus, it was found by Leslie, that when a tinnel-iron cube full of boiling water had one side polished, another roughened, a third covered with lampblack, &c., the polished side radiated little heat, the roughened, more, while the blackened side radiated a very great quantity indeed. And again, if we have (say) three similar thermometers, and if the bulbs be (1) gilded, (2) covered with roughened metal, (3) smoked, and all be exposed to the same quantities of heat, their sensitivities will be in the order 3, 2, 1. A practical illustration of this is seen in the fact, that a blackened kettle is that in which water is most speedily boiled, while the water kept warm when removed from the fire. Again, if a willow-pattern plate be heated white-hot in the fire, and then examined in a dark room, the pattern will be reversed—a white pattern being seen on a dark ground. This experiment of Kirchhoff is very remarkable, and virtually constitutes an anticipation of the Theory of Exchanges, first enunciated by Dulong and Petit, and greatly extended and carefully verified by Stewart, which is to this effect: 'Every body is continually radiating heat in all directions, the amount radiated being (nearly) proportional to its own temperature.' Hence the apparent radiation of coal (in the experiments above mentioned) is due to the fact of the pile or thermometer radiating off more heat than it receives, as its temperature is higher than that of the freezing mixture to which it is opposed. Fredrich found that any number of bodies left near each other, tend gradually to assume a common temperature. By this theory of exchanges, we explain the cold felt in sitting opposite a window in a frosty day, even when there is no draught.

Convection.—A hot body cools faster in a current of air than in a still atmosphere of the same temperature, evidently because fresh supplies of the colder air are continually brought into contact with it. It is by convection mainly that heat is conveyed from the bottom of a vessel of water, the heat does not diffuse itself in the water as it would (by conduction) in a mass of matter below the heated water at the bottom rendering it lighter, bulk for bulk, than the superincumbent fluid, causes it to rise to the surface; and thus, by convection, the heat is diffused through its mass. Conduction, properly so-called, can scarcely
HEATH—HEAVEN.

be shown, even if it really exist, in liquids or gases, on this account. The tremulous appearance of any object, as seen by light which passes near a hot surface, as that of a boiler or a red-hot poker, is due to the convection of heat in the air, the warm current refracting light less than the cold air. See VENTILATION.

For the mechanical applications of heat, see STEAM ENGINE, CALORIC ENGINE, &c.

Sources of Heat. They may be, so far as we know, ultimately reduced to two—chemical combustion, and mechanical force; and, indeed, in all probability, the former is only a variety of the immensely different forms in which the latter is manifested. A more full examination of this point, and a general statement of the ultimate nature of the various sources of heat, will be found in the article FORCE above referred to. See also COMBUSTION, FUEL.

HEATH (Erica), a genus of small shrubs of the natural order Ericaceae (q.v.), distinguished by a calyx of four leaves, a bell-shaped or ovoid—often vestigial—corolla, and a 4-celled, 4-valved capsule, with dissepiments from the middle of the valves. The leaves are small, linear, and evergreen. The genus, as thus defined, has been broken down by some botanists into a number of genera, but the old name, Erica, is still more commonly retained. The name H., however, is, in popular language, extended to many plants of genera nearly allied to Erica; and the little shrub which chiefly covers the large tracts named moors or heaths (Ger. Heide) in Britain and on the continent of Europe is Calluna vulgaris (fig. 3). The genus Calluna has been separated from Erica, chiefly on account of differences in the capsule, and of the presence of four bracts resembling an outer calyx. C. vulgaris, the common Linear or Heath, is the only species known. It is found on arid places, and also in bogs. The flowers have much the appearance of being in spikes; they are of a lilac rose colour, rarely white. The various depth of colour in the flowers of different plants adds much to the beauty of a hillside covered with H. in the end of August. The flowers afford abundance of honey, and bees are therefore transported to the moors when the heather is in bloom. In bogs, it contributes much to the formation of peat. In some of the Hebrides, a decoction of H. is used for tanning leather. The plant is applied to various uses in the Highlands of Scotland. Cottages are often thatched with it, and parts of the peat are mostly built of it, in layers with the roots inward, and mixed with earth and straw. Beds are also made of it, placed in a sloping direction with the tops upwards, and are said to be very soft and elastic. Bosoms, and scrubble-brushes, are made of it. In the island of Islay, ale is made by brewing one part of malt and two of the young tops of heather; and this is supposed to be the same beverage which was anciently used by the Picts.—Of the genus Erica, about 500 species are recognized; and these, with few exceptions, are natives of the south of Africa. None are found in America. The British Isles produce seven species, of which some have only been found in Ireland, and some in the south-west of England. CROSS-LEAVED H. (E. tetralis) (fig. 2) and FINE-LEAVED H. (E. cinerea) (fig. 1) are common plants in most parts of Britain, and like most of the genus, are very beautiful when in flower. The heather-bells of Scottish songs are the flowers of one or both of these species. A sprig of E. cinerea was the badge of the Macdonalds at the time when they existed as a distinct clan. E. Mediterranean and E. carnea, common in the southern parts of Europe, are remarkable ornaments of British flower-borders, hardy plants, producing their flowers in great profusion in April. Many species, remarkable for the size and beauty of their flowers, are much cultivated in greenhouses; and heath-houses are sometimes erected for the special purpose of their cultivation. Some of the South African or Cape heaths attain in their native region a much greater size than any European H. except E. tetralis, which in the Alps sometimes grows to the height of twenty feet.

HEATH. The burning or setting fire maliciously to a heath in England is felony, and is punished by imprisonment for three years or less. The offence is technically called Arson, being one of its varieties. In Scotland, the offence is called Muirburn (q.v.).

HEAVEN, in popular Physical Science, means the expanse which surrounds the earth, and which to a spectator on the earth's surface appears as a vast arch or vault, in which are seen the sun, moon, and stars. The earliest idea entertained of this expanse was of a solid vault or hemisphere with its concavity turned downwards (see Firmament).—In Theology, the word heaven may be explained to mean that portion of the infinite space in which the Lord of all things, although present throughout all, is supposed to give more immediate manifestations of His glory. Of the belief in the existence of some such special scene of the presence of the Deity, most of the known religions of the world, ancient and modern, present abundant evidence. Aristotle declares that all men, whether Greeks or barbarians, have a conception of gods; and all agree in placing the habitation of the gods in the most elevated region of the universe. Plato is equally explicit. Even Epicurus teaches the same doctrine; and one of the treatises described from the papyri of Herculaneum is a treatise by him, in which the position and the other characteristics of the habitation of the gods are minutely discussed. The same may be said of the Persian, the Egyptian, the German, the Scandinavian, and in general of all the ancient religions in which the belief of the existence of a supreme being assumes any other form than
of such religions plainly founded upon the contrary supposition. In addition, however, to the idea of its being the special scene of God's glory, the word heaven also designates the place, or the state or condition, of the blessed spirits, and of the souls of just men who are admitted into the participation or the contemplation of the divine beatitude. In the religious system of the Greeks and Romans, none were supposed to be admitted to the beaten of the gods except the deified heroes or demi-gods; but with them the Elysian Fields of the lower world held, morally speaking, the same place in relation to the great doctrine of the divine retribution for the good and evil actions of human life. The Elysian of the classic mythology is in all essential respects the natural equivalent of the heaven of the just. The Pythagorean doctrine of metempsychosis approached nearer to it in form, for it supposed that the soul, after the purification of successive transmigrations, was elevated to a higher and incorporeal condition in the cosmos. The doctrine of Plato was still more explicit. Although scepticism was rather the rule than the exception, it may be said in general that all the philosophical systems which included the belief of the immortality of the soul, also involved, at least in substance, the idea of a state of happiness as the reward of a virtuous life. The conception of the heaven of these various creeds differed widely from the spiritual delights of the heaven of revelation, each nation and each class forming to its own ideal of enjoyment. The delights of the classic Elysium were, at all events in part, delights of sense. The German warrior had his war-horse and his armour laid in his grave, that he might be able to pursue, after death, the fierce enjoyments in which he had done his work while in the world of the living. The paradise of the Indian hunter is but a richer and more extensive hunting-ground. Still, not only these, but even the more grovelling conceptions of the paradise of other races, must be regarded as a natural manifestation of the same instinct, or as a remnant, however overlaid by error and superstition, of the same primate revelation upon which the scriptural notion of heaven is founded. Accommodating itself to the popular conceptions of the Jews, the biblical phraseology frequently implies the idea of the solid firmament already described; but the word, according to the common acceptance among Christians, is generally used Synopsis, Catholic to indicate the abode of the blessed spirits, the special seat of His glory, in which the angels minister to Him, and the blessed spirits abide in perpetual praise and adoration. This abode of perfect bliss is believed to have been opened to the just after the passion of our Lord and his ascension into heaven. Out of the just of the old dispensation, only Enoch and Elias were directly admitted to heaven; the patriarchs, the prophets, and in general the just, before the new dispensation, were detained in a preparatory abode, which the Fathers call by the name Limbus Paterum, awaiting the coming of the common Redeemer. The common belief of Christians has been, that, since the coming of Christ, the just who are free from sin are admitted into heaven immediately after death. More than one controversy, however, has arisen on the subject; the most important of which are the Millenarian controversy (see MILLENNARIANS), the Origenistic controversy (see ORIGEN), and that on the question whether the just are admitted to the beatific vision of God immediately after death, or only after the general resurrection. The latter controversy is out of the nature of the happiness of heaven; a discussion which would be out of place here. The Koran adopts the Cabballistic notion of seven heavens, which arise each above the other like the stages of a building; and it places the happiness of heaven in the enjoyment of sense. The Cabballistic writings divide these seven heavens according to the successive degrees of glory which they imply. The seventh is the abode of God and of the highest class of angels; the sixth, fifth, fourth, and third, are the successive abodes of the various grades of angels, arranged according to the degrees of dignity. The second is the region of the clouds, and the first the space between the clouds and the earth. Of the apocryphal books of the fifth c., the Testament of the Twelve Patriarchs, contains a very curious exposition of the same notion. See Fabricius, Cod. Pseud. Vet. Test. i. p. 545.

HEBEB, FRIEDRICH, a modern lyric and dramatic poet of Germany, was born at Wesselsburen, in Ditmars, duchy of Holstein, Germany, 18th March 1813; studied at Heidelberg and Munich; and after travelling in France and Italy, settled at Vienna, where he married the actress Christina Enguins in 1846. His principal works are his Oedipus in 1842, Hamb. 1842; Leip. 1848, remarkable both for their melody and beauty, and several dramas. H. has a rich imagination, great power of thought, an energetic and original style, but too great a predilection for the horrible and the exaggerated—Compare Henckel, Das Deutsche Drama der Gegenwart (Greifsw. 1853).

HEBE, the goddess of youth, the daughter of Zeus and Hera—according to others, of Here alone—was the wife of Hercules after he had been defeated. She was the cupbearer in Olympus, before Zeus established her upon Ganymedes, his son, but she always retained the power of restoring the aged to the bloom of youth and beauty. According to Apollodorus, she became the mother of two sons by Hercules—Alexaires and Aniketes. In Homer, she always appears as a virgin. In Athens, altars were erected to her conjointly with Hercules. In Rome, she was worshipped under the name of Juventas, and a temple in her honour existed on the Capitol Hill at the time of Servius Tullius. Statues of H. and Hercules were to be recognised only by the drinking-cup.

HEIDER, REGINALD, an English poet, and second Bishop of Calcutta, was born at Malpas, Cheshire, 21st April 1783. In 1800, he entered at Brasenose College, Oxford, and was elected to a scholarship at the Bodleian; and after producing a poem on Palestine, the only poem he ever published, which holds a place in English literature. In 1804, he became a Fellow of All Souls. In 1807, he was inducted into the family-living at Hodnet, and entered upon his parochial duties with great zeal. He was a frequent contributor to the Quarterly Review, his political views being those of a Tory and High Churchman. In the course of 1812, he published a volume of HYMNS. He was appointed Bishop of Raphelston in 1813, and two years after he received a stall in St Asaph Cathedral. He edited the works of Jeremy Taylor in 1819, and in 1822 he was elected preacher of Lincoln's Inn. Shortly afterwards, the vacant see of Calcutta offered to him, and after much hesitation on account of his wife and child, it was accepted, and he embarked for India on the 16th June 1823. On his arrival, he entered upon his duties with exemplary zeal; and in June 1824, he was induced to leave India. He spent about eleven months visiting stations in Upper Bengal and the north of Bombay. From April to August 1825, he remained at Bombay, and sailed from thence to Calcutta, where he arrived on the 30th October. He proceeded on a visit to Madras on a visit to the southern provinces. He
reached Trichinopoly on the 1st April, and on the 3d, after conforming fifteen natives, and bestowing on them the episcopal benediction, he entered a cold bath, in which, half an hour afterwards, he was found dead. The Journal which he kept during his tour of visitation was originally published in three octavo volumes, and was afterwards reprinted in two volumes in Murray’s Home and Colonial Library. His life was published by his widow in two volumes (Lond. 1830).

As a poet, his fame rests upon Palestine and his Hymns, the latest edition of which was published in 1853. They have not much force or depth, but they are pleasingly versified, and are illuminated by graceful fancy. As a poet, he will be remembered; but as the most learned and zealous of Indian bishops, he is mainly enshrined in the affections of his countrymen.—RICHARD HEBER, half-brother of the preceding, was born in Westminster in 1773, and died in 1833. He was a famous bibliomaniac. Having succeeded to large estates by the death of his father in 1804, he was enabled to indulge his elegant hobby to the utmost. Dr Dibdin estimated his collection in England at 105,000 vols., in addition to which he had borrowed armories from the continent, the whole having cost him £180,000.

HEBERT, JACQUES RENÉ, commonly known as Père Duchesne, one of the most prodigal characters of the French Revolution, was born at Aix-en, in the year 1738. At an early age, he went to Paris, and became a servant in one of the small theatres, but was dismissed for embezzling money. He then entered the service of a physician, but was soon dismissed for the same fault. At the commencement of the Revolution, a person of the name of Lemaire, under the title of Le Père Duchesne, published a small popular paper for the diffusion of constitutional principles among the people. The success of this paper induced the Jacobins to establish another of the same name, and H. was appointed editor; and knowing the tastes of the class of people he addressed, he displayed such an exaggeration of principles and cynicism of language as ruined the enterprise of his honest rival. In consequence of the events of this period, he became a member of the revolutionary council, and played a conspicuous part in the horrors of September. He and his associates, called Hébertists or Enragés, were likewise mainly instrumental in causing the famous “March of Notre Dame de Rezon.” He was at length obliged to give way before the party of Robespierre, and perished on the scaffold on the 24th March 1794.

HEBREWS [Heb. Ibrî—either from Abraham, who came ‘from the other side’ of Euphrates (Iber, Her, or from Eber, the great-grandson of Shem, and one of Abraham’s ancestors) is the distinctive name of that branch of the Semitic family which migrated from Mesopotamia into Palestine, thence went to Egypt, and, after a long period of bondage, reconquered Palestine, and finally settled there. Divided, at a later period, into two distinct states, that of Judah and of Israel, they were singly overcome, and led into exile. A portion, chiefly consisting of descendants of Judah (Jehudiah), returned, and founded a new empire. From that time forward, all the members of the Mosaic commonwealth were known by the name of Jehudim, corrupted into Jews. A continuous sketch of their entire history from the days of Abraham to our own, as well as a brief outline of their language and literature, will be found under JEWS.

HEBREWS, EPISTLE TO, one of the Epistles of the New Testament. Much discussion has arisen with as to its canonicity and authorship, the absence of the customary superscription rendering it impossible to attain certainty in regard to the latter, and naturally enough tending to throw doubt on the former also. In reference to the first and most important of these points, the canonicity, the case stands as follows: The earliest post-apostolic writers, Clemens Romanus, quotes from it in the same way as from the other books admittedly canonical. Justin Martyr, Pinytus (?), the Cretan bishop, the predecessors of Clemens Alexandrinus and Origen, and the framers of the Peutinger Table, view the New Testament, accept it as authoritative; while the Gnostic heretics, Basilides and Marcion, are spoken of as distinctly rejecting it. No disbelief of its canonicity is expressed by any of the churches until after the middle of the 2d c.—though many writers are silent altogether about it—after which period, for the next two centuries, the Roman and North African churches reject its authority. Tertullian speaks of it as a good sort of apocryphal book; Cyprian does not include it in Paul’s epistles; Irenæus, even while defending the divinity of Christ, declines to strengthen his argument, which he could very effectively have done, by the omission of this Epistle; and, in a passage referred to by Jerome, who, though frequently too hasty in his conclusions, was certainly the most learned and accomplished of the Latin Fathers. The immense authority of Augustine is thrown into the same scale; others are for and against, and in 416 A.D. a decretal of Pope Innocent III. placed its canonicity beyond cavil. In modern times, Cardinal Cajetan, the opponent of Luther, reopened the ancient controversy. He rejected the authority of the epistle. The great reformer did the same, affirming that it was the work of some disciple of Paul’s, who had not been thoroughly grounded in his master’s teaching, and had built his own ‘wood, hay, and stubble’ upon the apostle’s gold, silver, and precious stones. This opinion, however, met with small approval, and has never been adopted by any Protestant church.—Authorship. As we have already said, the author of the epistle is unknown, and it is supposed to be St Paul. This appears to have been the opinion of the Eastern church from the first; but the Alexandrian Fathers—the most critical and scholarly of the early Christian theologians—struck with the entire dissimilarity of style, phrasing, and mode of thought which it presents to the Pauline epistles, and which is abundantly manifest even in the English version, sought to fix its authorship on some other person, Luke being the favourite. Tertullian, again, states that, according to the traditional belief of the North African school, Barnabas was the author. The Roman Church, down to the middle of the 4th c., contented itself with a negative position, denying its Pauline authorship. The opinion of the Alexandrian school may be said to have prevailed, viz., that though Pauline in essence, the epistle was not Pauline in form. Thus the matter remained till the time of Luther, who suggested Apollo as the likeliest author. Since then, many scholars have inclined to the same opinion, among others, Le Clerc, Bleek, De Wette, Tholuck, Bunsen, and Allford. Who were the ‘Hebrews’ to whom the epistle was sent, is far a matter of doubt; but the preponderance of probability is very strongly on the side of the church at Jerusalem, composed of those who were ‘Hebrews of the Hebrews.’ The date of the epistle can only be inferred from its 253
HEBREWS—HEBRIDES.

Heb. It must have been before the destruction of the temple, for the author of the Hebrides, a name applied to the islands, before the temple, being not alluded to, which would have been one of the strongest links in the chain of argument to prove the temporary nature of the old national faith.

The purpose of the writer of the epistle is apparently to encourage the Jewish Christians of Jerusalem—perhaps of all Palestine—to persevere in the profession of their faith. In their own 'Holy Land,' and in the perpetual presence of services that time and hallowed, and which were associated with all that was glorious and dear in their national history, they were apt at times to look back with a melancholy yearning on the past, and thus were oftener induced to apostatise from motives which they hardly dared to condemn. The writer, conscious, it would seem, of the existence of this feeling, opens up with bold unflinching eloquence the whole question of Judaism versus Christianity; exhibits the contrast between every islet with sharp, incisive analysis, strips the former of all its accidental and superstitious attractions, and shews that what is really deep and valuable in it is its prophetic character; it is but the shadow of a 'better hope,' viz., 'the New and Eternal Gospel.'

To this end the writer has associated the visions of Judaism, from Abel downward, illustrating the truth of this, for 'these all died in faith, not having received the promises, but having seen them afar off.' But so vital and strong was their faith, that it may almost be said to have put them in a spiritual possession of the realities to which they looked forward, for 'faith is the substance of things hoped for, the evidence of things not seen.' Thus they were 'Christians before Christianity,' and now that the things which they hoped for had come, the Jewish believers ought not to be grieved at parting with the old national worship, however dear, for the new worship really embraced the substance of the old, and thus bestowed upon it its own immortality. Such is, in the main, the course of thought. The style of the epistle in several passages is richly rhetorical.

HEBRIDES, the name applied in a general sense to all the islands on the west coast of Scotland. They have been variously classified; but the most usual division seems to be into the Outer and Inner Hebrides. To the Outer belong Lewis, with Harris, North Uist, Benbecula, South Uist, Barra, Coll, and Tiree. The remote isle of St Kilda might be added to this external division. The principal isles of the Inner islands are Skye, Eigg, Mull, Iona, Staffa, Ulva, Lismore, Kerrera, Easdale, Colonsay, Jura, and Islay. Bute, the Cumbraes, and Arran, though lying in the Firth of Clyde, are usually classed with the Hebrides. The whole are popularly spoken of as the Western Isles, the term being confined chiefly to literature.

The total number of the H. is about 490 (which number is rather more than 120 are inhabited. The entire area is not accurately known, but has been estimated at upwards of 3500 square miles, and the population (according to the census of 1801) close upon 100,000. Of the whole surface, only about 200,000 acres are arable, the rest is pasture-land of little value, and in morasses, peat-mosses, lakes, and overflowing sands and rocks. The scenery of Skye is grand and picturesque: Mull is noted for its lofty mountains, Jura for its peaks, and Arran for its high rugged hills. Islay and Bute are comparatively level and arable. Staffa is remarkable for its basaltic columns, and great caverns. Iona derives interest from its ruins and historical associations. Politically, all the Hebridean

Isles are attached to Scotland, in the civil and ecclesiastical government, though they are distant from the mainland.
transferred to Scotland. In 1346, one of the chiefs, named Macdonald, reduced the whole under his authority, and took the title of 'Lord of the Isles'; but in 1349 he was vanquished by the Scottish crown by James V. The H. were ecclesiastically dependent on Norway as late as 1374, and Professor Munch argues that this relation lasted till 1472, when St. Andrews was made the seat of a metropolitan. The influx of the Norsemen has had here, as elsewhere, great influence over the nomenclature; many places and islands having lost their original Celtic designations.

The H. have, from time to time, been visited by learned inquirers, among whom may be named Martin, Sir Joseph Banks, Pennant, Dr Samuel Johnson, and Dr John Macculloch, who wrote a geographical account of the islands (2 vols. 8vo, with a volume of plates, 4to, 1819). Scott's Lord of the Isles contributed materially to attach a popular interest to these islands, which, by the aid of Hutcheson's steam-boat, are now within the compass of summer pleasure travelling. The more important islands of the H. are described in separate articles.

For the early history of the H., consult Chronica Regum Manniae et Insularum, edited from the MS. in the British Museum, by F. A. Munch, professor of history in the university of Christiania (Christiania, 1844).

HEBRIDES—HECATOMB.

HEBRIDES, New. See New Hebrides.

HE'BRON, one of the oldest cities in Palestine, belonging to the tribe of Judah, 21 miles south-southwest of Jerusalem; it may even be regarded as one of the oldest in the world, for it was in existence in the time of Abraham, nearly 3000 years before Christ. H. was in 1540 they were finally annexed to the Empire, the hereditary seat of the Empress Helena, the mother of Constantine, on the spot where Abraham is said to have been buried, has been converted into a mosque called El-Haram, the alleged tombs of the patriarch and of several meritorious Pelops and Leneas, the former richly hung with palms of green or red silk, which are renewed from time to time; but it is believed that the real tombs are in a 'cave' below the building. The modern name of the town is El-Khaliil ('the friend,' i.e., of God), in allusion to Abraham. About a mile from H., rising solicitarily in the midst of vineyards, beside a well of pure water, is one of the largest oak-trees in Palestine. It is 23 feet in girth, and its foliage covers a space of about 90 feet in diameter. Some say that this is the very tree beneath which Abraham pitched his tent; but this notion is untenable, for the tree itself gives no evidence of such enormous antiquity; and besides, Jerusalem speaks of Abraham, having disappeared about the time of Constantine.

HECAT'ETUS, the son of Hegesander, famed as an historian and a geographer, flourished most probably about 500 B.C. There is great difference of opinion as to the time of his birth and of his death, but the best critics conclude that he was born about 550 B.C., and that he died about 476 B.C. He belonged to an ancient and wealthy family of Miletus, and was thus enabled to gratify his natural passion for knowledge and travel. He seems to have been a good sailor, the country bordering on the Euxine, and many of the provinces of the Persian empire, with parts of Italy, Spain, and Africa. The results of his foreign travels and of his private studies were embodied in two great works—his Tartar of the World, and his Genealogies. His geographical work was divided into two great portions, one treating of Europe, the other of Asia, Egypt, and Libya. He improved the map of the world which had been made by Anaximander. His Historiae was little more than a prose version of the poetical legends of the Greeks—about Deucalion and his descendants—Heracles and the Heraclices—the Peloponnesian traditions—and those of Asia and Africa. He claims to have set considerable value on the writings of Hecateus. The fragments of the works of H. have been edited by Creuzer, Klason, and others.

But the most interesting part of the life of H. is that which succeeded his travels. In the revolt of the Ionians against Persia, his extensive knowledge of the Persian empire and its resources enabled him to give sound advice to Aristagoras, the ringleader of the insurrection, which, however, was rejected. He dissuaded his countrymen from an attempt so far above their means; when that counsel was despised, he urged the formation of a fleet, but without effect. After defeat had humbled the Ionians, and Aristagoras, with others, contemplated flight to Sardis, he warned them (though in vain) to fortify the island of Leros, and wait there the course of events. He afterwards went as ambassador to the Persian satrap Artaphernes, and induced him to treat the Ionians with leniency.

HECAT'E, an ancient Thracian goddess, afterwards adopted into the Greek Pantheon, is first mentioned by Hesiod, who calls her the daughter of the Titan Perse, and of Asteria, or Night. She was the only one of the Titans, under the rule of Zeus, who retained her former power. She appears on some occasions as the bestower of wealth, victory, wisdom, good-luck to sailors and hunters, and prosperity to youth, but able also to withhold these blessings. In connection with Persephone, she is described as a powerful infernal and cruel deity, who has all the magic powers of heaven, earth, and sea at her command. Particular honours were paid to her in Boeotia, at Erechthe, and even in the Eleusinian mysteries. She played an important part in the mysteries of the Calabri, which were celebrated principally at Samothrace, and her sanctuary in Samothrace was the Zerynthian Cave, and wherever she was worshipped along with the Calbri, her temple was placed near a cave. As the bestower of good and averter of evil, her image was placed before the houses of persons of rank, in places of popular assembly, and at cross-roads, where at every new moon offerings of food were presented to her, which were consumed by poor people. As an infernal goddess, she appears in a hideous form. Serpents issue from her feet, serpents are twined in her hair, she bears a lighted torch and a sword in her hand, and two black shaggy dogs are her attendants; and sometimes she is represented with three heads, viz., those of a horse, a lion, and a dog. In her last form, she appears at the cross-roads. There is another important feature, which arise from the notion of her being an infernal divinity, viz., the serpent in her being a living being, who at night sent from the lowest world all kinds of demons and terrible phantoms, who tortured sorcery and witchcraft, and dwelt at cross-roads, tombs, and near places where murder had been committed.

HE'CATOMB (Gr. hecaton and bous), in the worship of the Greeks, and in other ancient religions, means a sacrifice of a large number of oxen, generally, although by no means necessarily, one hundred.
HECKER—HECTOR.

Originally, it would seem that the practice was to burn the entire victim; but even as early as the time of Homer, it was usual only to burn the legs wrapped up in the fat and certain parts of the intestines. The head was sometimes cut off at the festive meal which succeeded the sacrifice. Besides, therefore, that the gods were believed to be propitiated in proportion to the number of victims, the increase of the number was also gratifying, not alone to the priests and servants of the temple, but also to the public, who were admitted to the sacrificial banquet. Hence in Athens the hecatomb was a most popular form of sacrifice (Athenaeus, i. p. 3). On the contrary, the thrifty Spartans limited the number both of the victims and of the sacrifices; and while the other Greek states required that the victim should be of the most perfect kind, the Spartans were content with animals of a very inferior character. In the hecatomb, strictly so called, the sacrifice was supposed to consist of one hundred bulls; but other animals were frequently substituted.

HECKER, FRIEDRICH KARL FRANZ, a leader of the democratic party in the German revolution of 1848, was born at Eichersheim, Baden, September 28, 1811, and after studying law in Heidelberg, became a member of the Baden chamber of deputies in 1838 that year. He fled to France, after the revolution of 1833, and in 1842 was elected a member of the second chamber in Baden, by which he obtained the post of a member of the executive council at Heidelberg. Though rising to eminence as a pleader, when elected in 1842 a member of the second chamber in Baden, he abandoned his profession for political life, and soon grew popular among the more advanced sections of the population. In 1846 he began to side actively with the purely democratic and socialistic party outside of the chamber, and on the revolution breaking out in 1848, immediately began to employ his eloquence in revolutionizing policy. When the preliminary convention (Das Vorparlament) met, he endeavoured, with the influence of his whole party, to constitute it into a permanent republican assembly. The frustration of this effort led him to think of surprising the smaller governments of Southern Germany with the artisan bands which had been sent to the Rhine. Defeated at Kander, April 20, 1849, he fled into the canton of Basel, where he conducted a newspaper against the constitutional party. On being refused admission into the parliament, though elected to represent Thiengen, in Baden, he emigrated to America, where he had bought a farm near Belleville, Illinois. The Baden revolution, in May 1849, enticed him back to Germany, but finding his letter of introduction over when he arrived, he returned to America.

HECKLES, or HACKLES, and GILLS. These are very important parts of various machines, employed in the preparation of animal and vegetable fibres for spinning. They consist of a series of long metallic teeth, through which the material is drawn, so that the fibres may be combed out straight, and so fitted for the subsequent operations. The manufacture of heckles and gills involves great care and nicety, as any imperfection may cause great loss, by damaging the fibre which passes through them. For flax, hemp, jute, and similar large and coarse fibres, the teeth of the heckles are large, being about eight inches long, and made of steel wire one-fourth of an inch in diameter. This is gradually reduced from the base upwards, until it ends in a fine point. The whole is beautifully polished, so as to prevent injurious friction. They are fixed in a wooden or metallic base, in several rows, alternating with each other at short intervals, in heckles; in gills the teeth are much finer, resembling needles, and few in number, being placed usually in two rows; they constitute a part of the spinning machinery. The manufacture of these articles is a special trade; the manufacturers are called Heck-makers.

286

HECKMUNDWIEKE, a thriving manufacturing village of England, in the West Riding of Yorkshire, is situated on the Lancashire and Yorkshire Railway, three miles north-west of Dewsbury, and ten miles south-east of Leeds. It is the chief seat of the carpet and blanket trades in the West Riding. Pop. (1861) 6339.

HECUA, or HEKLA, a volcanic mountain in Iceland, is of a conical shape, and stands isolated about 20 miles from the south-west coast. Its snow-capped summit is 5110 feet high, and the crater, when visited by Sir George Mackenzie, was about 100 feet deep, and contained a large quantity of snow in the bottom. There are many small secondary craters near the summit. The sides of this mountain are extremely precipitous, and the aspects of all the formations that are visible are of a volcanic origin. It is considered one of the most interesting mountainous regions of the world. The general appearance of the crater is very striking. Fantastic groups of hills, craters, and lava, leading the eye to distant snow-covered jokuls; the mist rising from a waterfall; lakes embosomed amid bare bleak mountains; an awful and sublime scene; and the advancing clouds mark all around of the formation of the most destructive of the elements, give to the region a character of desolation scarcely to be paralleled.

A record of the eruptions has been kept since the tenth century. They are few in number, only 45, but they have been always very violent, and generally continuing for a considerable time. One of the most tremendous occurred in 1783, when the immense quantity of lava and ashes ejected laid waste a large extent of country. The internal fire remained, as if extinguished, in a quiescent state till September 1845, when with terrific energy it again burst forth, and continued active for more than a year. At this time, it poured out a torrent of lava, which, at the distance of two miles from the crater was one mile wide, and from 40 to 50 feet deep. A fine dust from this eruption was scattered over the Orkney Islands, a distance of 400 miles from Hecla.

HECTARE. See Are.

HECTIC FEVER. (Gr. hektikos, habitual), (see FEVER), a peculiar type of feverish disease, usually found associated with organic disease of the chest or abdomen, and above all with tubercular disease, or consumption. It can scarcely be considered an independent form of disease, although carefully described as such by most of the older authors, and distinguished as a fever with morning and evening paroxysms, and intermediate remissions. Generally speaking, the evening paroxysm is the more marked, the patient becomes flushed after eating, or in the excitement of conversation; there is a preternatural vividness of expression, which, with the heightened colour, sometimes gives a very fadacious impression of breath from the mouth retires to bed before the usual time, and uneasy sleep, and wakenings in the middle of the night, or towards early morning, bathed in cold perspiration, and in a state of extreme languor. Next day the whole of these changes are repeated, and under the slow but too sure progress of the fever, the patient gradually emaciates, and in the end dies exhausted. The treatment of hectic fever is substantially that of Consumption (q. v.).

HECTOR, the bravest hero in the Trojan army, was the son of King Priam and Helebe, and married Andromache, the daughter of Eetion, king of Thesprotia, in Cilicia, by whom he became the father of Astyanax or Scamandrius, and, as some say, likewise of Laodamas. His exploits are sung by Homer in the Iliad. H. having slain Patroclus, the friend of Achilles, the
latter, forgetting his quarrel with Agamemnon, took up arms to avenge his beloved companion, and H. fell by his hand. His body was dragged in triumph by the conqueror round the walls of Troy, but was afterwards ransomed by Priam, who caused it to be buried with great pomp. In Ilium, H. was honoured as a hero, and sacrifices were offered to him. In compliance with an oracle, his bones are said to have been preserved and catered for, in Bithia. H. is incontestably the greatest hero in the Iliad. Yielding in valour to none, he is defeated by Achilles, not because the latter surpasses him in courage, but because, already wounded and exhausted with protracted conflicts, he undertakes a single combat, trusting to the aid of Diaphthus. Minerva assumes the form of the latter, and H. is deceived and forsaken. In humanity, he is superior to all. One of the most beautiful episodes in the Iliad is that in which H. takes leave of his wife Andromache, and expresses his feelings as a husband, a father, and a prince.

HECUBA (Gr. Hekōbe), the second wife of Priam, king of Troy. During the Trojan war, she witnessed the destruction of all her sons, with the exception of H., who last saw her husband alive before his eyes by the savage Pyrrhus. After the destruction of Troy, she fell into the hands of the Greeks as a slave, and, according to one form of the legend, threw herself in despair into the sea. Euripides (in his tragedy of Hecube) and other ancient tragedians describe her as a tender mother, a noble princess, and a virtuous wife, exposed by fate to the most cruel sufferings. In Sculpture, she is represented as a matron, whose face, forrowed by grief, betrays a character naturally ardent and passionate.

HEDGE (Sax. hege, Ger. hag, Fr. haie; in Ger., hagen is to fence, protect, cherish), a fence formed generally of growing shrubs. Hedges are very much used in some parts of the world, whilst others, equally cultivated, are almost destitute of them. Thus, whilst they are very common in many parts of Britain and of Italy, they are comparatively rare in France and Germany. For many situations, they are particularly adapted, owing to their protection which they afford from high winds; and the height to which they are permitted to grow ought to be accommodated to the requirements of the locality in this respect. They are also much more pleasant to the eye than dry stone walls or capping; but there can be no doubt that wherever shelter or ornament is intended, they cause great waste of land; as even when very trimly kept, they occupy a much more considerable breadth than other fences, and their roots draw nutriment from the soil on each side to a very considerable distance. It has been calculated that even such reduction of the breadth occupied by hedges as might be accomplished by moderate care in trimming, would add to the extent of land available for crops in England as much as a middling-sized county. Hedges in Britain are generally formed of hawthorn (q. v.). The unsightly blanks in hawthorn-hedges, which are also injurious to their usefulness, are not easily filled up with hawthorn-plants, but in such circumstances, the barberry grows well, and is sometimes used with great advantage. Hedges are also sometimes formed of barberry itself. See FRUIT.

Hedges in Britain are very common around gardens and pleasure-grounds, and a hedge of beech and hawthorn mixed is common in many places. Beech-hedges, closely trimmed, can be made almost as expressive of any kind of hedge, as any kind of hedge in Britain; and where shelter is needed, can easily be trained to a height of twenty feet or upwards.

HOLLY makes an excellent and ornamental hedge much in use for gardens and pleasure-grounds. Ornamental hedges are sometimes formed of yew, hornbeam, lime, and other trees, which can scarcely, however, be reckoned among hedge-plants. Privet is much used for ornamental hedges, but they are of little use as fences.

Hedges were in use among the ancient Romans, chiefly for the enclosure of vineyards and gardens. It is probable that they have existed in England since the times of the Romans, although not very common till the end of the 17th c.; but they are supposed to have been first introduced into Scotland and Ireland by the officers of Cromwell's armies. The first hedges planted in Scotland are said to have been at Inch Buckling Brae, in East Lothian, and at the head of Loch Tay, and that at the former place existed as a row of old hawthorns in the beginning of the present century. (Loudon.)

HEDGE-BOTHE, in English Law, means the right of a tenant to cut wood on the farm or land, to repair the hedges or fences.

HEDGE-HOG (Erinaceus), a genus of insectivorous quadrupeds, the type of the family Erinaceidæ. The muzzle is rather elongated, the neck short, the limbs short, the feet five-toed, the orcers strong, the tail short, the body covered on the upper parts with sharp spines, and with hair below, and capable of being rolled up into a ball by means of a powerful muscle extended under the skin. The teeth are 30 in number, 20 in the upper jaw and 16 in the lower, but considerable difference of opinion has existed among naturalists as to the character of some of them. The middle incisors are very long, and stand forward; those of the upper jaw are widely separated; the lateral ones small. Like many other Insectivora, hedgehogs are by no means limited to insect food, but prey on larger animals, as reptiles, small quadrupeds, and birds; they are fond of eggs and of milk, and in confinement will readily eat soaked bread, cooked vegetables, or porridge. Their power of rolling themselves into a ball, from which the spines project on every side, is their means of protection from enemies. The spines are curiously bent near the root, and so set, that on the contraction of the muscle by which the animal rolls itself up, they are held firmly in their position, their points towards the adversary. They are very strong and sharp; their elasticity is also so very great, that the animal can sustain falls from great heights without apparent injury.

The Common H. (E. Europæus) is a native of Britain and of most parts of Europe. A particular description is unnecessary. Its short ears are one of its distinctive species. It is seldom above 9 inches in length. Its spines are about an inch long. It readily kills snakes, and even
vipers, which it eats, beginning always at the tail. It is said to be capable of resisting in an extraordinary degree not only the venom of serpents, but other kinds of poison, however administered. A H. has been known to eat great numbers of cantharides (Spanish flies) without injury, although one would have caused great agony to a dog. It brings forth from two to four young at a birth, and provides for the occasion a curiously constructed nest, of which the roof is capable of throwing off the rain, so as to keep them dry. The young are blind at first; their ears are also closed—a thing as unusual as the former is common among animals—their bodies are covered with soft incipient spines.

In winter, the H. becomes torpid, retiring to some hole at the base of a tree, beneath roots, or in some such situation. It provides no winter store, and no other British animal hybernates so completely.

The H. is easily tamed, becomes very familiar, and is very useful in houses where black beetles are troublesome. Night is its period of activity. The flesh of the H. is eaten in some parts of Europe, but in Britain only by gypsies, who roll it up in a ball of clay, and so roast it. Other species of H. are found in different parts of Asia and Africa.

**HEDGE-MUSTARD (Sisymbrium),** a genus of plants of the natural order Crucifera, mostly annual or perennial herbaceous plants, with various flowers, either yellow or white, and a long roundish or 6-angled pod (allique). Several species are natives of Britain, of which one, the **COMMON H.** (S. officinale), was once employed in medicine for catarrhs and other ailments. It is said to be diaphoretic and expectorant. It has a mild pungency. It is sometimes cultivated as a pot-herb. It is an annual plant, plentiful in waste places and by waysides, sometimes two feet high, branched, with runcinate or deeply lobed leaves, stem and leaves hairs, flowers very small and yellow. The pods are erect, and closely pressed to the stalk.—**BROAD-LEAVED H.** or **LONDON ROCKETS** (S. trio), is said to have sprung up in great abundance on the ground desolated by the fire of London in 1666. —**FINE-LEAVED H.** or **FIX-WEDD** (S. Sophia), is common in many parts of England and Scotland, growing in waste places. Its leaves are doubly or trebly pinnatifid. It is about two feet high, branched, with yellow flowers. It was formerly administered in dysentery and hysteria, and the seeds as a vermifuge.

**HEDGE-SPARROW, HEDGE-WARRBLER, HEDGE-ACCENTOR, or DUNNOCK (Accentor modularis)**, a little bird of the family Sylviidae, a common native of Britain and of most parts of Europe. It is not quite so large as the house-sparrow, which it somewhat resembles in dull brownish plumage, but notwithstanding its most common name, in little else; its slenderness of bill, and its whole form, proclaiming it at once to be of a different family. It feeds principally on insects. It is one of the earliest spring songsters, having a sweet plaintive song; and the nest is one of the first that the school-boy finds in spring. The nest, of green moss, roots, and wool, lined with hair, is usually placed rather low in a bush or hedge. The eggs are five or six in number, of a delicate and speckles bluish green.

The yarrow very often lays its egg in the hedge-sparrow's nest. The hedge-sparrow is chiefly found in summer, in the northern temperate parts of Europe, migrating southward in winter; but in Britain it remains all the year. Another species of the same genus, the **ALPINE WARRBLER**, or **ALPINE ACCENTOR** (A. Alpinus), a rather larger bird, lighter and rather more varied in colour, has in a few instances been found in Britain. It is common in the Alps, and other mountains of France, Germany, and Italy. Other species of Accentor are found both in the Old and New World. They are all of dull plumage. In this genus the bill is more conical than in the other Sylviidae.

**HEDJRAZ** (the land of pilgrimage), a maritime province in Africa, extending along the eastern shore of the Red Sea, and bounded on the N. by the Syrian desert and the Gulf of Akaba, on the E. by the province of Nodjed, and on the S. by that of Yemen. It is almost entirely desolate, being chiefly sandy or stony. Containing the two sacred cities, Mecca and Medina—the former the birthplace of Mohammed, the latter the place in which he is interred—H. is the 'Holy Land' of Arabia. It is traversed annually by vast numbers of caravans.

**HEDJRAH (Hegirah), or, more fully, HEDJRA AL-NABI, Arab. Emigration (not flight, as commonly translated) of Mohammed (q. v.). The tribe of the Koreish having resolved to slay the new prophet, his kinsmen, he secretly left Mecca on the 18th of September 622 A.D., and repaired to Medina, where, partly because his new doctrine had already found here many new adherents, he was so well received, and vigorously supported in the war which he now began to wage against his adversaries, that the rise and progress of Mohammedanism was said to date in reality from the time of Mohammed's leaving Mecca. The Hedjrah, therefore, was the starting-point of a new Mohammedan Medinah (Tarikh Alhijrah)—by Calîf Omar, who, in 639 or 640, with the aid of a Persian, Harmanz, instituted the new Medinah calendar. It does not, however, as is generally supposed, begin from the day of the flight itself, but from the first of the Moharram (the first month of the year) preceding it—a date corresponding to our 15th or 16th of July 622 A.D.

The Mohammedan year, as a lunar year, is shorter than ours by 10 days, 21 hours, and 141 seconds; and this circumstance renders the exact transfer of Mohammedan dates into dates of our own calendar a very difficult task. An elaborate method has been invented for that purpose by Idelbi, an émi,

**HEEM, JAN DAVID DE, the most celebrated painter of what is called 'still-life' that the Dutch school has produced, was born at Utrecht in 1600, studied under his father, and soon obtained**
HEHEN, CHOW, TING, AND FOO—HEGEL.

immense sums for his pictures. Towards the close of his life, he removed to Antwerp, where he died on the 17th of October, 1798, of a disease which was probably the cause of his death. He left to the world, more or less, splendid vases of flowers and fruits, musical instruments, and ornaments of various kinds. He painted a garland of flowers for a certain Jan Vander Meer, who refused 2000 guilders for it, but afterwards gave it to the Prince of Orange, who brought it with him to England. H.‘s colouring is exquisite, and his use of chiaroscuro unsurpassable.

HEHEN, CHOW, TING, AND FOO, Chinese geographical terms, used to designate the relative rank of cities and districts. Heen indicates the smallest division, although its city may be an important one; thus, Shanghai-hen is a large city and district, while the department in which it is situated, Sangkia, foo, to which it is subordinate, is a smaller place.

Generally speaking, however, the terms designate the rank of cities, from foo, the chief, to heen, the least in size.

HEEREN, ARNOLD HERMANN LUDWIG, an eminent German scholar, was born 25th October 1760, at Amsterdam, near Bremen, where his father was at that time pastor, and received his education at the cathedral school of Bremen, and at the university of Göttingen. He first made himself known to the literary world by two philological works—viz., an edition of Menander’s De Encomium (Göttingen, 1785), and the Ethique Physique et Éthique de Stobaeus (4 vols. Göttingen, 1792—1801). In preparing materials for the latter of these works, he visited Italy, the Swiss states, and France, and by intercourse with various learned men of these countries, expanded and enriched his mind. In 1794, he was appointed Professor of Philosophy, and in 1801, Professor of History at Göttingen. He married in 1797 a daughter of Heyne, and died 7th March 1842. His lectures in the university referred, from the very first, more to Greek and Roman antiquities, and to the history of the fine arts, than to philosophy, strictly so-called. The latter, indeed, was finally quite thrown into the background. In 1793—1796, appeared at Göttingen his Ideen über Politik, den Verkehr und den Handel der vornehmen Völker der alten Welt (4th ed. 1824), in 5 vols. H.‘s work has secured him a place among the most eminent modern historians. If his Geschichte der Staatskunde der klassischen Literatur mit dem Wiederaufbau der Wissenschaften (2 vols. Göttingen, 1797—1802) proved less scalar to his scholars, his Geschichte der Staaten der Allerheiligen (Göttingen, 1799; 4th ed. 1826), and his Geschichte des Europ. Staatsystems und seiner Colonien (Göttingen, 1809; 4th ed. 1822) abounded in new views and acute expositions. For his Unternehmungen über die Kreuzzüge, he received the prize of the National Institute of France. His Kleine historische Schriften (3 vols. Göttingen, 1803—1808) contain some very interesting treatises. In 1821—1826, he published an edition of all his historical works (Historischen Werke) in 15 vols. H. was a member of the academies of St Petersburg, Berlin, Munich, Stockholm, Dublin, and Copenhagen, and of the Asiatic Societies of London and Calcutta.

HEGEL, GEORG WILHELM FRIEDRICH, one of the greatest German philosophers, was born 27th August 1770, at Arbredtwaad, near Kessel, in Prussia, and became, in 1788, a student in the Tübingen theological institute, where his speculative abilities, however, were outshone by his younger companion, Schelling. After leaving the university in 1793, he was a family tutor at Berne and Frankfurt-on-Main for six years, during which period he devoted himself chiefly to the study of Christ’s life and the philosophy of religion. In the beginning of 1801, he left Frankfort for Jena, where he published his first work, Über d. Differenz d. Fichte’schen u. Schelling’schen Systems (1801), and entered the university as Privatdocent. Next year, he joined Schelling, to whose philosophy he seems at this time to have adhered, though he never contributed to the editorship of Das Kritische Journal für Philosophie. His lectures were attended by very much notice, but it was at this place, while the din of the battle in 1806 was sounding through the town, that he completed his first important work, Die Phänomenologie d. Geistes (1807), which he used afterwards to call his voyage of discovery. Shortly before the battle, he had been made extraordinary professor of philosophy; but the disaster which that event brought upon Jena compelled him to seek means of subsistence elsewhere, and he went, accordingly, to Niæhammer’s request, to Bamberg, where he edited a political paper for two years. In 1808, he was appointed rector of the gymnasium at Nuremberg, and there he had just completed his Werke der Philosophie der Natur (1812—1816). While he was called in 1816 to a professorship of philosophy in Heidelberg, where he published his Encyclopedia d. philosophischen Wissenschaften (3 vols., 1821—1830), he first developed his complete system. In 1818, however, he was called to Fichte’s place in Berlin, and it was here that he first began to gather around him a new philosophical school. His lectures, which were delivered in a stately voice, and without any roccional ornament, yet with the impressiveness of being the expression of laborious thought, attracted hearers from all ranks and professions. He rose to considerable political influence through his official connection with the Prussian government, and he brought his philosophy in some respects lust credit from the generally conservative tendencies of his administration. Still, in his Rechtsphilosophie (1821), he demands representation for the people, freedom of the press, publicity of judicial proceedings, trial by jury, and the administrative independence of corporations. In the midst of an active life, he was suddenly cut off by cholera, 14th November 1831, and buried beside Fichte. A complete collection of his works was published in 18 vols. (Berlin, 1832—1841), and his life written by Rosenkranz (1844).

At first, as has been intimated, H.‘s philosophy started from the same point as Schelling’s—the principle of the identity of knowing and being; but at an early period he departed from Schelling’s theory, that this identity can be apprehended only through an intellectual intuition, of which the understanding can render no account. Carrying out rigorously the principle from which both started, as embodied in the proposition of Spinoza, that the order and connection of things are the same as the order and connection of thoughts, H. sought to find the universal form which characterises the process both of existence and thought. This universal form he recognised as the process of becoming (Werdun. But the process of becoming is only the union of position and negation; for all that becomes at once post, and, by passing into something else, removes itself. Identical with this process is the process of thought; for every thought involves its contradictory. But the contrary is not a mere negation; it is positive and negative; the conception of unity, e.g., is more positive than its contradictory, the conception of plurality. Every thought, therefore, as it involves its contradictory, adds to its own content, and by the combination of the two contradictories, we rise to absolute knowledge. This process, involving in it the three stages of position, negation, and the union of both, determines
HEGESIPPUS—HEIDELBERG.

the method of H. ; for according to this method, his entire system is organically necessitated in all its parts to a "threefold division corresponding to the three stages in the process of thought and existence. The point from which all knowledge must start is thought simply and in itself, the science of which, logic, forms, therefore, the first part of this system. But thought passes into something further than itself, exists outside of, and the philosophy of nature accordingly ranks as the second part. Returning again from its estrangement in nature, thought becomes conscious of itself in mind, and consequently the philosophy of mind forms the inquiry part. It would be profitless to give a mere enumeration — and nothing more could be attempted here— of the various subdivisions, in their degrees of subordination, into which these three greater, had reached its culmination before H. began to attract notice. In logic, also, owing to H.'s own exhaustive treatment, little has been done by his disciples, except in the way of explication and apology, of which Schaller's, Erdmann's, and Hesse's works on the science are specimens. But in psychology we find developments of the Hegelian principles by Rosenkranz, Miehle, and Erdmann; in jurisprudence, by Gans; in ethics, by Miehle; in aesthetics, by Vischer, F. H., Ernst, and Schmoller; in the history of philosophy, notwithstanding H.'s own work, by Erdmann, Miehle, Rosenkranz, Schwengler, Zeller, &c. In the philosophy of religion, however, Hegelian speculation has been more widely and powerfully influential than in any other department: Duhm, Marheinecke, Rosenkranz, Conradt, Göschel, Vatke, and a host of other more or less known writers, joining with H. in seeking to elicit the eternal meaning embodied in the historical and symbolical forms of Christianity. But as soon as Hegelianism reached this sphere of speculation, it began to shew antagonistic tendencies. These became especially apparent four years after H.'s death, in the contro- versy occasioned by Strauss' Leben Christi (1835), and continued by his Christliche Glaubenskreis (1840). The Hegelians then split into three sections, called severally the right, left, and centre, according as they represent supernaturalism, rationalism, or a mediating mysticism. Among those of the extreme left, known also as the Young Hegelians, and dubbed by Leo with the felicitous but untranslated diminutive Hephage, the Hegelian philosophy, which had before been ecclesiastically and politically conservative, became thoroughly radical. In 1838, Ruge began to edit for them a special organ, Die Hannerschen Jahrbücher, which was very influential among the youth of Germany, but was prohibited in 1837, after having been transacted to Leipsic under the title of Die Deutschen Jahrbücher.

Weisse, Fichte (the younger), Ulrici, Fischer, and Carriere, are considered pseudo-Hegelians, because, though retaining the terminology and general prin- ciples of Hegelianism, they introduce at times an extraneous method and results. Beyond Germany, Hegelianism is represented in France by Vera, in Denmark by Heiberg, and in Sweden by Snellman, Tenström, Brüng, and others, and has not failed to exert an important influence on British and American thought.

HEGESIPPUS, the earliest of the Christian Church historians. He was born of a Jewish family in Palestine about the beginning of the 2d c., but became a Christian at an early age, and a member of the Church of Jerusalem. He went to Rome in the pontificate of Anicetus, visiting upon his journey many churches, and especially that of Corinth, where Primus was bishop. He remained at Rome till the death of Soter (176), and is sup- posed to have died in the year 180. It was during his sojourn in Rome that he composed his history, in five books, entitled Memorials of Ecclesiastical Affairs, which, however, appear not to have formed a continuous history, although they extend from the death of Christ down to the writer's own age. Unhappily, the work, as a whole, has perished, and we know it only from some fragments which Eusebius has embodied in his own History, and the most important of which are his account of the martyrdom of St James and also of St Simeon of Jerusalem. Eusebius speaks highly of the doctrinal fidelity of H., and St Jerome, of the simplicity and purity of his style. Another work on the Wars of the Jews (also in five books), ascribed to H., is confessedly spurious. The most complete collection of the fragments of his writings is that of Gallandus in the second volume of his great collect- ion. See also Grabe, Scripture, tom. ii.; and Fabricius, Bibl. Graec. vii. 156.

HEIFRA. See HEBREW.

HEIDE, a small town in the duchy of Holstein, is situated in Northern Ditmarsh, 32 miles north- west of Glückstadt. It is a pleasant, well- built town, with a large market-place. The inhab- itants employed chiefly in agriculture and general trade. Pop. 6120.

HEIDELBERG, an ancient city of Germany, in the grand duchy of Baden, is situated on the left bank of the river Neckar, in one of the most beautiful districts in the country, on a narrow strip of ground between the river on the north, and the northern extremity of the Geisberg Moun- tains on the south. It is 13 miles south-east of Mannheim, and about 54 miles south of Frankfurt- on-the-Main. The town consists mainly of one street about three miles in length. Among its most important buildings are the Church of the Holy Ghost, through which a partition-wall has been run, and in which service according to the Catholic and Protestant rituals is simultaneously carried on; the Church of St Peter's, on the door of which Jerome of Prague, the companion of Huss, nailed his celebrated theses, at the same time publicly expounding his doctrines before a multi- tude assembled in the churchyard; and the ruins of the castle, which was formerly the residence of the Electors Palatine, and which, in 1764, was set on fire by lighting, and totally consumed. In the cellar under the castle is the famous Heidelberg Tun, 99 feet long and 24 feet high, and capable
HEIGHS—HEIJN.

of containing 800 hhd. H. is celebrated for its university, which, after those of Prague and Vienna, is the oldest in Germany. It was founded by the Elector Ruprecht I, in 1386, and continued to flourish until the period of the Thirty Years' War, when it began to decline. In 1802, however, when the town, with the surrounding territory, was assigned to the Grand Duke of Baden, a new era commenced for the university, and it rapidly became famous. It comprises faculties of theology, law, medicine, and philosophy. In 1858, it had 94 professors and teachers, and 560 students. Its library, to which additions are always being made, consisted in the same year of 150,000 volumes and 3000 manuscripts. As an edifice, it is a plain, and not very large building, near the centre of the town. The Library, the Anatomical and Zoological Museums, and the Museum Club, are separate buildings. Connected with the university are numerous scientific collections, a chemical laboratory, a botanic garden, &c. The trade and manufactures of the town are considerable. The cheapness of living, however, and the beauty of the environs, which are cultivated like a garden, have caused as great many foreigners to settle here. Pop. 15,600.

As the residence of the rulers of the Palatinate, H. underwent all the vicissitudes of that much-suffering electorate. See PALATINATE.

HEIGHTS. Measurement of, may be performed in one of four ways: by the aid of trigonometrical methods; by levelling; by ascertaining the atmospheric pressure at the top and bottom of the height by the barometer; or by ascertaining the boiling-point of water at the top and bottom by the thermometer. At the second and third methods are treated of elsewhere (see LEVELLING AND BAROMETER), the first and fourth alone are here considered. The first method is often more convenient than any of the others, as it does not require the ascent of the height, nor even a near approach to it. There are two cases of the problem:—Case 1 (when there is level ground in front). Let ACD be a height of irregular form, take O and M, two stations on the level ground in front, find the angles AOB, AOC, and measure OM; then as AOM, AMO (which is AMB subtracted from 180°), and OM are known, AO can be found; and since now AO and the angle AOM are known, AB can be found. If the height is regular in form, all that is necessary to be done is to measure OC, calculate CB, find AOB; then AB can at once be calculated by the ordinary rules.—Case 2 (when there is level ground in front). Suppose the height at A above O (fig. 2) is to be found. Take another station M, from which A and O are visible, measure the angles AOM, OMA, and find OM by Levelling (q.v.), then OA can be found; at O take the angle AOB (the angular altitude of A), then from OA and AOB, AB can be known. If the height of one point above another—the latter not being the

observer's station—be required, then the height or depression of the first, and the height or depression of the other above or below the observer's station, must be found separately as before, then the difference (if both are above or both below the observer's level) or sum (if one is below it) of these results gives the number required. For instance (fig. 1), the height of A or AB is first found, CE or the height of E is next calculated, and their difference, AB - CE, or AE, is the height of A above E.

Besides this rigorous trigonometrical method, there are many ways of estimating pretty nearly the height of objects, with little or no calculation. For instance, if the height is perpendicular, and the ground in front on a level with the base, take two pieces of wood, 6 ft. or 7 ft. long, and direct them to the highest angle of 45°; or a large pair of compasses opened to that angle; place one leg horizontal and directed to the base of the object, and move the instrument towards it, or from it, until the other leg point to the top; then the distance of the angle from the bottom gives the height.

The fourth method is often used in measuring the height of mountains when great accuracy is not required, or when the apparatus requisite in applying the other methods is not at hand; all the apparatus required in this method being two thermometers, a tin pot to boil the water, and a book of tables such as those given by Colonel Sykes in Hinta to Travellers. The method depends upon the fact, that vapour of water or steam has a certain tension or elastic force according to its temperature, thus: at 32° it can support 20 ft. of an inch of mercury; at 80° it can support 1 inch; at 150°, 57.4 inches; at 180°, 153 inches; at 212° (the ordinary boiling-point), 30 inches, or the whole pressure of the air. By observing, therefore, the temperature at which water boils, we can find, by means of a table of the elastic force of vapour at different temperatures, the pressure, in inches of mercury, to which it is subject at the time. Now, beginning at the level of the sea, it is found by experiment that a fall of 1° in the boiling-point corresponds to an elevation of 510 feet; at an elevation of 2200 feet, the difference for a degree is 520 feet; at 5000, it is 530 feet; at 17,000, it is 590 feet. An approximation for medium elevations may be made by taking 530 feet on an average for the difference corresponding to 1°, then 530 multiplied by the number of degrees between the boiling-point and 212° will give, approximately, the height.

HEIJN, or HEYN, PETER PETERSEN, a famous Dutch admiral, was born in 1577, at Delfshaven, near Rotterdam. Of low origin, he gradually advanced himself by his abilities and military virtues. As vice-admiral of the fleet of the Dutch West India Company, he in 1626 engaged and
HEILBRON—HEINECCIUS.

utterly defeated the Spaniards in All Saints' Bay, captured 43 of their ships, and returned to Holland with her glory. In consequence of this splendid victory, the Company raised him to the rank of admiral. Only two years after this, he captured, almost without requiring to strike a blow, the grand Spanish silver flotilla, the value of which was estimated at 12,000,000 Dutch guilders. For a reward of this unparalleled success, he was, in 1629, named Admiral of Holland. Shortly after, he met his death in a fight with two ships off Dunkerque. A marble monument is erected to his memory in the new church at Delft.

HEILBRON (formerly, Heilbronn, holy well), an important trading and manufacturing town of the kingdom of Württemberg, in the circle of Neckar, is situated on the right bank of the river Neckar, in a beautiful and fertile valley, 28 miles north of Stuttgart. The church of St Kilian, built from 1013 to 1259, a noble edifice, entirely Gothic and partly Renaissance; the old town-hall, der Diebsbäum—the Thief's Tower—in which Goetz von Berlichingen was confined; and the house of the Teutonic knights, now a barracks, are the chief buildings. Though wine and field and garden produce are still cultivated by many of the inhabitants, trade and manufactures are the chief branches of industry now carried on here. Paper, chemical products, silk, dye-stuffs, gold, silver, and iron wares, tobacco, vinegar, &c., are manufactured for export. Guns and sandstone are quarried in the vicinity. Pop. 14,029.

HEILIGENSTADT, a regularly built and walled town of the principality of Saxony, is situated on the Leine, near the Hanoverian frontier, 50 miles north-west of Erfurt. It was the capital of the duchy of the Harz, in the kingdom of Westphalia, from 1807 to 1814. Weaving, dyeing, and paper-manufacture are carried on. Pop. 3000.

HEILSBERG, a small town of Prussia, in the province of East Prussia, is very beautifully situated on the Alle, 43 miles south of Königsberg. It was originally the chief town of Ermland, one of the old divisions of Poland. Pop. 5000, who manufacture cloth, leather, &c.

HEILSBRONN, a small town in the Bavarian circle of Middle Franconia (pop. 900), worthy of note as the ancient burial-place of the Hohenzollern Burggrafs of Nürnberg. The convent of Heilsbronn owes its origin in 1152 to Bishop Otho of Bamberg, and its present rich endowment to the Counts of Ahenberg, from whom it passed in heritage to the Nürnberg princes, who thenceforward retained the lay-proprietorship of the institution. Nearly all the members of their House were buried here till the end of the 15th c., when it became the burial-place of the Franconian branch of the Hohenzollerns, till their surrender of their Franconian hereditary lands. Since the suppression of the monasteries in 1555, little has been done to keep up the splendour of H.; but the church still retains a large number of highly interesting monuments, at once commemorative of ancient German history, and illustrative of the progress of art in Germany during the middle ages. The village of Heilsbronn, which lies on the Schwäbisch, possesses mineral springs, and has manufactories of wax-cloth and woolen goods. The history and antiquities of Heilsbronn convent have been made the subject of several interesting traverses, of which the most complete is Hocker's Heilsbronnisches Antheistische Nachweis, and stilllified's sequel to the same work.

HEIMSKRINGLA. See Snorre Sturluson.

HEINE, HEINRICH, a modern German poet and wit, was born at Düsseldorf, of Jewish parentage; the date of his birth is variously stated as 1797, 1799, and (by himself) 1800. In 1813, he proceeded to the university of Bonn for the purpose of studying law; but he devoted himself with greater ardour to the study of modern and ancient German literature, under the auspices of his master and friend August Heineccius. Subsequently he studied at Berlin and at Göttingen, at which latter place he took his degree as Doctor of Law in 1825. About this time, he abandoned Judaism, and was baptized in the Lutheran Church of Heiligenstadt. A visit to the Hartz and to Italy supplied him with materials for his Reisebilder (Pictures of Travel, Ham, 4 vols. 1826—1831). This book obtained, on its first appearance, an extraordinary brilliant success, and in which a great number of his countrymen, and at once proceeded to Paris, where he resided for the rest of his life, cultivating belles-lettres, both with a brilliancy and a malice hitherto almost unheard of. In 1835, he married a certain Mathilde, who figures prominently in his writings, and in 1838—1844 visited his native country, to see his mother. On his return, he published Deutschland; ein Wintermärchen (Germany; a Winter's Tale), in which he recounts imaginary adventures and burlesque episodes, and in which a great number of his countrymen, kings, statesmen, professors, authors, artists, &c., are mercilessly satirised and abused. In 1847, H. was attacked by disease of the spine, and was almost constantly bedridden. He suffered almost constant pain, together with great loss of eyesight, with the most remarkable equanimity and even good-humour, till the day of his death, which took place at Paris, February 17, 1856. His will directed that no religious service should be celebrated at his funeral. 'This,' however, he adds, 'is not the weak fancy of a free-thinker. For the last four years, I have cast aside all philosophical pride, and have again felt the power of religious truth.' What faith is to be placed in this assertion, may easily be concluded from his subsequently designating the Deity as the 'mighty Aristophanes of Heaven,' who laugh at his calamities. Besides the works already mentioned, H. wrote Französische Zustände, Der Sarazens, Shakespeare's Mädchen und Frauen, Neue Gedichte, Atta Trott, Romanzero, &c. A complete edition of his works was published at Philadelphia, by John C. Zink, 1856; another in the course of publication, by Hoffmann Campe, in Hamburg. A French edition of his works (Michel Levy, Paris) has been prepared, with his co-operation, by Loeweweins, Gérald de Nerval, and St. RéneTailhard. English versions of some of these are Leland's translation of The Pictures of Travel (Philad. 1856), The Book of Songs, by J. E. Wallis (Lond. 1856), and the Poems of Heine, complete, translated in the original metres by Edgar Allin Bower (Lond. 1859).

HEINECCIUS, JOHANN GOTTLIEB, a learned jurispr of Germany, born 11th September 1681 at
HEIR.

Essenbg, studied theology at Leipsic, and law at Halle, and in 1712 he was made professor of philosophy, and in 1720 professor of law. In the latter capacity, he went in 1723 to Franeker, in 1727 to Frankfurt-on-the-Oder; but in 1733 returned, as professor of law and philosophy, to Halle, where he died 31st August 1741. His works display a thorough acquaintance with all the departments of jurisprudence, but especially with Roman and German law; and their varied learning, logical arrangement, and elegant Latin, long maintained for a classical character. His Antiquitates juris Romanum Illustratwn Symposiwm, has been re-edited so lately as 1841 by Mülhenbruch, and his Elementa Juris Civiles secundum Ordinem Instituti

Rerum in Halle, 1727; H. & H. Gottlieb H., born at Eisenberg 1754, died 11th September 1753, was a noted jurist. He, also the first who studied seals scientifically. His theological writings are forgotten, but he is remembered by his De Vcltoribus Germanorum aliunmque Jurisprudentes Societis (Leipz. 1710; 2 vols.) and by the work edited in conjunction with Leukenfeld, Scriptores Rerum Germanicarum (Frankf. 1707).

HEIR, or HEIR-AT-LAW, in English Law, means the person who, in the event of no will being left by a deceased person which indicates a different intention, is entitled to succeed as heir-at-law, i.e. as the person next of kin, and to the real estate of such deceased person. The term is never used in the loose sense which prevails in Scotland, as including both heirs, properly so called, and executors of the deceased person, as the person next of kin, and to the real estate. The estate, in England or Ireland does not think fit to exercise the undoubted right which belongs to him of leaving his real property by will to whomsoever he pleases, to be enjoyed after his own death, the law steps in, and appoints such a person for him, and this person is the heir-at-law. The law, in selecting these heirs, proceeds on certain fixed rules of primogeniture and relationship, preferring males to females. The eldest son is preferred to all the rest of the family, and his descendants, and the eldest son and his descendants, and so on to the youngest son, after whom the daughters succeed equally or all together, and are then called coparceners. After the descendants of the deceased eldest child, who may be called A, are exhausted, then A's father succeeds; then whom A follow A's eldest brother and descendants; then A's next eldest brother; and so on to the youngest brother; after failure of whom and his descendants, then all A's sisters by the full blood succeed equally as coparceners; then A's halfbrother by the father's side, and descendants, &c.; and then A's half-sisters by the father's side, all as coparceners; after whom succeed A's paternal uncles and aunts in a similar order. Where there are no heirs whose relationship can be traced to the deceased person, then the real estate goes to the crown.

The moment a person dies leaving real estate in England, such real estate vests at once in the heir-at-law, whoever that may be, without any ceremony or formality being required. The heir-at-law, however, takes the property subject to the debts of the deceased, as well as to the estate exonerated, thereby shifting the liability to the personal estate. When the deceased had land which was subject to a mortgage debt, then that debt is a burden on the land, and must be borne by the heir-at-law in the first instance. The law of succession in Ireland is entirely the same as in England. See Succession.

HEIR, in Scotch Law, is often used in a loose sense to denote the persons entitled to succeed to the heritable estate as well as to the movable estate. In Scotland, the same rule exists as in England, that if a person does not by deed mortis causa (which operates like an English will) dispose or convey his estate to some other person, the law points out who is to take such estate, and that person is the heir-at-law. The rules by which the heir to heritable estate in Scotland is pointed out differ considerably from the English rules. These rules are the same as to the descendants of the deceased person A. But after A's descendants are exhausted, differences begin, for then it is not the father, nor yet the eldest brother of A, but the next younger brother of A, who next succeeds; then the next younger brother, until the youngest brother; after whom and his descendants, A's next eldest brother, and so on upwards to the eldest brother of all. In Paterson's Compendium of English and Scotch Law, the different order of succession in both countries is shown in a map. There is also a chart in Scotland as regards heritable estate which has been purchased by a person (in which case it is called Conquest), and who dies leaving brothers both elder and younger: in such case, contrary to the general rule, the eldest brother lives first to the next, and the next brothers, after whose failure the estate goes according to the ordinary rules. In Scotland, when females succeed equally, they are called Heirs-Portioners (q. v.). In Scotland, though not in England, the mother never succeeds in any event, or to any relatives, except brothers and sisters german, who trace through her.

There is also an important difference in Scotland as to the vesting of the heritable estate of a deceased person. At the death of the owner, his heritable estate does not immediately vest in the heir, but remains in an intermediate state, then called hereditas jacens, and the person entitled to be the heir must be served heir, or make up his titles, and enter to the estate. Several rules of feudal barism still exist in Scotland on this subject, though they have been greatly reduced in complexity and expense of late years. The general rule also exists in Scotland, that the heir-at-law takes the estates subject to his ancestor's debts; indeed, he prima facie liable for all the debts, though far exceeding the property left, provided such heir do not take certain precautions to escape this passive representation, as it is called, for the barbarous maxim prevails, heres est eadem persona cum dijuncto. The steps to be taken to guard against liability in such cases are matters of detail not necessary to be described. Another important distinction exists in Scotland, viz., that an heir need not be born in lawful wedlock, as in England, but it is enough if the father marries the mother afterwards, and so legitimates him.

The word ' heir' is often distinguished into several kinds. Thus, an heir by destination is a person who is pointed out by a certain deed to succeed in a certain order. So is an heir of provision. An heir-at-law is also often called an heir of law, because he succeeds according to the ordinar equality of law, and not by an heir-general, because he is the general representative of the ancestor, in contradistinction to an heir-special, who is pointed out by deed. An heir of
HEIR AND EXECUTOR-HEDLER.

dent is the person who succeeds to an entail estate by virtue of the deed of entail, which precedes the death of the deceased. The heir is a person who acquires the estate in question by purchase, and not by succession. See Succession.

HEIR AND EXECUTOR, a short phrase to denote that branch of the law in which a leading distinction is made between the two kinds of property left by a deceased person, viz., real and personal. All a man's property falls under one or other of these heads. If real, it goes to the heir-at-law, if personal, it goes to the executor or administrators, often called the personal representatives.

In Scotland, the same leading distinction exists under the head of heritable and moveable, but in Scotland some things are classed among heritable, which in England would not be classed among real property. Thus, in Scotland, a lease is heritable property, and goes to the heir-at-law, while in England it is personal, and goes to the executor or administrator. So annuities in England are personal, and in Scotland are heritable subjects, and there are other differences not easily to be explained popularly.

HEIR-APPARENT, in English Law, means the person who is certain to succeed if he outlive his ancestor; thus the eldest son is so, unless no other person can ever come between and obtain precedence. In Scotland, the phrase is sometimes used also popularly in this sense, but the words 'apparent heir,' when used technically there, mean quite a different thing, viz., the person, after his ancestor's death, is entitled to succeed, provided he make up his titles, but who has not yet actually done so. The apparent heir has a year to deliberate, called the annus deliberaudi, whether he will enter upon the property, because the responsibility is so much greater in Scotland than in England.

HEIRESS means a female heir when there are no male heirs to succeed. Where there are several females, all sisters, who are in that case equally entitled, they are sometimes called co-heiresses, but more properly coparceners in England, and heirs-portioners in Scotland.

HEIRESS. In Heraldry, a lady is accounted an heiress if she has no brothers who leave issue. The husband of an heiress is entitled to bear arms in an escutcheon of pretence, i.e., a small escutcheon in the middle of this paternal shield, and children of an heiress may quarter her arms with their paternal coat.

Neither practice is of very early introduction in heraldry. See Marshalling of Arms.

HEIR-FAEMLE means the female heir connected through a female.

HEIRLOOM, in English Law, means certain chattels which go to the heir-at-law by special custom, and have already come through several descents. The chattels included are the best of everything, pots, pans, tans, &c. But the right is obscure. The word is more frequently used now to designate some chattel which a testator has bequeathed to the person, whoever he may be, who is to take the real estate. In Scotland, a somewhat similar, but by no means identical phrase is used, viz., heirship movable, which is a wider right, and includes the best articles of furniture in the house of a person who left heritable property. The extent of this right is also not clearly settled.

HEIR-MALE means the male heir connected through a male.

HEIR-PRESUMPTIVE, in English Law, means the person who would succeed if the ancestor were to die immediately, but who may ultimately be displaced if the ancestor live longer. Thus, an only son would be the heir-presumptive of a male, but if a daughter is born, who thereupon displaces her. In Scotland, though the phrase is also used popularly in this sense, yet in its technical sense it means the person who is certain to be heir if he outlive his ancestor.

In short, a presumptive heir in Scotland would be called an heir-apparent in England.

HEIRS-PORTIONERS, in Scotch Law, mean either two or more females, being sisters, or sisters and the children, male and female, of deceased sisters, who are entitled to succeed to heritable estate. Thus, if A dies leaving three daughters, all three succeed equally if alive; or if some had already died leaving children, then the children represent the parent, and succeed to the parent's share along with the surviving sisters, all being called heirs-portioners. In such cases, the eldest heir-portioner is entitled to the mansion-house over and above her equal share of the rest. She alone also takes a peereage or dignity, if there is any in the family. In England, coparceners, though remaining heirs-portioners, have not identical rights. See Paterson's Comp. of E. and S. Law, s. 777.

HEIRSHIP MOVABLES. See HEIRLOOM.

HEL, the northern goddess of the dead, who dwelt beneath one of the three roots of the sacred Yggdrasil, the daughter of the evil-hearted Loki (q. v.), by the giantess Angurboda. Hel, together with her brothers, the wolf Fenrir, and the serpent Jormundgand, was bred up in the giant's home of Jotunheim, where she remained, till at the request of the Zuir, or great gods, the All-father's grandchild, and her and her brothers; when knowing that by their origin these children must prove a great source of calamity, he resolved upon their destruction, and after casting the serpent into the deep ocean, which surrounds all lands, and where it has grown so large that it encircles the whole world, and bites its own tail, he hurled Hel into Niflheim (q. v.), and gave her authority over nine worlds, in which she was to assign places to all who die of sickness and age. Her vast abode is surrounded by a high enclosure with massive gates. Her dwelling is Elindair, dark clouds; her dish, Humr, hunger; her knife, Sult, starvation; her servants, Ganglida, snow-white children of the gods, Kör, sacks of bread, Yggdrasil, splendid misery. She is easily recognised by her fierce aspect, and her half-black, half flesh-coloured skin. Hel was inexorable, and would receive no one who had once entered her domain. See HELTER.

After the introduction and diffusion of Christianity, the ideas personified in Hel gradually merged, among all the races of northern and German descent, in the local conception of a Hell, or dark abode of the dead. See Thorpe's Northern Mythology, Grimm's Mythologie.

HELDER, a thriving seaport and strongly fortified town in the province of Holland, Netherlands, stands on the Marker, which unites the Zuider Zee with the German Ocean, and separates North Holland from Texel. It is 45 miles north-north-west of Amsterdam, with which it is connected by the Grand Ship Canal. See AMSTERDAM. H. is protected from the inroads of the sea by an enormous dyke, six miles in length, 40 feet broad at the top, on which there is a good road, and which presents to the sea a sloping side of 200 feet, inclined at an angle of 45°. This dyke is built entirely of huge blocks of Norwegian granite. There is, however, the whole coast, in the point of land, to which the dyke has been added, a five miles, and at the point where it is extreme, it is 700 feet in length, and 400 feet in breadth. The edge of this dyke is crowned by a wall of 20 feet in height, and 7 feet in thickness, and surrounded with a deep ditch.
which is so great here that no sand is allowed to accumulate. Fort Ketykdn is surmounted by a tower and light-house. In 1859, 536 vessels, of 134,912 tons, entered and cleared the port. Pop. up to 1867, 102,118.

HELEN, the daughter of Zeus and Leda, wife of Tyndares, king of Sparta. According to the ancient legend, she was so exceedingly beautiful, that at the age of ten she was carried off by Theseus and Pirithous, but was recovered subsequently by her brothers, Orestes and Electra. Tyndares afterwards engaged her suitors, who numbered about 30, by a solemn oath, to unite together to aid the husband whom she should chooses, in case of any attempts being again made to carry her off. In accordance with this oath, her husband, Menelaus, when she was afterwards carried off by Paris, son of Priam, king of Troy, summoned all the princes of Greece to avenge the injury he had sustained, and thus gave rise to the Trojan war. The stories concerning the fate of H. are inexhaustible. The ordinary legend states that after the death of Paris, she voluntarily married his brother Deiphobus, and that on the taking of Troy, in order to avert the favours of Menelaus, she invited Deiphobus into his hands. On the fall of Troy, she returned with Menelaus to Sparta; but after his death she was driven to Rhodes, was there murdered by the queen of the island. By her husband Menelaus, she had one daughter, Hermione. Greek artists have represented her in their works as the prototype of female beauty, and she has frequently been celebrated by the tragedians in their dramatic works.

HELENA, the name of several female saints of the Christian church, the most celebrated of whom is the Empress Helena, wife of Constantius Chlorus, and mother of Constantine the Great. The place of her birth is a subject of controversy; according to one account, she was born in Bithynia; but the English Church historians commonly claim her as a native of Britain, to which opinion some probability is added from the fact, that her first-born son, Constantine, was born in that country. She became a Christian during the youth of Constantine, and it is thought not unlikely that her example and her teaching co-operated with public motives in determining Constantine to embrace the Christian religion. It was not, however, till after the defeat of Maxentius, that H. formally renounced paganism. She was at this time far advanced in years; but she survived her baptism for a considerable time, and deserved the gratitude of the Christian community for her zeal for the advancement of religion, and her many acts of piety and munificence. Among the public events of her Christian life, recorded by Catholic historians, the most remarkable is the discovery (according to the belief of the time) of the cross of Our Lord (see Holy Place). She died in the year 329, or, according to another account, in 326. Two other royal or princely ladies of the same name are honoured as saints. The first, whose honours are confined to the Russian Church, was the wife of the Great Duke Igor, and at her baptism in Constantinople (955), changed her original name, Olga, into Helena. She is held in the highest reputation for sanctity in the Russian Church. The other was a native of Skofde, in West Grealand, and lived in the 12th century.

HELENA, Sr., perhaps the best known of all the lonely islands in the world, is situated in the Atlantic, in lat. 15° 55' S, and long. 5° 44' W. Greatest length of the island, 104 miles; breadth, 7 miles; area, 47 square miles. Pop. (1888) 5490. It is 650 miles from the nearest land, the island of Ascension, and about a half more from the nearest point of the African continent. The island was discovered in 1502, on St Helen's Day (22d May), whence its name, by the Portuguese navigator Juan da Nova Catarina. It afterwards belonged to Holland, but her possession, was ceded by Holland about the middle of the 17th c. to the English East India Company, and made over by them to the British crown in 1833. Its value consists in its being a convenient halting-place on the homeward voyage of the China trade — a value enhanced by the fact, that the Cape of Good Hope had, ten years previously, been colonised by the Dutch. On the outward voyage, however, it was not available for sailing-vessels, which, under the influence of the easterly trade-winds, could reach it last only after overshooting it far both to the west and to the south; and this difficulty of access peculiarly fitted it to be the residence of Napoleon Bonaparte, who here lingered in hopeless captivity from 1815 to 1821. The nature of the coast, too, would render a hostile landing next to impracticable, presenting, as it does, either a naturally scarped face of cliffs ranging from 600 to 1200 feet high, or the mouths of ravines protected by forts and other military works. There is one good inlet, called James's Bay, possessing a fine harbour. Here is situated James's Town, the only place of any note in the island.

About 6000 acres—one-fifth of the entire surface—are available for cultivation, but not more than 500 are actually under cultivation; while uplands of volcanic origin, rising in Diana's Peak, in the centre of the island, to the height of 2700 feet, feed large numbers of goats. There are several plains, the largest of which is Longwood, where stands the house in which Napoleon lived. Supplies of provisions, properly so called, are mostly imported, more especially for the „Temple“ population.

HELENSBURGH, a rising town and favourite watering-place of Scotland, in the county of Dumbarton, is pleasantly situated on the right bank of the Firth of Clyde, opposite Greenock, from which it is four miles distant, and 23 miles west-north-west of Glasgow by railway. It was founded in 1777 by Sir James Colquhoun, and named after his wife Helen. In 1858, direct railway communication was opened up between H. and Dumbarton and Glasgow, and since that time the town has greatly increased. Pop. (1861) 4613; but in summer, the numbers are nearly doubled.

HELIACAL RISING (from Gr. helios, the sun). A star is said to rise heliacally when it rises just before the sun. When the sun approaches a star which is near the ecliptic, the star becomes for a season invisible—the heavens being too bright in the quarters of sunrise and sunset, at the times of its rising and setting, to allow it to be seen. But when the sun, progressing in its orbit, separates from the star, and the latter begins to rise first, it in time rises so much earlier than the sun, as just to be visible before daylight. It is then said to rise heliacally.

HELIANTHUS. See Jerusalem Artichoke, and Sunflower.

HELICID.E (Gr. helix, a spiral), a large family of gastropodous molluscs, of the order Pulmonata, and of which Snails (q. v.) are familiar examples. The order is distinguished by having part of the mantle cavity formed into an air-sac or lung. The H. are land snails, and have a spiral shell, into which the body of the animal can be withdrawn. Most of the species pretty much resemble the common snails in their habits, feeding on vegetable substances of various kinds, and often proving troublesome to the farmer and gardener.
HELICON—HELIOS.

HELICON, a mountain, or rather a mountain-range in the south-west of the province of Bceotia, in Greece, may be regarded as a continuation of the range of Pararnassa. It was celebrated by ancient poets as the favourite seat of the Muses. The loftiest summit (now called Paleovidi) is about 5000 feet high. At the bottom of H. stood the village of Ascar, the residence of Hesiod, and the seat of the earliest school of poetry in Greece. In ascending the mountain from Ascar (now Pyrgik), the traveller passes the famous fountain of Aganippe, the waters of which were famed to bestow inspiration, and where are formally handed over to them supposed to have been situated in a hollow at the foot of Mount Mirandali, one of the summits of Helicon. Leake considers that its site is now occupied by the church and convent of St Nicholas. Twenty stadia above this point, a small bottom, is probably modern Makarotiass, where there is still a fine spring.

HELIGOLAND, or HELIGOLAND (Holy Land), a small island in the North Sea, belonging to Germany, is situated about 35 or 40 miles north-west of the mouth of the Elbe, in lat. 54° 11' N., and long. 7° 53' E. It is about a mile long from north to south, and one-third of a mile from east to west, one-fifth of a square mile in superficial area, and containing about 23 houses in circumference. The island consists of an upper and a lower quarter; the former, 'The Oberland,' is a rock 200 feet in height, and 4200 paces in circumference, on which stands a town of 350 houses, and 2680 inhabitants; the latter, 'The Niederland,' is a large field of shore with 69 houses south-east of the cliff, and communicating with it by a flight of 173 steps. The surging of the sea, which has already greatly diminished the size of the island, is fast consuming its shores, and will probably, at no great distance of time, reduce it to a mere sand-bank. H. has two good ports, one on its north, and another on its south side. The inhabitants are supported chiefly by fishing and commerce, by serving as pilots, and by the strangers who visit H. for the excellent sea-bathing. Sandy Island affords a lighthouse stands on the cliff near the village. There is also a prison, but it is never occupied. The annual value of the island is about £5000, and the chief products are lobsters and haddock. H. is an important place in time of war, and commands the German trade in the North Sea. The island, which was taken by the English from the Danes in 1807, and restored to their lawful owner in 1814, has an English governor, but the internal affairs are managed by a council of the islanders. Four batteries, manned by a garrison of British soldiers, are mounted on the cliff. The British establishment maintained on H. costs about £1000 a year. Steam-boats run between this and Hamburg—H. was anciently sacred to the goddess Hethra, and was the island to which the tribe of the Angli, who inhabited the mainland opposite, went to perform religious rites in her honour. On a map discovered by Sir William Gell, the situation of many temples, villages, and large tracts of country, are delineated, all of which were swallowed up by the sea, between 700 A.D., and 1900, according to D'Anville. The sea continued its encroachments, and, before the end of the 17th c., had submerged several churches and monastic establishments. Christianity was first preached here by St Wilfrid in the 7th c., after whose time the island received its present name. Before this, it was called Foestaland, from the Frisian goddess, Foesta, who had a temple here. The inhabitants of H. are divided into two classes, differing both in race and occupation—the one being dealers in the other merchants, cultivators, &c. The first are Frisians, and, true to the habits of their ancestors, the Sea-kings of old, hold land-labour in utter contempt; they are bold and handy seamen, and are remarkable for their great endurance under privation. The merchant class consists of immigrants from Hamburg and other places on the mainland, or their descendants. The Frisian delights to call himself 'an Englishman,' but will by no means allow that title to his neighbour the merchant. The Frisians are a tall, muscular race, simple in their habits; while their marriage and funeral ceremonies are primitive in the extreme.

HELIOCENTRIC, a term in Astronomy, signifying that the sun (Gr. helios) is taken as the centre of reference or view. It is opposed to geocentric, which means that the earth is taken for centre. Thus, the heliocentric place of a planet is its place as seen from the sun: its geocentric, its place as seen from the earth.

HELIODORUS, the earliest and best of the Greek geometric writers, was born at Emessa, in Syria, in the 4th c. B.C. He says that he belonged to a family who were priests of the sun, but that he himself a Christian, and became Bishop of Trikka, in Thessaly. The time and place at which he was born are not known, and by which he is known is entitled Ethiopicus. It was written in his youth, and extends to ten books. It narrates in poetic prose, at times with almost epic beauty and simplicity, the loves of Theageus and Charicleia. The work is distinguished from the later Greek romances more by its original vigour than by its pure morality. The best editions are those of Mitscherlich in his Scriptores Graeci Eroici (1799), and the Greek Cories (Paris, 1804). The Ethiopicus has been translated into most modern languages.

HELOGABALUS. See ELAGABALUS.

HELOI'METER, 'sun-measurer' (from helios, the sun, and metron, a measure), is an instrument invented by M. Bouguer in 1747, by means of which the diameters of the heavenly bodies can be measured with great accuracy. As improved by Dolland, the object-lens of the instrument is in two halves, each of which will form a perfect image in the focus of the eye-piece; and the images may be made to diverge, coincide, or overlap each other, by varying the distance between the lenses. If the diameter of the sun to be measured, the two lenses are adjusted so that the images may touch each other, then the distance between the centres of the two object-lenses and the half-lens gives the diameter of the sun. The merit of the discovery of this instrument was contested by Mr Servington Savery, who had submitted a similar instrument to the Royal Society of London in 1743. Fraunhofer has made many remarkable improvements on this instrument.

HELIOPOLIS SYR'LE. See BAALBEK.

HELIOS, the Greek name of the sun (corresponding to the Roman Sol), who was looked upon and worshipped as a god. He was, according to Homer, a son of the Titan Hyperion, and of Theia or Euryphaessa, and is described by the same poet as giving light both to gods and men. He rises in the east, from the marshy borders of Oceanus, into whose dark abysses he also sinks at evening. The later poets, however, give him a splendid chariot which he races in the east. Colchis describes him as being conveyed, after the termination of the burning labours of the day, in a winged boat of gold, along the northern coasts of the sea back to Colchis. After the time of Aeschyus, he began to be identified with Apollo and the sun-god, but the identification was never fully carried out.
HELIOTROPE—HELL.

His worship was widely spread. He had temples in Corinth, Argos, Troizen, Elia, and many other cities, but his principal seat was Rhodes, where a foot-team was annually sacrificed to him. In addition, it was customary to offer up white lilies and roses on his altars. The animals sacred to him were horses, wolves, cocks, and eagles. Sculpture represents him, for the most part, as riding in his chariot, drawn by four horses.

HELIOTROPE ([*Heliotropium*], a genus of plants of the natural order Boraginaceae (q. v.); of the section, sometimes made a distinct order, *Ehretiaccae*, the fruit separating only when ripe into four carpels. Many of the species have fragrant flowers. The *Peruvian H.* (*H. Peruvianum*), a small shrub, seldom more than two feet high, with oblong-lanceolate wrinkled leaves, and small lilac-blue flowers, is in almost universal cultivation for its fragrance, which resembles that of vanilla. The European or Common H. (*H. Europaeum*), a native of the south of Europe, is known by its large hybrid heliotropes, which are now to be seen in flower-gardens and green-houses, exhibiting great variety in the size and colour of their flowers. They delight in a rich, light soil. The shrublike kinds are generally propagated by cuttings. Large quantities of the flowers are used by perfumers for making scents.—Classical fable accounts for the name H. (*Gr. helios, the sun, and trope, to turn*), by representing Clytie as turned into this flower through gazing at Apollo.

HELIOTROPE AND HELIOSTAT, names applied to instruments used by astronomers for rendering distant stations distinctly visible. This is managed by placing a mirror at the distant station, and adjusting it so that at a particular hour of the day (arranged beforehand), the light of the sun shall be reflected from the mirror directly to the surveyor’s station. The surveyor must make his observation almost at the instant he sees the glancing of the mirror, as the constant change of the sun’s position in the heavens produces a corresponding change in the direction of the rays reflected by the mirror. Gauss (q. v.) invented such an instrument about 1821, which is used abroad, especially in America, for geometric surveys, and is said to possess such power, that a mirror 1 m. square is visible miles off, in average sunny weather, and appears as a brilliant star at a distance of two miles; while some heliotropes have been so powerful as to be visible nearly 20 miles off. The term Heliostat, applied by Captain Drummond to an instrument invented by him for the same purpose, more properly belongs to an instrument invented by S. Gravesande, consisting of an equatorial revolving mirror, and a polar axis, so arranged that when once accurately in the focus of the telescope, continues steadily fixed there. Drummond’s heliostat is chiefly used in Britain.

HELIOTROPE, or BLOODSTONE, a variety of chalcedony or of jasper, of a green colour with red spots. The finest heliotropes consist of chalcedony, and are translucent, at least at the edges; the jasper bloodstones are opaque. H. is found in many parts of the world, as in Scotland, but the finest specimens of this mineral are brought from the southern parts of Asia. It is known to the ancients, who obtained it chiefly from Ethiopia and Cyprus. It is much used for boxes, seals, &c.; and those specimens are most valued in which the ground colour is beautiful, and the spots bright and well distributed. It was much used in the early ages of the Christian Church for the engraving of sacred subjects, the figures being so managed that the red spots should represent drops of blood. Different accounts ascribe the origin of the name H., of none of them satisfactory.

HELL (Heb. *Sheol*, Gr. *Hadès*, Sax. *Hell*, Ger *Höle*), originally a cavern or deep and dark abyss, and sometimes applied (as Gen. xxxvi. 33; Job xiv. 13) to the grave, is commonly used to signify the place, state, or condition of the departed. Many of those who, having failed during life to fulfil the essential obligations imposed by the natural or the positive divine law, are consigned to a state of punishment after death.—The nature of which is variously modified according to the peculiar tenets of each religion—for unexpiated guilt. Among early Christian writers, the word hell is variously employed, sometimes to signify a place of temporary punishment, in which sense it is used by the Roman Catholic Purgatory (q. v.); sometimes the place (*Limbus Patrum*) in which the souls of the just of the old law awaited the coming of Christ, who was to complete their salvation; sometimes the place in which unchristianized children are believed to be detained, on account of the stain of unremitted original sin; and lastly, the prison of those who die stained with the personal guilt of grievous sin. In a many controversies, where it was entirely out of place here, have arisen about the details of this doctrine, as to the place, the nature, and the duration of the punishment of hell. It will be enough to say, that, although according to the literal sense of purgatory one passage of Scripture and the popular notions of the various Christian communities, the place of hell would seem to be assigned to the interior abysmes of the earth, or to the depths of the intermundane spaces, yet even the formularies of the Roman Catholic Church, with all their rigorous precision of detail, and still more those of other communions, have abstained from any formal declaration as to the locality of the punishment of hell. As to the duration of the punishment to which they are subjected, whether it is confined to the ‘pain of loss’—that is, to the remorseful consciousness of having forfeited the presence of God, and the happiness of heaven—or whether and to what degree it further increases the ‘pain of sense,’ there is some difference between the Eastern and the Western churches, and it is sometimes alleged that the Eastern Church altogether rejects the idea of punishment of sense. This, however, is a mistake; both churches agree that the punishment of hell includes the ‘pain of sense,’ the controversy between them having regard not the existence of the pain of sense, but certain questions is to its nature, and especially whether it consists in natural fire, a point which in the decree for the union of the Greek and Latin Churches at the council of Florence, was left undecided. The controversy on the subject of the eternity of the punishment of hell dates from an early period, Origen and his school having taught that the punishment of hell was but purgatorial in its object; that its purifying effect having once been attained, the punishment would cease for all, even for the devils themselves; and that its duration in each case is proportioned to the guilt of the individual. This doctrine of the final restoration of all to the enjoyment of happiness, was the well-known Origenistic theory of the apocatastatics, to
which so many of the early writers refer. It
was rejected, however, by the common judgment of
antiquity, and was formally condemned by the
second council of Constantinople—a condemnation
founded on the literal sense of many passages of
the Scripture (see Matt. xviii. 8; xxv. 41 and 46,
Mark ix. 43; Luke iii. 7; 2 Thess. i. 9; Apos. xx. 10,
&c.); and in the controversy between the Eastern
and Western churches, on the subject of the punish-
ments of hell, the belief of their eternity, in the
most strict sense of the word, was always recog-
nised as a common doctrine of both. In the New
Testament, the name Gehenna is frequently used to
describe the place of punishment of the damned
(see Matt. v. 22, 29, 30; x. 28; xviii. 9; xii. 13;
Mark ix. 43; Luke xii. 5; James iii. 6). The
latter word, indeed, unlike the Hebrew Sheol and
the Greek Hades, is never found in any other signi-
fication than that of the place of punishment of the
sinner after death.

HELL GATE, or HURL GATE, named by the
Dutch settlers of New York Helle Gat, is a dan-
gerous pass in the East River, between Great Barn
Island and Long Island, east of the centre of New
York Island, United States, America. At certain
stages of the tide, there are whirlpools which throw
becalmed vessels on pointed rocks, but these rocks
have lately been removed, and the navigation rendered
safe by a new method of blasting, which
consists in merely sinking the powder on to the
rock, and exploding it by an electric spark.

HELLAS, the original home of the Hellenes,
according to the received opinion, was first a town
and afterwards, under the name of Puthiota, a well-
known district of Thessaly. The ancients also some-
times applied this name to the whole of Thessaly.
With the spread of the Hellenic people southwards
the term embraced a gradually increasing territory
until it came to denote the whole of Middle Greece
or Greece Proper (modern Etruria). At a still
later period, the Peloponnesus itself was included
under the designation; and finally, H. came to be
used in the broadest sense, as comprehending the
whole of Greece, with its islands and colonies.—The
HELLEBORES, or Greeks, as distinguished from the more
ancient Pelasgians, received this name in the belief
that they were descended from a certain Helen.
This mythical personage, a son of Deucalion and
Pyrrha, or, according to others, of Zeus and Dorippe,
and the father of Euxaths, Dorus, and Xuthus, was
said to have been king of Phœnus, to have ruled
over all the country between the rivers Peneus and
Asopus.

HELLEBORE, a name applied to two very
different genera of plants. The genus to which
it more properly belongs, and to which it has
belonged, since very ancient times, Helleborus, is of
the natural order Ranunculaceæ, and is characterised
by a calyx of 5 persistent sepals, often resembling
petals; a corolla of 8 or 10 very short, tabular,
white, or yellow, sweetly-scented petals; numerous
stamens and 3—10 pistils; a leathery capsule, and seeds arranged
in two rows. The species are perennial herbaceous
plants, mostly European, generally with a short
root-stock; the stem mostly leafless, or nearly so,
but sometimes rather leafy; the leaves more or less
evergreen, lobed, the flowers terminal. A familiar
example of this genus is the Black H.—so
called from the colour of its roots—or CHRISTMAS
Rose (H. niger), a favourite in our flower-gardens,
because its large white flowers are produced in
winter. The leaves are all radical; the stalks
generally one-flowered; the flowers white or tinged
with red. Black H. formerly enjoyed a higher
reputation as a medicinal agent than it now
possesses. Melampus is represented as employing
it in the treatment of madness centuries before the
Christian era. The root is the part used in
medicine, and it is imported into this country from
Hamburg, and sometimes from Marseilles. It
consists of two parts—the rhizome or root-stock,
and the fibres arising from it. The former is nearly
half an inch thick, several inches long, and knotty,
with transverse ridges and slight longitudinal strie;
the latter are numerous, cylindrical, brown exter-
nally, and whitish internally. The taste is slight
at first, then bitter and acrid. The chemical com-
position of the root is not very accurately known.
It is not much employed at the present day, but
it has been found of service (1) in mania, melan-
cholia, and epilepsy; (2) as an emmenagogue; (3)
in dropsy—its action as a diuretic and purgative,
and its stimulating effect on the vessels of the liver, render-
ing it useful; (4) in chronic skin diseases; and (5)
as an anthelmintic. Ten or fifteen grains of the
powdered root act as a sharp purgative. The tinc-
ture, which is obtained by maceration in spirit, is
usually given when its action as an emmenagogue
is required. In an excessive dose, it acts as a
narcotic acrid poison, and causes vomiting, purging,
surning pain in the stomach and intestines, faint-
ness, paralysis, and death.—Stinking H. (H. foetidus)
grows on hills and mountains in the
south and west of Europe, in some of the chalk
districts of England; and in several places in Scot-
land. It has a very disagreeable smell, and green
flowers somewhat tinged with purple. The stem is
many-flowered and leafy.—GREEN H. (H. viridis),
also found in the chalk districts of England, has
a leafy stem, with a few large greenish-yellow
flowers. The celebrated H. of the ancients was
probably a species peculiar to Greece and the
Levant, H. orientalis or H. officinalis; all the
species, however, have similar medicinal qualities.
From the abundance of the plant around the city
of Anticyra, hypochondrial persons were said to
need a visit to Anticyra.—Closely allied to the
genus Helleborus is Eranthis, in which the flowers
are surrounded with an involucre, and have a
delicious calyx. A well-known species is the
WINTER H., or WINTER ACONITE (E. hyemalis), of
our gardens, whose yellow flowers, raised only a
few inches above the ground, deck the flower-
border about the same time with snowdrops. It
is a native of the midland parts of Europe, but
Christmas Rose (Helleborus niger).
naturalised in many parts of Britain. It loves shady places.

White H. (Veratrum album) belongs to the natural order of Melanthiaceae, and is the Hallumus flower, with 6-leaved perianth, 6 stamens, 6 pistils colouring at the base, a 3-lobed capsule separating into 3 many-seeded follicles, and compressed seeds winged at the apex. White H. has a leafy stem, somewhat above 4 feet high, ovate-oblong, and terminal compound panicle, and yellowish-white flowers. It abounds in the mountains of the centre and south of Europe, but is not found in Britain. The root was once much used in medicine, but now neglected, although it seems to act poisons in some diseases. It is a very acrid and active poison. Its powder is used to destroy lice, and by gardeners for killing caterpillars. A decoction and ointment of it are sometimes used in itch and ring-worm. Caution is necessary even in handling the powder of White H., and very unpleasant effects ensue from its getting into the eyes or nose.

-American H., or Swamp H. (V. viride), known also as Indian Poke or Ithi Weed, is a root used in damp grounds from Canada to Carolina. Its root has properties similar to those of white helledge. These properties seem to depend chiefly on an alkaloid called Feratra.

HELLENISt—HELLENIST. The name given to those among the Jews, and afterwards in the Christian Church of Judea, who, either by birth or by residence, and by the adoption of the Greek language, manners, and usages, were regarded as Greeks, in opposition to the Hebrews properly so called, whether of Palestine or of the Dispersion. The name has sometimes been improperly restricted to persons of Greek parentage or descent; but like other Gentile names of the same form, it marks a distinction by the peace, and not the language, of Greece rather than by Greek descent. The Hellenists, in this sense, formed a distinct body, and stood in a relation of rivalry, if not of antagonism to the Hebrews (see Acts vi. 1, and ix. 29). There is also a clear distinction between Hellenism (Greeks—from Hellas, q. v.) and Hellenists. The latter might, it is true, be Hellenes by birth, but the prominent idea conveyed by the name was rather the adoption or affection of Greek manners and language than Greek parentage or blood.

At the time of our Lord's crucifixion, the Jews of the Dispersion were to be found in almost every part of the Roman empire; but it was among the Jews settled in Alexandria that Hellenism has had its freest development; and it is to that city that we must refer the formation as well of that peculiar dialect of the Greek language which is known as the Hellenistic, as of that singularly acute and speculative philosophy which exercised so large an influence on those early Christian schools, of which Origen is the most famous exponent.

The really characteristic element of the Hellenistic Greek consists in its foreign, and especially its Hebrew and Aramaic words and idioms. Although it was in its origin a purely popular form of the language, yet its being employed in the Alexandrian or Septuagint version of the Old Testament, has given to it all the fixedness and definite character of a written language. The Hellenisms of the Septuagint differ in many respects from those of the New Testament, which again present some points of discrepancy with those of the Alexandrian Fathers; but there are certain leading characteristics common to them all, which constitute the distinctive forms of the dialect, and which may also be described as peculiarities of structure and forms of thought derived from those Hebrew or Aramaic
HELMET—HELMONT.

heraldry: 1. The helmet assigned to the king and princes of the blood-royal, which is full-faced, composed of gold lined with crimson, and has the visor divided by six projecting bars. 2. The helmet of the nobility, of steel, with five bars of gold. When placed on the shield, it is exhibited in profile. 3. Knights and baronets have the full-faced steel helmet with the visor thrown back and without bars. 4. The helmet of esquires, always represented in profile, of steel with a special crest. Those distinctions are of comparatively recent date. A much greater variety of helmets is in use in continental heraldry. A helmet is never placed over the arms of any woman except the sovereign.

HELMET, a covering of metal or leather to protect the head in warfare. The earlier Greek and Roman helmets, as shown by many extant sculptures, were surmounted by plumes, but unlike their modern successors, did not protect the face. During the middle ages, helmets were made of the finest steel, often inlaid with gold, and provided with bars and flaps, to cover the face in action, and to allow of being opened at other times. As the employment of firearms became more general, helmets naturally lost their utility, especially as regarded the face. Those still remaining are in military matters limited for the most part to heavy cavalry, affording no protection to the face, and must be considered as rather for ornament than use. Firemen wear a heavy head-piece of leather and brass, to protect them as far as possible from falling ruins at conflagrations. In India and other hot climates, helmets of white felt, with the additional screen of rolls of linen, are constantly worn by military men, to protect them from the rays of the sun.

HELMHOLTZ, HERMANN, one of the most distinguished scientific men of the present day, was born at Potsdam, in August 1821. He was at first a surgeon in the army, then assistant in the Berlin Anatomical Museum, and has since been professor of physiology, from 1849 at Königsberg, from 1855 at Bonn, and from 1858 at Heidelberg. Holding a very high place among physiologists, H. is no less distinguished in experimental and mathematical physics. His physiological works are principally connected with the eye and the nervous system. Thus, we have his exhaustive treatise on Physiological Optics, his Speculum for the Examination of the Retina, his Discourse on Human Vision; and various papers on the means of measuring small periods of time, and their application to find the rate of propagation of nerve-disturbances. Of a semi-physical nature we have his Analysis of the Spectrum, his explanation of Vowel Sounds (Klangfarbe der Vökel, see Sound); and his papers on the Conservation of Energy with reference to Muscular Action. In physical science, he is best known by his great paper on Conservation of Energy (Über d. Erhaltung d. Kraft, Berlin, 1847, translated [loosely] in Taylor's Scientific Memoirs, an admirable lecture on the same subject (Königsberg, 1854); and by two masterly mathematical memoirs in Crelle's Journal, on Vortex-motion in Fluids, and on the Vibrations of Air in open pipes, respectively.

HELMONT, JAN BAPTISTE, Lord of Merode, Royenburch, Oorschot, and Pellines, an eminent Belgian chemist, was born at Brussels in 1677, and died near Vilvorde in 1674. He went through the regular course of study at the university of Louvain, and on the completion of his education, he was offered and accepted the chair of surgery in that university, the duties of which he discharged for two years. The study of the works of Paracelsus seemed to have turned his attention to chemistry and natural philosophy, and in the pursuit of these sciences he spent several years in the different universities of Louvain and France; after which he returned home, married Margaret van Ranst, a noble lady of Brabant, and settled down at his estate near Vilvorde, where he spent the remainder of his life. His chemical investigations of various kinds. It would be impossible, in the limits of this article, to sketch even an outline of his chemical discoveries. Writers of the history of chemistry regard him as the greatest chemist who preceded Lavoisier; and it is much to be regretted that his language is often so obscure, that it is not always easy to ascertain his meaning. He was the first to point out the imperative necessity for employing the balance in chemistry. He paid much attention to the study of the gases, and is supposed by some authorities to have been the first to apply the term gases to elastic, or fluid fluids. Of these gases he distinguished several kinds. He was also the first to take the melting-point of ice and the boiling-point of water as standards for the measurement of temperature. By means of the balance he shewed, in many instances, the indestructibility of matter among chemical changes. For example, he demonstrated that a salt dissolved in water, or silver dissolved in aquafortis, could be recovered unchanged in quantity. It is in his works that the term saturation is first employed, to signify the combination of an acid with a base; and he was one of the earliest investigators of the chemistry of the fluids of the human body.

Along with other physiologists of his day, he speculated much on the seat of the soul, which he placed in the stomach. His reasons are chiefly these two: 1. It cannot exist in the brain, because that organ contains (according to H.) no blood; 2. It does exist in the stomach, because when we hear bad news, we lose our appetite. Those who wish to know the full value of his contributions to the knowledge of chemistry, may consult the Histories of Chemistry written by Kopp and Hofé.

The most important of his works is his Orth Medicinae, id est initia Physicæ inutilis, progressum Medicinae novus in morborum sibiōn. ad vitam longam, which was published by his son four years after his death, passed through a very large number
Helmstedt—Helsingfors.

Helmstedt, a town in the north of Germany, in the duchy of Brunswick, 22 miles east-south-east of the city of that name, was formerly famous for its university, founded here by Julius Duke of Brunswick in 1573, and supported by Jerome Leopold of Nassau in 1589. The university buildings now serve as court-houses. Manufacturers of hannel, soap, hats, and grain-spirits are carried on. Here the first Saxons were baptized by St. Ludgarna. Pop. 6,700. H. was formerly a member of the Hanseatic League.

Helmund, a river of Afghanistan, rises 35 miles to the west of Cabul, at an elevation of 11,500 feet. After a south-westerly course of about 650 miles, it loses itself in the salt lake of Seistan or Hamoon by several mouths, about 30° 20' N., and long 62° E. The immediate banks, generally bordered by deserts on either side, abound almost everywhere with traces of former cultivation and wealth. Like tropical rivers in general, the H. varies largely in volume according to the season, being, being, thrice as deep and broad in the rainy season as it is at other times.

Heloise. See Abelard.

Helots. The population of ancient Sparta was divided into four classes, the lowest of which was formed of serfs or slaves, called Helots (probably meaning captives, from Gr. keleis, to capture). These Helots are generally supposed to have formed the original population of the country, and to have been reduced to bondage by their Dorian conquerors, the numbers, however, being swollen from time to time by the conquest of enemies. They belonged to the state, which had the power to set them at liberty; but they toiled for individual proprietors, and were bound to the soil, i.e., they could not be sold away from the place of their labour. They were the tillers of the land (for which they paid a rent to their masters), they served at the public meals, and were occupied on the public works. In war, they served as light troops, but bore the heaviest of the baggage, the body being accompanied to battle by a number of them, sometimes as many as seven. On rare occasions they were used as heavy armed soldiers. It is a matter of doubt whether after emancipation they could ever enjoy all the privileges of Spartan citizens. They were treated with much severity by their masters, and were subjected to degradation and indignities. They were whipped every year, to keep them in mind of their servile state; they were obliged to wear a distinctive dress (clothes of sheepskin, and a cap of dog's skin); to intoxicate themselves, as a warning to the Spartan youth; and when multiplied to an alarming extent, they were executed by law with the most barbarous cruelty. On one occasion, 2000 of them, who had behaved bravely in war, were encouraged to come forward for emancipation, and were then most treacherously put to death. The Spartans organized, as soon as necessity required, a military service of this class. (Gryphyes) of young men, who went abroad over the country armed with daggers, and both by night and day assassinated the unfortunate Helots, selecting as their special victims the strongest and most conspicuous of the oppressed race.

Helps. Arthur, an English essayist and historian, was born about 1811, and was entered at Trinity College, Cambridge, where he took the degree of B.A. in 1835. On leaving the university, he obtained a post in the civil service, and on his resignation, he retired to Bishop's Waltham, in Hampshire, where, in the possession of ample means, he enjoyed a lettered ease. His Conquerors of the New World and their Bondmen appeared in 1848, and his Theopyle of 1850. His subsequent works are—Outlia, a play; *Spain's Conquest in America (1855—1857); *Friends in Council, 2d series (1859); and an Essay on Organisation. At present (1862) he holds the important post of secretary to the privy council.

H. is the most delightful essayist since Lamb and Hunt. He everywhere exhibits acuteness, humour, a satire which gives no pain, and a quiet depth of moral feeling which, in itself, is an earnest recognition of man's social responsibilities, while his style, in qualities of purity and clearness, can hardly be matched amongst his contemporaries. His historical works are of great value, containing all the merits of his essays, with a breadth of view and a mastery over details which are as rare as his style.

Helsingfors, a fortified seaport of Russia, capital of the government of Finland, and after Cronstadt, the most important naval station on the Baltic, is beautifully situated on a peninsula surrounded by islands and rocky cliffs, in the Gulf of Finland, 191 miles west from St. Petersburg by sea. A series of formidable batteries, called the fortifications of Sveaborg, and consisting of seven strongly fortified islands and numerous islets, protect the entrance to the harbour, and are of such strength, and so well appointed, as to warrant the application to them of the name of the Northern Gibraltar. The whole is defended by the success works is about a mile in length, and, besides the casemates for small-arms, the united fortresses mount about 1000 guns, and are garrisoned by 12,000 men. The harbour itself is further defended by two forts. One is in the largest and wealthiest town of Finland; the broad streets, consisting of houses painted externally yellow and green, intersect at right angles, and there are several fine public squares. Of the public buildings, the most striking are the residence of the governor, the senate-house, and the university buildings. The university, removed hither from Abo in 1829, where it had been founded in 1640, comprises five faculties, has 60 professors, and generally about 600 students. In connection with it are a library of 80,000 volumes, a hospital, a botanic garden, and a valuable observatory. Since 1840, H. has been a favourite bathing-place, and attracts many visitors during summer from St. Petersburg. The town carries on a considerable trade in Baltic produce; it exports chiefly corn, fish, deals, and iron; and manufactures sailcloth and linen. Pop. 14,160.

H. was founded by Gustarius I. of Sweden in the 16th c., but the site of the town was removed nearer the shore in 1639. In 1819, it became the capital of Finland. During the late Russian war, Sveaborg was bombarded for two days and nights (9th and 10th August, 1855) by a section of the allied fleet, without any material impression being made upon the forts.
HELST, BARTHOLOMEW VAN DER, a Dutch painter, was born at Haarlem in 1613, and died at Amsterdam in 1670. He attained great celebrity as a portrait-painter, and his works were numerous in Holland; one in particular (in the Chamber of Justice at Amsterdam), representing thirty full-length figures of a train-band with the Spanish ambassadress in the midst, was pronounced by Sir Joshua Reynolds to be 'the first picture of portraits in the world.'

HELSTONE, an old market-town and municipal and parliamentary borough in the county of Cornwall, England, is pleasantly situated on an elevation, at the head of a pretty valley opening to the sea, about 10 miles west-south-west of Falmouth. It was made a borough by King John in 1201, and from the reign of Edward I. to the passing of the Reform Act, it sent two members to parliament. May-games, or Floralia, once common throughout England, are still kept up here. Pop. (1861) municipal borough, 3841.

HELVELLA, a genus of fungi, of the order Ascomycetes (see Fungi), closely allied to morels, but differing from them in having the pileus turned downwards, lobed and folded, and the surface of the hymenium even. Some of the Helvelle are edible, and much used in Germany.

HELVELLYN, one of the highest mountains of England, in the lake district, Cumberland, between Keswick and Ambleside. It is 3035 feet high, is easy of ascent, and commands magnificent views of the surrounding country.

HELVETIC CONFESSIONS. See CREEDS AND CONFESSIONS.

HELVETIA, a Celtic people inhabiting, according to Caesar, the region between the mountains of Jura on the west, the Rhone on the south, and the Rhine on the east and north, the region corresponding pretty closely with modern Switzerland. They had 12 towns and 400 villages. The great and fatal event in their history is their attempted irruption into and conquest of Southern Gaul, in which they were repulsed by Caesar with frightful slaughter. The story of this expedition is circumstantially narrated by the Roman commander. They collected three months' provisions, burned their twelve cities, 400 villages, and all isolated dwellings, and made a general rendezvous by Lake Lemano in the spring of 58 B.C. Caesar hastened to Geneva, destroyed the bridge, raised two legions in Cisalpine Gaul, and when the Helvetians sent delegates to demand a passage, delayed them until he had built a wall along the Rhone, 16 feet high and about 19 Roman miles in length, flanked with redoubts. Having vainly attempted to pass this barrier, the H. took another route, but were followed and defeated with a terrible slaughter at Bibracte (modern Autun, in Burgundy), and the remnant obliged to return to their own country, where they became subject to the Romans. Of 368,000 who left their homes, including 92,000 fighting-men, only 110,000 returned. In the commotions which followed the death of Nero, the Helvetians met with another terrible catastrophe. Remaining faithful to Galba, they were fallen upon by Sacca, a general of Vitellius, who gave them to the capacity of his legions. They were murdered by thousands, mutilations were sold to slaver, and their towns pillaged and burned, their capital destroyed, and their governor executed. From this time they scarcely appear as a distinct people.

HELYTIUS, CLAUDA-ADRIEN, a young from a family of Swiss origin, as the name Helvetius implies, and recemly resided in Paris in 1715, and received a careful education. Intended for a military career, he was sent, after the conclusion of his studies, to his uncle, D'Armancourt, Director des Fermes, at Caen; a practical knowledge of the subject, and at the age of twenty-three was appointed to the lucrative office of Fermier-Général; but the oppressive nature of the duties which it involved was not at all to the liking of H., who was of a very hot temper, and he quickly resigned it for the situation of Chamberlain to the queen's household. He now led, like every other courtier of his time, a life of mere gallantry, which looks ridiculous enough at this distance of time; but happily he was soon worn out by it, and after more than a year of the most beautiful and accomplished daughter of Comte de Ligneville, he withdrew to a small estate at Voré, where he spent the most of his life in the education of his family, the improvement of his estate; and the service of his country. In 1772, his celebrated work, De l'Esprit, in which he endeavours to prove feeling (sensibilité) to be the source of all intellectual activity, and that the grand level of all human conduct is moralization. But he advices them in the same time, that self-satisfaction, as it was in the past, assumes different forms; e.g., the self-satisfaction of a good man consists in the subordination of private to more general interests—first, to the circle among them; and if they would become better, to the world at large. The philosophy of the book is, of course, materialistic. It was denounced by the doctors of the Sorbonne, and condemned by the parliament of Paris to be publicly burned. H. was much disgusted, and in 1764 left France to return England and Germany, where Frederick II. received him with distinction. He died at Paris, 26th December 1771, leaving behind him a work, De l'Homme, de ses Facultés, et de son Éducation, which was published by Prince Galzy (2 vols. London, 1772). Among the editions of his collected works, two deserve special notice, both published at Paris in 1798, the one in five and the other in thirteen volumes. His wife, who survived him many years, resided at Antwerp, near Paris, where she was visited by the most distinguished personages, and is often mentioned in the memoirs of that brilliant period.

HEMANS, FELICIA DOROTHEA, an English poetess, was born at Liverpool, 25th September 1793. In her early age she manifested a taste for poetry, in which she was encouraged by her mother. Her first volume was published in 1808, when she was only 14 years of age, and contained a few pieces written about four years earlier; her second, entitled The Domestic Affections, appeared in 1811. In the same year she married Captain Hemans of the 4th Regiment, whose health had suffered in the retreat on Corunna, and afterwards in the Walcheren expedition, and who found it necessary a few years after to remove to Italy. After that period they never met. Although five sons were born of this marriage, it was not understood to have been happy. Mrs. H. spent the rest of her life in North Wales, Lancashire, and latterly in Dublin, where she died, 28th April 1836. Her principal works are...
_The Vespers of Palermo_, a tragedy (1823); _The Siege of Valencia_, The Last Constable, and other Poems (1823); _The Forest Sanctuary_ (1827); _The Songs of the Affections_ (1830); and _Hymns for Childhood, National Lyrics and Songs for Music_, and _Scenes and Hymns of Life_. A volume of _Poetical Remains_ was published after her death, and subsequently a complete edition of her works, with a memoir by her sister, was issued by Misses Blackwood.

Mrs H., without great daring or force, is sweet, natural, and pleasing. But she was too fluent, and wrote much and hastily; her lyrics are her best productions; her more ambitious poems, especially her tragedies, being, in fact, quite insipid. Still, she was a woman of true genius, and one or two of her little pieces, _The Graces of a Household, The Treasures of the Deep, The Homes of England_, and some others, are perfect in pathos and sentiment, and will live as long as the English language.

**HEMEROCALLIS—HEMLOCK.**

**HEMEROCALLIS.** See DAY-LILY.

**HEMIBRANIA** (Gr. hemi, one-half, and kranios, the skull; Fr. migraine; Eng. migraine), a variety of Headache (q.v.), distinguished by its affecting only one side at a time, and also frequently by its intermitent character; whence it has been termed, not very accurately, Brow-ague.

**HEMIDESMUS,** a genus of plants of the natural order Acanthaceae. The root of _H. Indicus_ is used in medicine, chiefly in India, and is known as Indian sarsaparilla. It is in some cases a good substitute for sarsaparilla, and appears to derive its properties from a crystallizable and volatile principle called Hemidesmin or Hemidesmic Acid. The plant is a climbing shrub, with leathery leaves and axillary umbels of flowers. It is common in almost all parts of India.

**HEMIPRIA** (Gr. hemi, one-half, and opa, the eye), vision limited to one-half of an object—a peculiar and rare form of disease, very imperfectly understood.

**HEMIPLEGIA** (Gr. hemi, one-half, and plēsko, I strike), Paralysis (q.v.) limited to one side of the face and body, and usually depending upon disease of the brain. Opposed in signification to _Paraplegia_ (q.v.).

**HEMIPODE** (Hemipodius), a genus of gallinaceous birds, nearly allied to quails, but distinguished by a more slender beak, and by the want of a hind-toe. They are the smallest of gallinaceous

**HEMIPTERA** (Gr. half-winged), an order of insects, with four wings, a mouth formed for sucking, undergoing imperfect metamorphoses, and having the first pair of wings either of a firm membranous substance without scales, or leathery at their base, and membranous at their tips. Those with the first pair of wings of the former character are the order Homoptera (q.v.) of many entomologists; the latter are the _Hemiptera_ proper, the section or sub-order Heteroptera of Cuvier and others. The wings of the _H._ proper in general partly overlap each other, and are horizontal or slightly inclined when at rest. Some kinds are wingless, which, however, otherwise exhibit the characters of this order. Some of the _H._ feed on vegetable, and some on animal juices. The principal changes which they undergo in their metamorphoses are increase of size and development of wings. They are active in all stages. Some of them are aquatic. They are most abundant in tropical countries, and some of the tropical kinds are very splendid. Examples of this order are bugs, water-bugs, boat-flies, and water scorpions.

**HEMISPERIUM**, the half of a sphere, when it is bisected by a plane passing through its centre.

**HEMLOCK** (Conium), a genus of plants of the natural order _Umbellifera_, having compound umbels of small white flowers, small general and partial involucres, the limb of the calyx merely rudimentary, and a compressed ovate fruit with five prominent wavy ridges and no _vittae_. The best known and only important species is the _Common H._ (C. _maculatum_), which grows by waysides, on heaps of rubbish, and in other similar situations in Britain. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, 2–7 feet high, generally spotted with dark purple; the leaves large, tripinnate, of a dark shining green colour; the leaflets lanceolate, pinnatifid. All parts of the plant are perfectly destitute of hairs, and it is the only British species of the order _Umbellifera_ which has the stem smooth and spotted with purple. Both the general and partial umbels have many rays. The general involucres consist of several small leaflets; the partial involucres of three small leaflets, all on one side. The whole plant has a nauseous smell, particularly if rubbed or bruised.

---

Flowers and Root of Common Hemlock _Conium maculatum_.

c, a flower; d, a seed.

_and on the continent of Europe, in some parts of Asia, and now also as a naturalised plant in North America and in Chili. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, 2–7 feet high, generally spotted with dark purple; the leaves large, tripinnate, of a dark shining green colour; the leaflets lanceolate, pinnatifid. All parts of the plant are perfectly destitute of hairs, and it is the only British species of the order _Umbellifera_ which has the stem smooth and spotted with purple. Both the general and partial umbels have many rays. The general involucres consist of several small leaflets; the partial involucres of three small leaflets, all on one side. The whole plant has a nauseous smell, particularly if rubbed or bruised._

Andalusian Hemipode _Hemipodius tachydrus_.

Birds, and inhabit cultivated grounds and sterile sandy plains in warm countries. One species, the _Andalusian H._ (H. _tachydrus_), is found in Spain, Italy, Sicily, Africa, and Australia. Its whole length is about six inches.
HEMLOCK SPRUCE—HEMP.

The leaves are the only part of the plant employed in medicine. They should be gathered just before the time or at the commencement of flowering, and after the removal of the larger stalks they should be quickly dried by a heat not exceeding 120°. They should then be preserved in perfectly closed tin canisters. As, however, the dried leaves sometimes yield no conia, complex, or conine (a volatile alkaloid, which is the active principle in the plant), these fresh leaves are much more certain in their action.

The most important ingredient in H. is the conia, which is more abundant in the fruit (seeds) than in the leaves. From 40 lbs. of the ripe but green seeds, Dr. Christie son obtained two ounces and a half of hydrated conia. As it is volatile, it is obtained by distilling the seeds with water which contains a little potash in solution; conia, then, passes over with the water in the form of a yellowish oil, and when purified by redistillation, it is obtained as a colourless, transparent, oily liquid, having a specific gravity of 0.8, a penetrating, hemlock-like odour, communicating a burning sensation when applied to the tongue, and acting as a very energetic poison. It exhibits a powerful alkaline reaction, and precipitates many metallic oxides from their salts. Strong sulphuric acid causes its compounds to assume first a purple-red and then an olive-green colour; while nitric acid gives a blood-red colour, fading into an orange. Its composition is represented by the formula $C_{10}H_{13}N$. Wertheim has recently discovered a second alkali in H., which contains the elements of two equivalents more of water than conia. This substance, whose formula is $C_{10}H_{13}NO_3$, he names conelvin. It may be sublimed in beautiful colourless needles, and is much less poisonous than conia.

Conia has been introduced into the Pharmacopoeia Norvegica under the name of Coninium, the dose being from the one-fourth to the one-sixtieth part of a grain. The following illustrations will give an idea of its activity as a poison: One drop placed in the eye of a rabbit killed it in nine minutes; three drops employed in the same way killed a strong cat in a minute and a half; while five drops poured into the throat of a small dog began to act in thirty seconds, and in as many more, motion and respiration had ceased. It seems to exhaust the energy of the spinal cord, and thus to cause muscular paralysis.

The application of H. in medicine may be arranged under two distinct heads: 1. Those which depend upon its resolvent and alternative powers; and 2. Those which have reference to its influence over the nervous system. 1. It has been found useful in mammary tumours and profuse secretion of milk, in bronchocele, in enlargements of the liver, spleen, and pancreas, in acrofulous affections, &c., and at one time had a high reputation in cases of cancer. 2. It is useful as an antispasmodic and anodyne in hooping-cough, spasmodic cough generally, asthma, neuralgia, &c.

In large or poisonous doses it sometimes gives rise to coma (such as opium does), and sometimes to convulsions or violent delirium. Korchrrel relates the following singular instance of delirium from its use: Two priests ate hemlock-root by mistake; they became raving mad, and fancying that they were geese, plunged into the water. For three years they were afflicted with partial palsy and violent pain.

It may be administered internally in the form of powder of the leaves, tincture, or extract, while externally it may be applied as a bathing application to ulcers, painful piles, &c., in the form of ointment or poultice. The conia being volatile, often escapes from the powdered leaves and from the extract, and of the three preparations named, the tincture is the best. The sucres conia, or Preserved Juice of Hemlock, prepared by Boltley and other pharmaceutical chemists, is more certain in its action than any of the pharmaceutical preparations.

In cases of poisoning by H., the evacuation of the stomach is the first thing to be attended to. Among the ancient Greeks, poisoning by H. was a common mode of death for condemned criminals, and thus it was that Socrates died; but whether it was the juice of the Common H. or the Water H. that was used, is unknown.—Water H., or Cowbane (Cicuta virosa), is also an umbelliferous plant of a genus having much vaulted umbels, a 5-toothed calyx, and almost globose fruit, each carpel with five broad flattened ribs and evident single suture. Water H. grows in ditches, the margins of ponds, and wet grounds in Europe and the north of Asia. It is more common in Scotland than in England. It has a large fleshy white root, covered externally with fibres; an erect much branched stem, 2–3 feet high; tripartate leaves, with the procurs-lanceolate regularly and sharply serrated leaflets, no general involucres or only a single small leaflet, partial involucres of many short narrow leaflets, and white flowers. It is a virulent narcotic acid poison. Serious accidents have occurred from eating the root. Another species, C. maculatus, is common in North America, growing in marshy places. It has a spotted stem, like that of true H., the name of which it very generally receives in North America. The leaves are tri-terinate, the leaflets ternate. It is a very poisonous plant, and is the cause of many deaths.—Cicuta, in Latin, seems to have been the name of the same plant called Con-ion by the Greeks, but it is not known whether this or the previous plant was so denominated.

HEMLOCK SPRUCE. See Frn.

HEMP (Con'namhi), a genus of plants of the natural order Cannabisaceae (q. v.), having the male and female flowers on different plants: the male flowers with 5-petite calyx and 5 stamens; the female flowers with a spathlike calyx of one leaf, rolled round the ovary and papillate along one side, and two threadlike stigmas. There is only one known species (C. sativa), varying considerably,
HEMP—HEMPS.

However, from soil, climate, and cultivation. It is an annual plant, a native of the warmer parts of Asia, but has been cultivated in Europe from the earliest historic times, and is now naturalised in many parts of Europe and America. Like flax, it wonderfully adapts itself to diversities of climate, and is cultivated equally under the burning sun of the tropics, and in the northern parts of Russia. It is, however, readily injured by frost, particularly when young; and in many countries where it is cultivated, it succeeds only because their summer is sufficient for its whole life. H. varies very much in height, according to the soil and climate, being sometimes only three or four feet, and sometimes fifteen or twenty feet, or even more. Notwithstanding the nettle-like coarseness of its leaves, it is an elegant plant, and is sometimes sown on this account in shrubberies and large flower-borders. The stem is erect, more or less branched; the leaves are 5—9-fingered. The flowers are yellowish green, small, and numerous; the male flowers in axillary racemes on the upper parts of the plant; the female flowers in short, axillary, and rather crowded spikes. The female plants are higher and stronger than the male, for which reason the female plants are popularly known in Germany as Machtelhosen, and the male as Femelhosen, the names being derived from the Latin man and femea, and perpetuating an error which probably is as old as the time of the Romans. The stem of H. is hollow, or only filled with a soft pith. This pith is surrounded by a tender, brittle substance, consisting chiefly of cellular tissue, with some woody fibre, which is called the reed, boon, or shore of hemp. Over this is the thin bark, composed chiefly of fibres extending in a parallel direction along the stalk, with an outer membrane or cuticle.

H. is cultivated for its fibre in almost all countries of Europe, and in many other temperate parts of the world; most extensively in Poland, and in the north and south of European Russia, which are the chief hemp-exporting countries. French H. is much esteemed in the market, as is also that of England and Ireland, of which, however, the quantity is comparatively inconsiderable. Botany of H. and Hempish. H. are varieties remarkable for their height; and a fibre of very fine quality, eight or nine feet long, is known in commerce by the name of Italian Garden Hemp. In Britain, the cultivation of H. is almost confined to Lincolnshire, Holderness, and a few other districts of England, of which the most alluvial soil is particularly suited to it. In cultivating H., it is very necessary to have the soil so rich, and to sow the seed at such a season, that the plants shall grow rapidly at first, as they thus form long fibres. A crop of short-scrubly H. is almost worthless. The finer kinds of H. are used for making cloth; the coarser, for sailcloth and ropes. H. sown thin produces a coarser fibre than H. sown thick. Some hemp is sown short on the time of pulling, for the crop is pulled by the hand. When a rather fine fibre is wanted, and the seed is not required, the whole crop is pulled at once, soon after flowering; otherwise, it is usual to pull the male plants as soon as they have shed their pollen, and to leave the female plants to ripen their seed, in which case the fibre of the female plants is much coarser. The treatment of H., by retting, &c., is similar to that of Flax (q. v.). The fibre of H. is generally used for coarser purposes than that of flax, particularly for sailcloth, pack-sheets, ropes, and the caulking of ships.

The seed of H. is produced in great abundance. It is commonly sold as food for eagles, birds; and birds are so fond of it, that not only the old fields, but the newly sown fields, must be carefully guarded against their depredations. A fixed oil, oil of hempseed, is obtained from it by expression, which is at first greenish yellow and afterwards yellow, and has an acrid odour, but a mild taste. This oil is used in Russia for burning in lamps, although the wick is apt to get clogged; also for making paints, varnish, and a kind of soft soap.

H. is cultivated in warm countries, and not much for its fibre as for a resinsous secretion, which has narcotic or intoxicating qualities. See Hashish.

H. is also used as a therapeutic agent under the name of Indian H., or Dhang. In this country, it is administered in the form of a tincture, a decoction, or a syrup, for its hypnotic, analgesic, and antispasmodic properties. Although less certain in its action than opium, it possesses those advantages over the drug—that it does not constipate the bowels, create nausea, or check the secretions, and that it is less likely to occasion headache.

The name Hemp (Ger. Hanf) is probably derived, along with the Greek and Latin Cannabis, from an oriental name, of which one form is the Arabic Kainuh. The name H. is often extended with some distinctive prefix to many of the fibres used for ropes and coarse fabrics, a practice which produces not a little confusion. Thus the fibre of Apocynaceae is called cannabinum (see Apocynaceae) is called Canadian H., as well as the plant itself; Bowstring H. (q. v.) is the fibre of the species of Sainseveria; Sunn (q. v.) is often called Sunn H.; it is also known as Bengal H., Bombay H., Madras H., and Brown H.; Jupurkork H. is the produce of another species of Crotalaria (q. v.); the fibre of H. (q. v.) is called Brown H. and Deckeep H. at Bombay; Maill H. of Abrac (q. v.) is the fibre of a Muss.

HEMPS, HOMS, or HUMS (Lat. Fomes), a city of Syria, is situated about a mile east of the right bank of the Orontes, in lat. about 34° 44' N., long. 36° 45' E. It is 60 miles north-east of Habbek and 110 miles west-north-west of Tyre. It is clean, compactly built, and surrounded by old walls; and although there are now no ancient buildings remaining, the antiquity of the city is attested by numerous fragments of columns, by several Greek inscriptions, and the foundations of ancient baths with specimens of mosaic pavement. In ancient times, it was chiefly celebrated for its splendid temple of the Sun, one of the priests of
HEMSTERHUIS—HENGSTENBERG.

which, Elagabalus or Heliogabalus, was raised to the imperial throne of Rome. Under the walls of H., Zenobia was defeated by the Emperor Aurelian in 272 A.D. In 636, the city was taken by the Saracen, when its old Semitic name H. was revived; and in 1999 the Crusaders role through its opened gates. Since then, H. has experienced many vicissitudes of fortune, all of which, however, it has survived, and is now the seat of a flourishing trade, and of several manufactures. Pop. between 20,000 and 30,000.

HEMSTERHUIS, TIBERIUS, a celebrated Dutch philologist, was born at Groningen, 9th January 1853. He became professor of Greek and of history at Leyden in 1740, where he died 7th April 1766. One of the greatest Greek scholars of his time, H. may be said to have created a new school of Greek philology, to which belong his distinguished pupils Ruhnken and Valkemaer. His editions of the Oeconomicus of Pollux (1706), of the Select Dialogus of Lucian (1708 and 1722), and of the Plutus of Aristophanes (1744, by Schäfer 1811), are his principal literary works. A beautiful picture of his life is given in Ruhnken's Elogium Hemsterhuisi (Leyd. 1768 and 1778), republished in Lindemann's Vite duumvirorum T. Hemsterhui et D. Ruhnkenii (Leip. 1822). From H.'s MSS, Anecdota Hemsterhuisiana (1825) have been edited by Geel, and Orationes et Epistolae (1839) by Friedemann.

HENBANE, HYPSCYMUS, a genus of plants of the natural order Solanaceae, having a five-toothed calyx, an irregular funnel-shaped corolla, and a capsule opening by a lid, and enclosed in the hardened calyx. The species are mostly annual and biennial herbaceous plants, and natives of the countries near the Mediterranean Sea. The only species found in Britain is the COMMON H. (H. niger), which is not uncommon in waste places, and

The seeds contain in largest quantity the peculiar alkaloid on which the properties of the plant chiefly depend, Hypocyamin or Hypocyamine, which crystallises in stellated acicular crystals of a silvery lustre. The symptoms of poisoning by H. are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine, H. is employed both internally and externally. It is gathered and dried to form a powder, or is taken internally. H. is sometimes employed instead of belladonna to dilate the pupil of the eye. Tincture and extract of H. are often administered in cases of annoying cough, spasmodic asthma, and other diseases requiring sedatives and antispasmodics. H. is also employed to calm mental irritation, and to induce sleep. For many cases, it has one great advantage over laudanum, in not producing constipation. The smoke from the burning seeds of H. is sometimes introduced into a curious tooth, to relieve toothache.

The other species of H. possess similar properties. The dried stalks of H. albus are used by smoking in Greece to allay toothache.

HENGST AND HORSA. See Anglo-SAXONS.

HEGSTENBERG, ERNST WILHELM, a celebrated modern German theologian, was born 29th October 1802, at Fröndenberg, in Westphalia, where his father was a clergyman. Prepared for the university, he devoted himself at Bonn chiefly to oriental and philosophical studies, whilst at the same time he took an enthusiastic part in the Young Germany. Though sympathising thus in his early years with liberal and rationalistic movements in Germany, soon after going to Basel, in 1823, he came under the influence of the missionary institution there, and, before he had begun the study of theology, was drawn into the theological tendency which he has since represented. Going to Berlin, in 1824, as theological Priedt-docent, he put himself at the head of a rising orthodox party, and has since, with most conscientious devotion, cultivated the scientific development of their principles, the aim of his labours in the university, and through the press. Though known as a theological author only by two little treatises—Cebcr d. Verhalt. d. inner Worts zum aussern (1825), and Uber Mysticismus, Pietismus und Separatismus (1826)—he was made, in 1826 extraordinary, in 1828 ordinary professor; and in 1829, doctor of theology. Through the press, his influence has been exerted chiefly as editor of the Evangelische Kirchenzeitung, which was begun in 1827, and still combats rationalism even in its mildest forms, seeking to restore the orthodoxy and church-discipline of the 16th and 17th centuries. With the same view are written all his principal works; his Christologie d. A. T. (3 Bde. 1829—1835; 2te Aufl. 1834—1857; Beiträge zur Einleitung ins A. T. (3 Bde. 1831—1839; Commentar über d. Psalmen (4 Bde. 1842—1845; 2te Aufl. 1850); Die Geschichte Bibliums u. Seiner Verfassers (1847), Das Heilige Psalmkönig (1853); and others are devoted to the defence of the old interpretation and criticism of the Scriptures against the results of modern biblical science in Germany. H.'s influence in ecclesiastical matters also, which was very great during the reign of the late king of Prussia, has been employed with thorough consistency in the direction of his theological tendencies, having been distinguished by a carrying out of the high Lutheran dogmas of the church, of church-offices, and of the sacraments, by

in the neighbourhood of towns and villages, particularly in calcareous soils, and on the sandy shores of Scotland. It is an annual or biennial plant, somewhat lanky, about two feet high; with large sinuated or sharply-lobed leaves without leaf stalk, and large dingy yellow flowers, with brownish-red or purplish veins. The whole plant is covered with unctuous hairs, and has a nauseous smell, which gives warning of its strong narcotic poisonous quality. Cases of poisoning by H. are, however, not rare; but are more frequently owing to the proceedings of quacks, than to any mistake of the plant as an esculent.
persecution of sectaries, by opposition to the union of Lutherans and Reformed, and by attempts to depose from their chairs Gesenius, Wegscheider, De Wette, and other rationalistic teachers in the universities. The success of the Liberal party in Prussia have, however, destroyed his influence.

HENNA, or HINNA, a name originally Arabic, and sometimes found with the Arabic article incorporated in the form Althenna or Althanna, belongs evidently to the Latin incursus and is of the natural order Lythraceae. They differ in little, but that the one is unarmled and the other thorny, the latter being also the larger plant. Many botanists unite them into one species, under the name L. alba. H. grows in moist situations throughout the north of Africa, Arabia, Persia, and the East Indies. It is cultivated in many places for the sake of its flowers, which are much prized for their fragrance, particularly by the Egyptian ladies; but still more for the sake of the leaves, which abound in colouring matter, and which, being dried, powdered, and made into a paste with hot water and catechu, are very generally employed by women throughout the east to stain the nails and tips of the fingers and to rouge the nails; also by taking off the beards, the orange colour being converted into a deep black by indigo; and for dyes of the manes and hoofs of horses, and to dye skins and leather reddish-yellow. Powdery H. leaves form a large article of export from Egypt to Persia, and to various parts of Turkey, from which they find their way to many northern countries, and even to Germany, to be employed in dyeing furs and some kinds of leather. The uses of staining the nails appear—from allusions in ancient poets, and from some of the Egyptian mummies—to have prevailed from very ancient times.

HENNEGAV. See Hainaut, or Hainault.

HENRY I., King of England, the youngest son of William the Conqueror, was born in 1068. When his brother, William II., was found dead in the New Forest, where they had both been hunting, on August 2, 1100, with a broken arrow in his breast, Prince Henry at once seized the reins of government, which, according to the then but imperfectly understood principles of primeval chivalry, should have passed into the hands of his elder brother Robert, Duke of Normandy, who was at the time in Italy, on his way home from crusading in Palestine. H. was crowned at Westminster, the third day after his brother's violent death. Regarding it he instituted no inquiry, possibly because he was privy to it; and he successfully held the crown against his brother Robert, at first negotiating with him, and granting him a pension to resign his pretensions, but finally making war upon his badly-governed duchy. Robert was defeated in a bloody battle before the walls of Tewkesbury, on September 28, 1186, taken prisoner, and shut up in Cardiff Castle during the remaining twenty-eight years of his life. The acquisition of Normandy, the ancient patrimony of his family, had been a point of ambition with H. as he despised England and the English; but he had some trouble in keeping it, as the French king, Louis VI., and the Counts of Anjou and Flanders, took part with William, Robert's youthful son, whose virtues and misfortunes secured him friends. H., however, brought over to himself the Count of Anjou, by betrothing his only son to the daughter of his brother, the King of Navarre; and by dexterity and fair promises, Pope Calixtus II., whose intervention in the interests of justice had been sought; and he defeated the French king and his mailed knights in the almost bloodless battle of Brennerville, in 1119. Next year his successes in arms and intrigue were darkened for life by the death of his only son William, who was drowned at sea on his passage from Normandy to England, unregretted by the English, who knew him towards them, his arrogance, and his gross vices. H. himself died from a surfeit of lampreys, on 1st December 1135, as he was preparing to leave Normandy, to repress an incursion of the Welsh. He was very angry that his brilliant grandson, who had married Geoffrey Plantagenet, the boy Count of Anjou, on the death of her first husband, Henry V., emperor of Germany, should succeed him on the throne, and had twice made the English nobles swear fealty to her; but on his death the crown was seized by Stephen of Blois, the son of Adela, the Conqueror's youngest daughter.

Henry I. was styled Beauchere, or the Scholar, in honour of his learning, which, for a king in his age, was not desecrating of distinction. He had great natural ability, especially in the line of state intrigue. Law was administered with considerable fairness, and not a little rigour, during his reign, and his administration restrained but did not prevent rebellion which had been seething incessantly since the Conquest. The punishment of crimes during his reign was capricious and barbarous; death, the loss of sight (which he is alleged to have inflicted more than once on his relatives), and perpetual imprisonment, being the most usual penalties of the law.

HENRY II. of England was the grandson of Henry I. by his daughter Matilda, and her second husband Geoffrey Plantagenet, and was born in 1133. His mother's use of H. for her illegitimate brother the Earl of Gloucester, in the early part of Stephen's reign, and towards its close by H. himself, had made war against Stephen, as a usurper, who had no good title to the throne. In 1153, when the rival armies were drawing near each other, a treaty for a compromise was set on foot, and in the course of it the only son of Stephen having died, it was agreed that Stephen should reign during his life, and that H. should succeed him, which he did at Stephen's death next year. He was crowned 19th December 1154, along with his Queen Eleanor, whom, at the age of eighteen, he had married within six weeks of her death, by Louis VII. of France. She was Countess of Poitou and Duchess of Aquitaine, in her own right. H. inherited from his father Anjou, Touraine, and Maine, and his father and mother succeeded by force of arms, in keeping and taking possession of Normandy for themselves and him; so that, by one method or another, he came to be possessed of a large portion of France as well as England. His chief rivals in power were the clergy, who could use their weapon of excommunication with terrible effect, and who being tried by their own courts were not amenable to the common laws of the realm, and were protected from the punishment due to their crimes, which were too often of the deepest dye. To aid him in reducing the church to subjection to the civil power, he appointed his trusted chancellor, Thomas a Becket, to the see of Canterbury, and compelled him and the other ecclesiastics to agree to the 'constitutions of Clarendon'; a set of laws enacted by a sort of prototype of a parliament, or council of the barons, and having for their object to render the crown and the civil law (such as it had grown to be) superior to the church. Becket, however, proved to be a true churchman, and the long and obstinate struggle between him and his monarch was only terminated by his murder. See BECKET, THOMAS A. H. did penance at his grave, allowing himself to be scourged by monks; but
HENRY III.—HENRY V.

through the Constitutions of Clarendon' were formal : speeded, the king was ultimately successful in recruiting the church to subordination in civil matters. During his reign, occurred the conquest of Ireland. That country was then the home of a number of tribes or clans of the ordinary feudal type, and Pope Adrian IV., in 1156, by a bull, gave Henry authority over the entire island, and ordered the inhabitants to obey him. He had not leisure at the time to conquer them, but afterwards, English and being solicited by one of the Irish petty kings, Dermot of Leinster, H. gave leave to any of his subjects to aid and helpfulness of the king. The Constable, constable of Albertivi, Maurice Fitzgerrald, and Richard de Clare, surnamed Strongbow, Earl of Striguil, went over with a very few hundred trained Englishmen, and sailed in the ship. They succeeded so well, that H. became jealous, and recalled them; and next year (1172) he went over himself, to conquer in a royal way, and was everywhere royally received, except in Ulster. This was the nominal conquest of Ireland, but the majority of the Irish tribes and chiefmen continued to be independent barbarians for centuries.

During this reign, also, the first considerable ascendency of England over Scotland was gained. H. was opposed by their jealous mother, Queen Eleanor, rebelled against him, and their cause was espoused by the kings of France and Scotland. The latter, William the Lion, was ravaging the north of England with an army, when he was surprised at Alnwick, taken prisoner, 12 July 1174. To obtain his liberty, he stipulated to do homage to H. for Scotland, to come for ever to him the fortresses of Roxburgh and Berwick, and the castle of Edinburgh for a limited time. In the course of this filial respect, the eldest son, Robert Fitzstephen, exhibiting great remorse, and Geoffrey was killed in a tournament at Paris. Richard, surnamed Cour de Lion, with King Philip of France, obtained some advantages over his father. A truce of peace was concluded between them, of which one of the stipulations was for an indemnity for all the followers of Richard. The sight of the name of his favourite son John in the list, acting upon a constitution weakness by many cares, then he into a fever, of which he died, 6th July 1189.

Upon the whole, H. was an able and enlightened sovereign. The barons were indeed overawed, but the monarch did not use his power despotsically. Lords' courts were established, and other improvements effected. The earliest writer on English law, Ranulph de Glanville, was H.'s chief justiciary. In intellect and character, he resembled his grandfather, Henry I., but his violations of the moral law were fewer, and less heinous. Still he had some illegitimate children, his mistress, the fair Rosamond, being the mother of two that are remembered : William Longsword, Earl of Salisbury, and Geoffrey, who became Archbishop of York, and who was faithful to him when his four legitimate sons took up arms against him.

HENRY III., of England, grandson of Henry II., and eldest son of King John, was born 1st October 1207, was successor to his father on his father's death at the age of ten. He inherited his father's weakness, and he managed everything ill both at home and abroad. A war with France cost him Ponto, and might have been more disastrous, but for the virtuous disposition of the French king, Louis IX., commonly called St. Louis. In his boyhood, under the direction of the judicious Earl of Pembroke, he ratified the Magna Charta; and he did so in manhood, to appease the discontent of his parliament, and obtain a weakening of money. But he kept no vows. He was beset with favourites chiefly from the country of his queen, Eleanor of Provence, and he allowed exorbitant exactions on the part of the clergy and the pope. His musulm roused the people and the barons in parliament, headed by his brother-in-law, Simon de Montfort, Earl of Leicester, who forced him to transfer his power to Robert Wadham. He agreed to this by the provisions of Oxford in 1259. The barons were somewhat tardy in reforming the state, and the king desired to regain a power which he alleged, with truth, had been taken from him by compulsion, through the weakness of an incapable will. The question of the validity of these provisions was submitted by both parties to St. Louis of France, whose conscientiousness was such that foreigners could not trust him. He held a council at Leicester and his party disregarded their agreement to be bound by his judgment, and took up arms against the king. They defeated him, and took him prisoner in the battle of Lewes, on 14th May 1264. The battle was followed by an agreement called the Mise of Lewes, more humiliating to the king than the provisions of Oxford. Leicester, being virtually king, summoned a sort of parliament; and to extend his popularity, which was already great, he undertook, as king of England, to try all cases, and this kind of representation was realised in embryo for the first time in English history. But his supremacy did not last long. Within a year, the powerful Earl of Gloucester deserted his party, and returned with the monarch, who was received with joy, and the fallen was restored. The king, who had been taken prisoner at Lewes, to escape from captivity. They led an overwhelming army against Leicester, who was defeated and slain at Evesham, on 4th August 1265. The king died 10th November 1272, and was succeeded by his son Edward. The weakness of H. and his father had allowed the development of the power of the barons, and the counterpoise of these two forces, feudal and aristocratic, was approached in these reigns by a method which has developed into the British parliament. Statute law dates from the time of Henry III.; the 'Provisions of Merton,' passed in the 20th year of H.'s reign, being the first enactment on the English statute-book.

HENRY IV., of the House of Lancaster, on the death of his cousin Richard II., in the parliament, usurped the crown in 1399, in the beginning of which year he had succeeded his father, John of Gaunt, in the duchy of Lancaster. He was surnamed Bolingbroke, from the place (in Lincolnshire) where he was born in 1366, and had no valid title to the crown, or the pretence of it, except that he was the son of the fourth son of Edward III. The peace of his reign was disturbed by the Welsh, under Owen Glendower (q.v.), and by the Scotch, who were defeated, however, at Naseby Moor on 22nd June, and at Homildon Hill on 14th September 1402. Henry Percy (surnamed Hotspur), the conqueror in the latter engagement, and his family shortly after broke with the king, and leagued with the Scotch Earl Douglas and Glendower against him; but this coalition was destroyed by the battle of Shrewsbury on 21st July 1403. Other two insurrections followed, which were easily suppressed. The king was griely despondent, and died, 2nd August 1413, in the 47th year of his age, having found a usurped crown to be a heavy burden, even for a strong head.

HENRY V., who succeeded his father Henry IV., was born at Monmouth (whence his surname), 1387. In his youth he had acquired great military distinction in open war against Glendower,
HENRY VI.—HENRY VII.

And after his military work was put an end to, through his father's jealousy and distrust of him, he became almost equally celebrated for dissipation. But when he became king (21st April 1413), he shook himself in great measure free of bad habits and companions, and in an endeavor at the outset of his reign to be both just and generous, he liberated from the confinement in which his father had placed him the young Earl of March, who was the true heir to the crown, and restored the son of Hotspur to the lands and honors which his father had lost by rebellion. He paid a tribute to religion also, or rather to the orthodoxy of the age, by persecuting the Lollards by fire and halter. The great effort of his reign was an attempted conquest of France, in which he virtually succeeded. He had no right to two English duchies, of which only force could support or preserve, gradually crumbled down. In 1428, they laid siege to Orleans, but the siege was raised next year by the French, inspired by Joan of Arc (q. v.); and although she was burned as a witch by the English in 1431, their power continued to decline. Normandy was completely lost by the fall of Cherbourg in 1450; and ultimately, in 1453, they were expelled from all France (Calais excepted), greatly to the true advantage of both that country and England.

Disputes between Gloucester, the regent, and his uncle, the powerful Bishop of Winchester, as well as war with France, prevailed during the minority of the king. As he grew up, he manifested no tendency to either virtuous or amoral activity. He inherited, in fact, the indolence of his grandfather, Charles VI. of France. In 1445, the weak king found a wife in the strong-minded Margaret of Anjou; and in 1447 the Winchester party, supported by her, succeeded in having Gloucester thrown into prison for high treason, where he was soon found dead in his bed, without external mark of violence, but most likely murdered, as Edward II. had been, by thrusting a red hot iron through his bowels, or by pouring a long stewed apple into his mouth, as his rival; and in 1450 the Duke of Suffolk, the queen's favorite minister, being impeached by the Commons, was condemned to be banished from the kingdom, but was shortly after taken, and executed on board one of the king's ships. The want of strength in the king, as well as in his title to the crown, was an invitation to every form of faction to display itself. Jack Cade, an Irish adventurer, who pretended to be Mortimer, disturbed a temporary possession of the king's estates; and the garrison overcame him and his pillaging followers, and he was taken and beheaded in a garden by the sheriff of Kent. The true representative of the Mortimers was Richard, Duke of York, and he was one of the unquiet spirits of the realm. As a descendant of Lionel, Duke of Clarence, the third son of Edward III., his title to the crown was inferior to that of the king, who was descended from the Duke of Lancaster, the son of Richard II., and he laid claim to the crown with more or less openness, according to circumstances. His influence and address was so great that in 1454, on the occasion of the king's weak mind being entirely eclipsed by the presence of two foreign ambassadors in parliament. On the king's recovery, he was indisposed to give up his power, and levied an army to maintain it. On May 22, 1455, the battle of St. Albans was fought, and the Yorkists were victorious; 5000 of the supporters of the House of Lancaster being killed, the Duke of Somerset, the queen's favorite minister for the time, being among them; and the king himself being taken prisoner. This was the first battle of twelve that was fought between the Houses of York and Lancaster, in the wars commonly called the Wars of the Roses, from the emblem of York being a white rose, and of Lancaster a red rose. (For a brief account of the struggle, see HENRY IV. He reigned 26 years, and his son Henry died May 22, 1422. In his cradle, he was proclaimed king of both France and England; but he lost both, having in intellect scarcely advanced from his cradle, all his days, though throughout amiable and pious.

HENRY VII., the conqueror and successor of Richard III., was born at Pembroke Castle, the seat of his father, the Earl of Pembroke, on January 21, 1456. His father, Edmund Tudor, was the son of Owen Tudor, and his wife, Queen Catherine, the widow of Henry V. His mother was a granddaughter of the dauphin, who was Richard, Duke of York, and he was one of the unquiet spirits of the realm. As a descendant of Lionel, Duke of Clarence, the third son of Edward III., his title to the crown was inferior to that of the king, who was descended from the Duke of Lancaster, the son of Richard II., and he laid claim to the crown with more or less openness, according to circumstances. HENRY VII.—HENRY VIII.

of John of Gaunt, parent of the House of Lancaster, and through her he derived his right (such as it was) to the crown. He was, indeed, the nearest heir, after Richard III., had murdered his nephews, the sons of Edward IV., except their sister Elizabeth, and Richard himself. The popular dislike at Richard's crime was so great in England, that H., while residing abroad and bearing the title of Earl of Richmond, was invited to invade England, and rescue it from the tyrant.

On the 22d of August, 1485, he landed at Milford Haven, and marched across the country to Bosworth, in Leicestershire, where a battle took place on the 22d of August, in which Richard was slain. H. now ascended the throne. His reign was troubled by several imports claiming the crown: first, Lambert Simnel, a joiner's son, who professed to be Earl of Warwick, was proclaimed king in Ireland, but was defeated at Stoke in 1487, taken prisoner, and turned into a scullion in the king's kitchen by H., who had a talent for turning everything to the most profitable purpose; second, Perkin Warbeck, who pretended to be the boy Duke of York, who had not been murdered in the Tower by Richard III., and was restored by the Duke of Burgundy, and supported by James IV. of Scotland, but was finally captured; and third, Ralph Walford, who also pretended to be Earl of Warwick, but did not succeed in carrying his enterprise far, being almost and certainly taken in 1490. This year H. raised an army, not apparently to free himself from further trouble from pretenders, had Warbeck, whom he had pardoned, and the true Earl of Warwick, a youth who had known captivity only all his days, convicted of a plot to recover the kingdom, and executed. The execution of the latter is the chief blot in H.'s conduct, but his execution of Lord Stanley, who had helped him to the throne, also showed a callous heart. Indeed this king was cunning and selfish, but prudent and not infrequent in revenge. In any view, except as avarice, which led him to sell offices and pardons, commuting sentences passed by his corrupt and infamous Exchequer judges, Empson and Dudley. His avarice kept him from engaging in foreign war, and he had a small quarrel with France being all that he attempted in that way. It also kept him from returning the dowry of Catharine of Aragon, who had married his son Arthur, Prince of Wales, a boy of 14, just before he died, and led him to betroth her to his next son, who became Henry VIII., a betrothal from which flowed most important consequences. He married his eldest daughter, Margaret, to James IV. of Scotland, foreseeing that it might bring about a union of the crowns, and this was one of the most fortunate and prudent schemes of his reign. His wife having died, he was engaged looking out for another for himself, with a large dowry, when he died of consumption, on April 22d, 1509. Bacon wrote a history of his reign, in which he represents him as a wise king, but does not conceal his avarice, explaining it rather by observing that the necessities and shifts of other great princes abroad set off to him the felicity of full coffers. Hume reckons his reign 'the dawn of civility and science' in England. Bacon says, that in it 'justice was well administered, save when the king was partie.' Some fresh light is thrown upon this and the preceding reign by a volume of state-papers recently published by Longman.

HENRY VIII., King of England, second son of Henry VII., and Elizabeth of York, was born in 1491. On the death of his elder brother Arthur in 1502, he became heir-apparent to the throne. In his twelfth year, he was betrothed to his brother's widow, Catharine of Aragon, sister of Philip I. of Spain, thus early commencing a union afterwards so fertile in evil-fortune. On his father's death, in 1509, H. was found to possess many accomplishments with no practical ability. Leaving Dudley and Empson, the instruments of his father's economic exertions, to fall a sacrifice to popular indulgence, he proceeded to squander his treasures to his own high and exorbitant purposes, and to the great content of his people. He indolently allowed his ministers to manage everything for him, even to his marriage with Catharine. But if he knew nothing of the foreign policy, he was a master of several languages with ease; and if he despised domestic business, never was there a monarch who presided more gracefully in the court, or behaved more gallantly at the jousts or in the hunting-field. His tastes were other than innocent. He, the country passionately fond of music and of display, and he indulged in no other excess than that of physical exercise, sometimes, it is said, exhausting four or five horses in the field in one day. It is especially worthy, that the early years of the king were spent with scarce a stain on the purity of his life.

For the first twenty years of his reign, England had no reason to be dissatisfied. The period, indeed, in which H. was king was always known (1513) there were two short wars with France, in which Turenne and Tournay were taken, and one in Scotland, with which the victory of Flodden was won. The following years were of that calm which is sometimes the case when the court is in the hands of a minister; and from 1515, when he was made Archbishop of York and chancellor, till his fall in 1529, he is wholly responsible for the government, and it was the best governed portion of H.'s reign. The foreign policy was in truth somewhat tortuous, guided to some extent, perhaps, by the aspirations of the cardinal to the triple crown; and it may be that, in his home-government, Wolsey often exhibited a Jesuitical preference for accomplishing his ends by dishonest means. The country, notwithstanding, was kept free from foreign embarrassments, and at home justice was administered.

Of the king, it cannot be said that during this period he did anything of consequence. When satiety and diminished means had checked the pursuit of his youth, he had betaken himself to those well-known theological studies which earned for him (1521) the honour of Defender of the Faith. His book, in defence of the seven sacraments, against Luther, although a work of some erudition, contributed nothing to the solution of the questions it touched. Timidity in examining received opinions was accompanied by corresponding vigour in denouncing those who, possessed of more courage, had proceeded from examination to dissent.

It is impossible not to connect these theological studies with the origin of the suit between H. and Catharine. The joyous temperament of H. had passed away, and in its place had come discontented gloom. In his now superstitions mind the fancy dwelt, that the early deaths of all his male children had been the judgment of Providence on some sin. From these dark thoughts the queen had not the power of conscious herself of the dawn of a regal prerogative. She was, her beauty had faded, and, haughty in her manners, she exacted all the stately etiquette of the Spanish court from one who had at no time felt for her more affection than was due to a bride selected for him by others. The nation, too, had grown dissatisfied with the union. The prospect of a succession left to be disputed around the person of a girl—the Princess Mary, who was the immediate heir—was viewed with anxiety. Men remembered the horrors of the wars of the Roses, and feared that their children might see them repeated. The doubt as to the "ability of
HENRY VIII.

His marriage with his brother's widow, which had been started at the time of its celebration, was one certain to be revived on the slightest occasion. A strange mixture of public spirit, religious or superstitious feeling, and selfish desire, now determined H. to seek a divorce.

In suing for the divorce, the king unexpectedly found a zealous assistant. Wolsey saw in it a means of detaching England from the alliance with Spain, and for promoting his private ends. He gave his assent willingly. When the bills became law, they were received by the people with great satisfaction.

Though these measures were significant enough of what might follow from his refusal, the pope still delayed. Time was suffered to wear on, and nothing made progress except the unpopularity of the clergy. Rome still shewing no symptoms of yielding, the king's political necessities again made him a reformer, and that of a very unscrupulous kind. He imposed a heavy fine on the clergy, under an old statute, for having recognised the legatine authority of Wolsey without express royal sanction. Going still further, the Defender of the Faith declared himself the head of the church, and in the clergy to recognize the title in consideration of his graciously remitting a portion of their fine (22 Hen. VIII., c. 15).

Parliament having again met (1530), advantage was taken of the king's disposition still more to advance the claims of the crown. The clergy were forced the state to give up to them the right to try their brethren when accused of crimes. Their theory was, that he on whom consecration had wrought its mystic office, was too high for the secular arm. The practice was, that every one who claimed the character of clerk, from the highest dignitaries of the church to the crowds of mendicant friars, escaped with small fines after committing the gravest crimes. Parliament was thought to have gone far when it enacted that all below the rank of priest should be dealt with by the ordinary courts of the realm. The same parliament passed other acts, regulating the jurisdiction of the ecclesiastical courts, and making stricter provisions against bequests to the church.

These measures, bold and unusual as they were, affected Rome only indirectly. As it was evident that something to be more closely felt was one of the pope's highest and most lucrative privileges was attacked. The pope had long maintained that no high ecclesiastical dignity could be conferred without his approval, and in return for granting it, he received the first year's fruits of the benefice. The claims of the pope, called annates, amounted to a large sum, increased even beyond its legitimate amount by the dishonourable expedient of sanctioning the appointment of none but very old men. A bill passed both houses abolishing these payments (23 Hen. VIII., c. 20). To make the measure serve its purpose more effectually, power was given to the king to call it into effect at any future time, while the hope was privately held out that this power would not be exercised if the divorce were granted.

While such measures were being passed, it may be believed that Sir Thomas More held office with pain and reluctance. Finding at last his influence waning, but remaining at the court, and powerless to abate the predominant-influence of the romish element, he resigned, and a ministry was formed (1532) of which Cromwell was now the nominal as well as real head. The new ministry were prepared to push measures as far as possible to the cleavage of the church and the nation would permit. They desired nothing better than an open rupture with Rome. H., on the other hand, exhausted every effort of diplomacy to preserve the alliance with the church. Embassies, intrigues, plots of all kind, in Paris and
HENRY VIII.

Borne, shrouded in endless confusion at this time, making it impossible to determine the immediate cause of the separation, long since certain to ensue.

In the beginning of 1533, H. was impatient at the long delay, or as others say, and as the dates render not improbable, discovering that an illicit intercourse he carried on with Anne Boleyn had resulted in her pregnancy, was privately married to her. Within three months afterwards, the marriage was made public; and to complete matters, Cranmer, recently appointed Archbishop of Canterbury, held a court, as the highest ecclesiastical authority in England, and pronounced sentence of divorce, declaring the marriage of H. and Catharine to have been null from the beginning. In England these doings were accompanied by much rejoicing, and the king's former taste for pageantry revived in the magnificent ceremonial of crowning his new queen.

The news produced other effects in Italy and Germany. When the news of the marriage reached the Vatican, H. was cited to appear before the papal court. He refused, and appealed to a general council. When Cranmer's sentence reached Rome, the pope at once declared it illegal, and soon after, almost closed the door for further negotiation by rejecting the appeal to the court. On each side were taken almost simultaneously. The English parliament met, and under Cromwell's guidance, far outbid its predecessors. It passed an act entirely abolishing the papal authority within the realm (31 Hen. VIII. c. 13), giving the king, as on a former occasion, power to call the act into operation when he pleased. It then settled the succession on the issue of Anne Boleyn, to the exclusion of that of Catharine. Scarcely had the memory of these acts been completely effaced, when news came from Rome that the pope had pronounced judgment in the long pending divorce case, finding H.'s marriage to Catharine to have been valid. On the day following, H. called into operation the act abolishing the pope's authority.

H. having as yet done comparatively little to forfeit his early popularity, the sympathy of most was with him in the steps taken against those of his subjects who were disaffected with these changes. Among these steps, however, were some not easily defended, even according to the standard of the times. Minor victims fell unheeded, but all did shocked when (Bishop of Rochester) were put to death for refusing to acknowledge the new succession, and to admit the king's right to the headship of the church. Even Henry's ally, Francis I, remonstrated. The worst effect of the cruelty was the alienation of the German Protestants, who ever afterwards held aloof from H. in spite of all Cromwell's efforts to cement an alliance. After this and other similar acts, which were not unfrequent, it may be said that H. never again received human sympathy. He pursued his course, however, aided by those from whom the dust of the conflict concealed his cruelty.

The state of the monasteries having long been a public scandal, Cromwell (1535) sent a commission to examine them. Acting on the reports of the commission, parliament abolished the smaller monasteries, which happened to be at once the weakest and the worst (27 Hen. VIII. c. 28). The disbanded monks made a large addition, both directly and indirectly, to the ranks of the disaffected; and to create further discontent, the swarms of vagabonds who had nested in the monasteries, were suddenly thrown for support on the yeomen.

The disaffection burst out in the rebellion known as the Pilgrimage of Grace (1536). Crowds who had collected in Lincolnshire with hardly a definite aim dispersed on the promise of redress a parliament to be held at York. Redress, however, came not, and the crowds again gathered; more skillful leaders, and with more definite purposes. The king's forces sent against them were insufficient. The whole of the north of England was in the hands of the rebels. Their grievances were as manifold as they were numerous. Even regarding the tenure of land were mixed with complaints that low-born men (such as Cromwell) advised the king, that the monasteries were being dissolved, and that the old faith was being altered. H., through certain commissioners, again negotiated with the insurgents, and terms were agreed on, the most important of which was a general amnesty, the benefit of which, however, Aske and the other leaders did not receive. The suppression of this rebellion was followed by the dissolution (1537) of the larger monasteries (31 Hen. VIII. c. 13).

In the midst of these civil commotions, two events took place both bearing on the Reformation, but of very different import. An order in council (1537) appointed the English translation of the Bible to be placed in every church, that all might read it. But as if to correct the idea that every one who possessed it was a rebel, the next step of the king was to declare, in religious questions, an act of uniformity was passed. H. having now broken with many old professions, reduced his new professions to a creed, to be enforced by penalties, if more rational means should fail to commend it to the nation. Certain articles of religion were drawn up, and after some modifications, were framed into those known as the "bloody six articles." The statute (31 Hen. VIII.) containing these articles—namely, was as much simplicity: 'An act for abolishing diversity of Opinions'—is very brief, but very formidable. The doctrines were substantially those of the Roman Catholic Church. The articles made no pretensions to form a complete or systematic creed; they embodied the points as to which most conflict of opinion prevailed; and formidable, indeed, were the sanctions enforcing them. Whoever denied the first article (that embodying the doctrine of transubstantiation) was to be declared a heretic, and burned without opportunity of abjuration; whoever spoke against the other five articles should, for the first offence, forfeit his property; and whoever repeated the words of the church of England, in the second, was to die like a felon. To this act Cromwell himself fell a victim. He had been silent in face of the combination which carried it; but having secretly used all his influence as a member of government to thwart its execution, by staying proceedings and giving parliaments, he lost H.'s confidence, and was put to death.

The last years of the reign of H. were disturbed with small wars with Scotland and France, imminent to progress. He died on 28th January 1547, unembroidered, unmourned; and yet few rejoiced, for his policy had left England so divided at home, so friendless abroad, that no man could look with confidence to the future.

The character of H. has of late been discussed at greater length than the subject deserved. The mere recital of the occurrences of his private life is sufficient to justify most of the infamy which tradition has attached to his name. The divorce of Catharine and the marriage of Anne Boleyn have already been told. Within a short time after the birth of the Princess (afterwards Queen) Elizabeth, H. was dead. To fill up the blank of her father's reign, it may be said, that the great men of the age, Lincolns, Cranmer, and others, were men of great ability, but not, it must be admitted, without ground—of ad- tury, and, after a hurried trial, had her condemned and executed (1536). On the day after the execution,
HENRY II—HENRY III.

he married Jane Seymour, against whom nothing more is known than that she was the king's partner in this revolving proceeding. Jane Seymour died (1537) in giving birth to Edward VI. The story of Anne of Cleves follows. The marriage, a political one, arranged by Cromwell to connect H. with the German Protestants, was unfortunate from the beginning. H. was deceived as to her personal attractions, as she was learned but ugly and domineering. His fifth wife, Catharine Howard, was (1541) within a few months divorced and executed for an adultery well-enough established. His sixth wife, Catharine Parr, survived him, and so the tedious girls, 20 being then the domestic circle to that of his immediate associates, H. is found as incapable of friendship as he was either of feeling or of evoking love. He had three great ministers—Wolsey, More, and Cromwell—all men of ambitious designs of the English government, the closest intimacy with the king, yet all in the hour of need thrown aside. Disease and a broken spirit saved Wolsey from a worse fate; but it is little wonder that every Catholic should detest the memory of the man. H. was too weak for adhering to opinions which he himself had held shortly before, or that Protestants should execrate the memory of the man who violated justice and conscience, and sought to put to death the first great Protestant minister. If such were the motives he vouchsafed to those with whom he dealt, it may easily be imagined how he dealt with those who were against him. Claims of political necessity cannot excuse the cruelty with which he persecuted every relative of Cardinal Pole, from the aged Countess of Salisbury to lesser victims. It may, however, be safely admitted, that tradition has exaggerated H.'s cruelties—that there is no truth, for example, in the tale which gives him 32,000 as the number of wounds in his reign; and it may be further admitted, that he did not wantonly commit murders—that he had always before him in his crimes some object, either of misconceived justice, or of policy; but after allowing for everything, enough remains to explain the universal detestation in which Protestant and Catholic have combined to hold his name.

HENRY II, King of France, was born in 1518; married Catharine de' Medici in 1533; succeeded his father, Francis I., in 1547; and, by his father left was rapidly squandered among his favourites and mistresses. A revolt in Guenee, where the people had risen against the galbenards, or collectors of the salt-duty, was the first event that raised the king and court from their sublist ease. This disturbance was, however, speedily put down by Montmorency. Through the influence of the Guises, whose sister, the dowager-queen of James V., sought the aid of France to support her against the Duke d'Alençon, the Duke d'Alençon was declared against England, which began in 1559 with the recovery of Bologne, and ended in 1558 with the taking of Calais, after the city had been 210 years in the hands of the English. Curiously enough, while the king tried to put down heresy with fire and sword at home, he made treaties of alliance with the German reformers, and was finally aroused by an expedition of Saxony against the emperor; and taking the command in person, made himself master of Toul and Verdun, while Montmorency, through the treachery of the garrison, seized upon Metz. After the abdication of Charles V. (1556), and the division of his vast empire between his brother Ferdinand and his son Philip II., H. seized the opportune occasion of attacking the Netherlands and Italy before Philip II. had time to consolidate his newly acquired powers, but the results of this step were disastrous to France at every point. In Italy, the attack on Naples, made by Guise at the head of 20,000 men, utterly failed through the pusillanimity of the pope, and the energetic advance of Alva; while in the Low Countries, the French under Montmorency sustained a total defeat, in 1557, at St Quentin, where the flower of the French chivalry were either taken or taken prisoner by the troops of Philip, who were commanded by Philibert-Emmanuel, Duke of Savoy.

These reverses were followed by the treaty of Chateau-Cambresis (1559), in which H. agreed, in exchange for the restoration of Ham, St Quentin, and Castellet, and the liberation of Montmorency, to resign nearly all his conquests in the Low Countries, Piedmont, and Southern Italy, including 190 fortresses and strongholds. Shortly after, he was mortally wounded by the troops of the Protestants, who were commanded by Philibert-Emmanuel, Duke of Savoy.

HENRY III, the third son of Henry II. and Catharine de' Medici, was succeeded by his brother Charles IX. in 1574. On the death of the Constable Montmorency, he received the chief command of the army, and his first campaign, fought in his 16th year, was signalled by two decisive victories, gained over the Protestant troopers at Jarnac and Montmorent. In 1573, the intrigues of the queen-regent secured to him the election to the vacant throne of Poland. He failed, however, to secure the attachment of the Polish nobles; and, the streets of Paris being in the hands of the Protestants, he was compelled to flee to Cracow, on his return to France, was proclaimed king of that country. His mother and the; crown had little difficulty in persuading him to continue the religious civil war. The union of the Protestants with the party of discontented nobles, headed by the king's brother, the Duke d'Alençon, compelled the alarmed sovereign to grant the former the free exercise of their religion, and various other rights. The Protestants were the Catholic party, who, headed by Henry of Guise, formed the confederation known as the Sainte Ligue, the object of which was not merely to assert the undivided supremacy of Catholicism, but also to recover the reverting of the throne to Guise, and civil war again and again burst out with renewed violence.

H. avoided himself of his intervals of quiet to indulge his own vicious propensities; and while his mother ruled the state, and the Guises were undermining his throne, his days and nights were spent in an alternation of the most dastardly excesses, and the wildest outbreaks of fanaticism. One day he might be seen passing, to the sound of music, through the streets of Paris, accompanied by a band of young men as effeminate as himself, known as the Magnons, and surrounded by parrots, monkeys, and pet dogs, while the next day he and his companions would show themselves clad in a penitent's dress, wearing masks, and carrying in their hands swords, with which they flangellated one another as they sang aloud penitent psalms.

The assassination of the Duke of Guise in 1588 and the revolution of the nation.---The doctors of the Sorbonne declared the people to be relieved of the duty of obedience to the king, and the Leaguers dissolved the parliament. H., who was now, for the first time, thrown on his own resources—his mother had just died—was distracted by the difficulties of his position; and in his perplexity at hearing that Guise's brother, the Duke of Mayenne, had been declared lieutenant-general of the kingdom, threw himself under the protection of Henry
HENRY IV.

of Navarre. The newly reconciled kings advanced at the head of 40,000 Huguenots on Paris, which, although gallantly defended by Mayenne, would probably have had to capitulate had not the current of events been suddenly checked through the agency of a fanatical young dominican-brother, named Jacques Clement, who, on 1st August 1589, on pretence of having important tidings to communicate to H., killed him by plunging a knife into his body. The murderer was slain on the spot by the royal guard, and his victim died the following day, after having declared his kinsman, Henry Bourbon of Navarre, his successor.

HENRY IV. King of France and Navarre, surnamed 'The Great,' and 'The Good,' was born in Bearn in 1553. H. was the third son of Antoine de Bourbon and Jeanne d'Albret, daughter and heiress of Henry, King of Navarre and Bearn. His father's death placed him under the sole control of his mother and grandfather, at whose court he was trained to the practice of knighthly and athletic exercises, and inured to the active habits and rude fare common to the Bernois mountaineers. His mother, a jealous Caristian, was careful to select learned men holding her own tenets for his instructors; and having discovered that a plot was brooking to remove him to Spain by force, to train him into a dominican, she exhorted him, in 1570, to La Rochelle, and presented him to the assembled Huguenot army, with whom he participated in the battle of Jarnac. H. was now chosen chief of the Protestant party, although, on account of his principal connection, he was vessel to Coligny (q. v.). Notwithstanding the defection which the Huguenots had experienced in this campaign, the peace of St Germain which followed was apparently most advantageous to their cause, and a new and almost unconstrained contract of marriage between H. and Margaret of Valois, the sister of Charles IX. After much opposition on the part both of Catholicks and Protestants, the marriage was celebrated with great pomp in 1572, two months after the sudden death of the Queen Jeanne, which was probably due to poison, and within less than a week of the massacre of St Bartholomew. It had been originally intended that H. was to share at the rate of the dissolved friends and co-religionists, but his life was spared on condition of his professing himself a Catholick. Three years he remained at the French court, virtually a prisoner; but at length, in 1576, H. contrived to elude the vigilant watchfulness of his father and escaped by the camp of the Huguenots in Alencon, where, having revoked his compulsory conversion, he resumed the command of the army, and by his address gained several signal advantages, which constrained the king to consent to a peace highly favourable to the cause of the reformers. The death of the Duke of Anjou (late Alencon) gave H. the rank as first prince of the blood-royal, of presumptive heir to the crown, while the murder of Henry II., in 1589, made him, in right of the Salic law, and as the nearest male descendant of the royal house of France, rightful king of France. As a Protestant, lying under the ban of papal excommunication, he was obliged to seek the greater part of the succeeding period at the court of the Duke of Lorraine and Savoy, and Philip II. of Spain, were prepared each on his own account, to dispute his claims, he retired to the south until he could collect more trustworthy forces; but the interest of his country and the interests of the kingdom, and thus still further complicated the interests of their party. In 1590, H. won a splendid victory over Mayenne at Ivry. In 1593, the assembly of the States-general, by rejecting the pretensions of Philip II., and insisting on the marriage of Esterhazy to his niece, 'the daughter of Henry III.,' notwithstanding her exclusion by the Salic law, proclaimed the aged Cardinal Bourbon king, with the Duke of Mayenne lieutenant-general of the kingdom, and thus still further complicated the interests of their party. HENRY III.—HENRY IV.

children which they bore him, were a scandal to the nation, and a source of impoverishing embarrassment to the government. As authorities in regard to Henry II., III., and IV., in addition to the general history of France, the following works may be consulted: Auquetil, Esprit de la Légue; Petitot’s Collection of Mémoires; De la Sausaye, Histoire de Bouc; Documents de l’Hist. de France; Matthieu, Hist. de Henri IV.; Memoirs and Letters of De Thou, D’Aubigné, Pasquier, Duplessis Monceau; Caplige, Hist. de la Réforme et de la Légue; Pétitie, Hist. de Henri IV.

HENRY III., Emperor of Germany, of the Saxon Franconian line, and the son of the Emperor Conrad II., was born in 1017, elected king of the Germans in 1026, Duke of Bavaria in 1027, Duke of Swaziz and Burgundy in 1027, succeeding his father as emperor in 1039, and died in 1056. H., who was possessed of natural abilities, which had been cultivated as far as the age permitted, was one of the most enterprising and efficient rulers of Germany. By his vigour he maintained his ascendency notwithstanding the encroachments of the church and the subordination of the princes of the empire. Having summoned a council at Sutri in 1046, he availed himself of the influence and acquires in Italy, by his judicious reconciliation of antagonist parties, to secure the recognition of a new pope, Clement II., and thus brought to an end the scandalous disquisitions which were disturbing Christianity through the intrigues of three rival popes, Benedict IX., Sylvester III., and Gregory V. By his energetic maintenance of the integrity of the empire, he gained opportunities of adding new territories to the imperial states, for having retaliated on the Duke of Bohemia for the hostilities which he had carried on against the Poles during the intestine disorders of Poland, his decisive successes compelled the Bohemian duke to acknowledge himself vassal of the empire; while H.’s campaign against Hungary had a similar result, terminating in 1047 in the recognition of the supreme power of the emperor over the kings of Hungary. He also secured powerful vassals in Italy, in the Norman conquerors of Apulia and Calabria.

H. devoted the short intervals of peace which he enjoyed to the eradication of numerous abuses in the church, but his schemes of ecclesiastical reform were secretly frustrated by Hildebrand, afterwards Gregory VII. (q.v.); and on the death of H., who is supposed to have been poisoned, the papal chair was found to have already entered upon decisive measures for its emancipation from imperial influence. H. distinguished himself as the zealous promoter of learning and the arts, especially music. He also founded numerous monastic schools, over which he placed learned monks of Brittany, and built several churches, and the cathedrals of Worms, Mayence, and Spires, in the last of which he was interred.

HENRY IV., Emperor of Germany, the son and successor of the former, was born in 1056, elected king of the Germans in 1054, during the lifetime of his father, crowned emperor 1054, and died 1106. As he was only five years old at the death of his father, the regency was in accordance with the wishes of the latter, confided to the child’s mother, Agnes of Poitiers. H.’s perpetual quarrels with the Saxon princes and peers occupied his best years, and were the principal cause of the subsequent quarrels through which each was involved with a memorable interest to his history. Unhappily for him, he was invaded in 1074, after having suffered defeat and various insults at the hands of his Saxon vassals, to appeal to the pope for his intervention; and Gregory VII., who was only too happy to have an opportunity of interfering in the matter, dispatched plebepotentiaries to settle the differences in Saxony, and availing himself of the occasion to prosecute his own plans, commanded the king to abstain from the sale and granting of benefices while this quarrel was pending. Before these directions reached Germany, H. had, however, settled his own affairs by defeating the Saxon insurgents in a great battle, Pasquier, taking their princes captive, and отзывы all the parts which they had devastated; while his councilors had prosecuted a vigorous business in the interdicted sale of benefices. H. not only approved their conduct, but responded to the pope’s remonstrances on the subject, and his summons for his appearance at Rome, by declaring, through an assembly of German bishops and abbots, which met at Worms in 1076, that the pontiff was deposed. Gregory VII. retaliated by excommunicating and deposing H., and absolving his subjects from all future obedience towards him. The king at first made light of the sentence, but when he found his vassals and princes gradually falling away from their allegiance, while the elections held at a diet in the spring of 1077, they declared that unless the ban were removed within a twelvemonth, they would deprive him of the crown, he submitted; and accompanied only by his faithful consent and the eldest son, he hastened, under grievous difficulties, in midwinter, to Italy, where he sought the pope. For three days in January 1077, H., barefooted, and clothed only in the haircloth shirt of a penitent, was compelled to stand without the castle gates of Canossa, exposed to the inclemency of the weather, before the pontiff consented to remove the ban of excommunication.

After this event, H.’s courage and resentment speedily revived; and having found adherents among the Lombards, he began a conflict against the papal power, chiefly in regard to the right of investiture, in which he was generally successful. Gregory again excommunicated H., who, as usual, retaliated by electing a new pope, Clement III. Fastening over the Alps, he laid siege to Rome. Gregory took refuge in the castle of St. Angelo, and H. caused himself to be crowned emperor by the anti-pope. It was now that Hermann of Luxemburg had, during his absence, been elected king of Germany, he hastily left Rome to regain his lost power. For the third time H. crossed the Alps in 1090, and he had already succeeded in raising the fortunes of his friend, Clement III., taken Manta, and gained many victories over the Guelfic princes and their favourite pope, Urban II., when he suddenly learned that his son Conrad had joined his enemies, and been crowned king at Monza. H.’s despair on hearing of these acts of rebellion nearly unsettled his reason, and having retired to one of his Lombard castles, he remained for several years in seclusion; but at length rousing himself from his lethargy, he returned in 1096 to Germany, where the princes and people now vied with one another to shew him their sympathy and good-will. By his own request, his second son, Henry, was elected king of the Germans, and his successor in the empire. This prince, however, having been induced to rise against his father by Pope Pascal II., took him prisoner, and forcibly compelled him to abdicate. The emperor escaped from his prison, and found friends and safety at Liege, where he died, August 7, 1106, while preparing another army to continue the struggle. See, for the lives of Henry III. and IV., Adamus Bremenensis, Historia Ecclesiastica; Siemundi, Italian Republics; and Europe during the Middle Ages;
HENRY.
